

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE Motor-Car Journal.

VOL. II.]

LONDON, FRIDAY, MARCH 9, 1900.

[No. 53.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WITH the present issue the *Motor-Car Journal* commences its second volume. Established a year ago its success has never been in doubt. The first number was received with favour by all interested in automobilism, and that early welcome has increased in cordiality as the months have passed by until, to-day, its position in the journalistic circles concerned with automobilism is assured and acknow-

ledged. Such a result has been extremely gratifying as evidencing widespread interest in motor-car matters, and we are all the more pleased because it has been won without any lessened friendliness from other journals previously associated with the industry. We have sought not only to assist the growing number of motor-carists by early information of improvements, and by the interchange of ideas on practical points, but we have (in a serious effort to interest all classes of people in automobilism) done something to help forward the popularisation of the new means of locomotion on common roads.

The Motor-Car Journal.

REGARDING the function of a paper catering for a new industry as being of a twofold character, we have endeavoured to act up to that ideal; first by devoting space to technical matters of interest to the practical motorist; second, by en-

deavouring to attract Society and commercial people to the ranks of automobilists by regular publication of its progress and frequent demonstrations of its service. With what success this has been done the subscription list of the *Motor-Car Journal* is ample testimony. For within the space of one year practically every automobilist in Great Britain and Ireland has shown his or her favour, while in the United States, several of our colonies, France, Belgium, Italy, Switzerland, Germany, Austria, Hungary, Russia, Roumania, and other countries we have subscribers who follow the doings of the motor-car world with interest and keen concern. Not only is this a matter of personal satisfaction, but it must prove encouraging to all our readers who will accept the extending influence of this journal as further proof of the growing importance of the automobile.

A Glance Back.

A GLANCE at the index to Volume I. (which is shortly to be published) will afford some idea of the variety of matters which have been dealt with during the past year. Our view has not been wholly insular, although we

have taken particular care to chronicle everything of interest with regard to the doings of British manufacturers. We have watched developments on the Continent and in the United States, and whenever improvements have seemed of value have given them space in our columns—criticising with freedom and with fairness points of construction and matters of moment.

Events of social importance and business concern have been chronicled with impartiality, and, altogether, the first year's history of the *Journal* can be reviewed with a very pleasant feeling. We would take this opportunity of thanking our regular staff of correspondents for their efficient and prompt services, and also express our obligations to the many thoughtful readers who by early communication of tours, experiences, and similar incidents have enabled us to render our pages of general usefulness and interest. With such help equally well rendered in the future the *Motor-Car Journal* looks forward with hopeful anticipations of the progress of the industry and sport with which it is intimately associated.

In the Future.

WITH regard to the future every effort will be made not only to retain but also to extend the prestige already possessed. The full record we shall give of the Automobile Club's Exhibition will be of permanent interest, the chronicle of the great tour of 1,000 miles will demonstrate the reliability of the automobile, and the arrangements in progress for recording runs and tours will add to the interest of our columns during the summer months. In this work we bespeak the help of our readers, who, by supplying notes of pleasant trips, with practical information as to tolls, hotels, etc., can materially add to the enjoyment of other motorists. That is a department of never-ending attractiveness, and it is a department in which the *Motor-Car Journal* will not lag behind. And here this personal note must stop; the fact that this is our journalistic birthday—so far as automobilism is concerned—must be accepted as an extenuating circumstance.

The 1,000-Mile Automobile Trial.

As the date of the Automobile Club's 1,000-mile trial comes nearer interest in the event appears not only to be maintained, but to be increasing, and during the past week or so quite a number of additional entries have been received. In Section I. (manufacturers) the list now numbers fifty different vehicles, the recent additions comprising a victoria by the International Motor Company, a car by the S.S. Motor Company, two vehicles by the Southern Motor Car Company, a voiturette by Messrs. Humber and Co., and a car and a Renault tricycle by Messrs. Marshall and Co. Turning to Section II. (privately-owned motor-vehicles), the list now shows twenty-five entries, the latest accessions being a 12-h.p. Daimler by Mr. J. A. Holder, a car by Mr. R. E. Phillips, and a 6-h.p. Daimler Parisian car by Mr. W. Exe. It will thus be seen that altogether no less than seventy-five vehicles have already been entered, and it is expected that ere the list is closed this number will be increased to fully a hundred. We have this week received an advanced copy of the official programme of the trial; this is a most elaborate production, and practically forms a book of instructions for all who will take part in the test. Each day's journey is mapped out in clear type, with instructions as to speed, stopping, etc., set out in the margin. Useful lists of hotels and petrol stores in the different towns passed through are included in the programme, while four pages are devoted to a list of the vehicles entered, with blank

columns in which to insert the average speed attained on each day's run, thus enabling a record to be kept of the performances of each and every car. In connection with the tour special road maps are being published which, enclosed in neat cases, can be fixed on the cars and so give the driver a view of his route for several succeeding miles.

Some Additional Rules.

At a meeting of the Standing Committee of the Automobile Club a few days ago, further matters in connection with the trial were dealt with, and the following additions to the rules were recommended:—(a) "Sprocket wheels shall not be changed during the course of a running day." (b) "Any alteration, temporary or otherwise, in the load or the number of passengers during a hill-climbing trial shall be declared by the driver to the next timekeeper." The intention of the first of these new rules is to prevent the changing of sprockets; say, for instance, at Kendal on the afternoon of the April 30th, as the record made with a large sprocket over the fairly flat country between Manchester and Kendal, and the record made with a small sprocket on the ascent of Shap Fell, would not properly represent the powers of the car unless the change of sprockets were recorded.

The Late Herr Daimler.

ELSEWHERE we record the main incidents in the life of the late Herr Daimler, whose untiring work in connection with automobilism worthily placed him at the head of the modern automobile movement—a fact we recognised by publishing his biography and portrait in the very first number of the *Motor-Car Journal*. It is a sad coincidence that in the first number of our second volume we reproduce that photograph, that our readers may see the features of the deceased gentleman. His work is not likely to be forgotten wherever automobilism has adherents, and we understand the question of the erection of a statue at Cannstatt, where birth was given to the Daimler motor, will shortly be raised, while an appeal will probably be made by Mr. F. R. Simms for the purpose of having a bas relief of the illustrious inventor placed on the walls of the Automobile Club of Great Britain.

M. Rene de Knyff's Wonderful Speed.

IN our last issue we drew attention to the wonderful average speed of 43½ miles per hour for nearly five hours in the recent "Circuit du Sud-Ouest" race. M. Knyff was driving his so-called 16 h.p. Panhard on which he won the "Tour de France" last summer. *La France Automobile* of the 1st March states that the engine has been altered, and that the electric and tube ignition are both used at the same time and that the low speed is 17 kilomètres (10·5 miles) and the high speed 65 kilomètres (40·3 miles) at 720 revolutions to the minute. M. de Knyff is reported to have covered the first 55 kilomètres in the incredibly short time of 33½ minutes (2 over 60 miles per hour). The weight of the vehicle is about 2,024 lbs. The wheels are 35·4 inches and 43·3 inches diameter and fitted with pneumatic tires 3·5 inches and 4·7 inches.

The Relief of Ladysmith.

NOT the least important and observed of those who participated in celebrating the relief of Ladysmith on Thursday last week in London was a young gentleman who, seated upon a Decauville motor-car, gaily bedecked with bunting, headed a huge procession which passed through the crowded thoroughfares of the West End. At various positions *en route*, notably in Trafalgar Square, the driver came to a standstill, and, standing up in his car, with an immense crowd around him, led, with powerful voice, the cheering for Buller, for Roberts, and indeed for everybody else of whom at the moment he could think. Then the procession reformed, and headed by the ubiquitous motor-car and the enterprising young Briton, it finally arrived at the War

Office, where again he called forth cheers for everybody concerned in the relief of Ladysmith and the Empire. It really seemed as if the throng would stand there all the night yelling and cheering with lungs of iron. But of a sudden an inspector performed his reluctant duty, and the autocarist had to "git."

Circulating the Good News.

THE good news of the Relief of Ladysmith was circulated rapidly in the Warwickshire district by means of the automobile, Mr. George Iden, the manager of the Motor Manufacturing Company, Limited, placing a couple of cars at the disposal of a Coventry daily for use in the prompt distribution of a special addition along the countryside. One of the cars covered the distance between Coventry and Bulkington, running down the Old Roman fosseway to Bretford, Wolvey, Brandon, and so home, whilst the other traversed many miles in the Meriden and Berkswell districts. Everywhere the good news and the cars—one a Princess voiturette and the other a dog cart with Daimler motor—were met with enthusiasm, and the papers eagerly purchased.

Glasgow Exhibition, 1901.

REFERENCE was made in our last issue to the exhibition to be held at Glasgow in 1901, and the invitation that was officially extended to automobilists to participate therein. Before the committee which was appointed to consider the matter, Mr. S. F. Edge restated the view that met with acceptance at the meeting of manufacturers, and it was unanimously resolved that "it be recommended that as a matter of economy manufacturers and agents should agree that the exhibit of each firm shall be confined to not more than one vehicle of each type." This seems the only reasonable conclusion that can be come to, seeing that the exhibition is not for a week or even a month, but for half the year. The exhibition will gain from the decision, for a very comprehensive show of vehicles should be made in which variety of designs will be the characteristic feature rather than the monotony that would be felt by the amusement-seeking public if they were only shown long rows of cars all very much alike.

A Carnival Week.

THE committee has also resolved that no vehicle shall be removed during the course of the exhibition unless another vehicle is there to replace it. But any exhibitor may temporarily remove a vehicle for road trials with customers. This, of course, may appear somewhat arbitrary to the exhibition authorities, but if they will realise the position of the industry and the value that will accrue to its development by allowing vehicles to be thus taken from the exhibition for a few hours now and again, there should be no difficulty in granting that small concession. Certainly it will not detract from the interest in the display, and even if that were so the suggestion made by the committee for an Automobile Carnival week should amply compensate. The exhibition council will be asked to arrange one special week, say in August, during which there shall be a carnival, demonstrations, races, etc., with possibly a tour from London to Glasgow in connection with the event. That should prove a really valuable suggestion and if the proposal is accepted the exhibition would benefit financially, while a great impetus should be given to automobilism in Scotland.

A Transport Service.

It is announced from Bordeaux that the Société des Diligences, Courriers et Messageries Automobiles has recently promoted a new company under the title of La Société Bordelaise de Transports Automobiles, for the purpose of establishing a rapid and efficient service for the transport of merchandise between the towns of Bordeaux and Mazarnet. It is proposed to employ five self-propelled lighters and an equal number of

automobiles, the plan of operations being as follows:—The lighters will receive at Bordeaux cargoes of rough sheep skins, which are regularly delivered at the port by American and Australian vessels, and so laden will pass up the Garonne, the lateral canal, and the canal of Midi to the Pont-Rouge, a total distance of 357 kilomètres, or 223 miles. At that point they will transfer their cargoes to the automobile drays waiting to receive them, and these latter will convey the skins to Mazarnet, a distance of 41 kilomètres (25½ miles). On the return journey the products of Mazarnet, such as wool, leather, etc., will be transported to Bordeaux for expulsion. This service, placing them as it does in direct communication with a seaport, should be of immense advantage to the manufacturers of Mazarnet, and in the case of its proving successful will certainly lead to the inauguration of similar transport services in other parts of France. The result of the experiment will be awaited with very considerable interest.

The Speed of Motor-Cars.

IN our correspondence column there appears a letter from Mr. T. S. Gowland, of Eastbourne, on the subject of the speed of motor-cars, occasioned apparently by the wonderful achievements of the competitors in the recent Circuit du Sud-Ouest race, chronicled in our last issue. Our correspondent would seem to have overlooked the fact that the high speed referred to was indulged in, not on English highways, but on the roads in France, where road-races are not only permitted, but are even encouraged by local authorities. He would also appear to be under the impression that we are advocates of these high speeds. That such is not the case need hardly be said—a glance over the pages of our last volume will prove that we have no sympathy with road scorers, whose performances do more harm than good to the automobile movement.

Motorists on the Defensive.

THE inevitable has happened, and the isolated motorists who have hitherto encountered rebuffs all alone in country police-courts will shortly be organised in their mutual self-defence. Given a motorist, a policeman, and a member of the Great Unpaid, and it will easily be realised that the first-named will be contradicted by the second, and convicted by the third. A policeman who rarely meets anything but cows, sheep, hay-carts, and thrashing machines in his country walks is naturally inclined to exaggerate the speed of the more progressive automobile, and when his evidence is told to a very horsified bench the motorist appears a very terrible person. Hitherto there has been no helpfulness among the devotees of the motor-car, and each has had to fight his battle single-handed. In cases like that of the Hon. C. S. Rolls and his drive on an electric car, expert evidence has completely shattered the sworn oaths of police constables, and if motor-car cases were generally conducted on such lines very different results would be recorded.

The New Association.

WE are led to these reflections because of the formation of the Motor Vehicle Users' Defence Association, which has been established for the assistance of automobilists, and for their protection against civil and criminal actions arising from accidents, etc., in which motor-cars are concerned, alleged furious driving, and the dozen or more prosecutions for various offences, or imagined offences, for which motor-carists are liable. The need of such an organisation is undenied, and the mere fact that it has been instituted should have a good effect in steadying the enthusiasm with which the police authorities are inclined, in some places, to pursue a campaign against automobilists. As will be seen from the report on another page a very representative committee of management has been formed, which will have a wide discretionary power to defend or commence individual cases, the effect of which action may be beneficial to motorists in general. We are glad to know that already several provincial motorists have joined the associa-

tion, and that the support of most of the metropolitan users is assured. Therefore we have every confidence in advising our readers to become associated with this well-directed effort to secure automobilists from wanton annoyance and irritating convictions. This advice should be particularly emphasized in the case of motorists in country districts who, by means of this association, will be placed in touch with the best legal advice, as well as with the practical knowledge that will be comprehended within the membership.

"Automobility."

IN a paragraph calling attention to the Automobile Club the *Daily Chronicle*, after referring to the fact that the membership includes Sir Richard Webster, Sir William Preece, Sir David Salomons, Professor Vernon Boys, and Major Holden, goes on to say, "But the expense of the material will for some time prevent automobilism—or should it be automobility?—from becoming a really popular amusement." Our contemporary has evidently got hold of the idea that motoring is simply a pastime, and that its main service will be in the direction of amusement. In France that has been its primary use, but the solidness of the

SNAPSHOT OF AMÉDÉE-BOLLÉE CAR NEAR PARIS.

English character has prevented that phase of "automobility" from developing before the commercial use of motor-vehicles has been established. Ere long the newspaper press will realise that even the expense will not prevent the development of motor-car services throughout the country, while the adoption of steam-propelled vehicles for heavy traffic is nearer than the *Chronicle* imagines.

A Suggested Tax on Motor-Cars.

A MEMORIAL from the Northwich Rural District Council in favour of taxing cycles and motor-cars was the cause of a very lively meeting of the members of the Altrincham Urban District Council on Tuesday last. The question of the clerk as to whether he should read the memorial was answered by numerous cries of "Yes," "No," "Rubbish!" and finally the chairman decided that it should not be read. This was the signal for a further outburst. Mr. Gatley moved a resolution in favour of adopting the memorial. Cycles were, in his opinion, a source of danger to the public, and motor-cars were an "infernal nuisance." When driving out he had had his horse driven right across the footpath against the hedge by them. Finally, however, Mr. J. Smith moved that the memorial be not entertained, and said that the suggested tax would be a great mistake. This having been seconded, three members voted for the resolution, and the amendment was carried by a large majority.

THE Kidder Motor-Vehicle Company has been formed at Dover, Del., with a capital of £100,000, to deal in motors and motor-vehicles.

THE MOTOR-VEHICLE USERS' DEFENCE ASSOCIATION.

AT the Automobile Club, Whitehall Court, S.W., a well-attended meeting of this association was held on Tuesday, under the chairmanship of Mr. Roger Wallace, Q.C., the president of the club. There was a representative attendance of private users and manufacturers and agents; Mr. T. W. Staplee Firth and Mr. G. R. Helmore, the solicitor and secretary respectively, were also present.

The Chairman said it was well known that owners of cars were subject to severe handling in the police courts, and it was generally agreed that some kind of defence association was necessary in order to protect the common interests. The association which had been formed was to have a committee, which would consist of the chairman and vice-chairman of the Automobile Club, ten other gentlemen, and three trustees. Captain the Hon. Cecil Duncombe, the Hon. J. Scott Montagu, M.P., and Sir David Salomons, Bart., had consented to act as trustees, and the Automobile Club had elected five members of the committee, Sir E. Jenkinson, Major H. C. L. Holden, Mr. E. R. Shipton, Mr. R. E. Phillips, and the secretary of the club, Mr. C. Johnson. Five other members of the committee, who need not necessarily be members of the club, had to be elected. Mr. Firth, who had acted very successfully in several cases, had consented to act as solicitor. Users of motor-vehicles would be welcomed as members, and donations would also be welcomed. He mentioned that the Hon. Evelyn Ellis had sent a donation of twenty guineas.

The election of the five other gentlemen to form the committee was then proceeded with, the voting being by ballot, and disclosing the fact that the Hon. C. S. Rolls, Messrs S. F. Edge, Charles Cordingley, J. Mann, and F. Wellington had secured election.

A discussion then took place with regard to the subscriptions of members owning more than one car, and of manufacturers and agents.

Sir David Salomons pointed out the various classes which would come into membership, and that those who had several cars, and only one driver really had several risks. In connection with patent questions, if a private owner had several cars the liability of the association would be greater: therefore he thought the number of cars owned by the member should be considered in settling his subscription. But in the case of the trade it was more the number of drivers than of cars that should decide the matter.

Mr. Mann suggested that, instead of taxing cars the association should tax drivers, and that manufacturers should pay upon the same basis, paying for all their drivers.

Mr. Friswell asked what the association was going to do for manufacturers, and suggested that they should pay, say, £1 and 10s. for every driver up to £5.

Sir David Salomons said the association was not going to pay all legal expenses, but the usefulness of the committee would be dependent on the amount of subscriptions and donations.

The Chairman thought the association could be extremely useful in getting evidence, and a good deal of voluntary work would have to be done.

Mr. C. Johnson gave an instance of the useful work which might be done by such an organisation. Last year a motorist living in Kent was summoned for alleged furious driving on the highway. He could not take up the case himself, and so the Automobile Club assisted him in his defence. They were able to prove the horses he was alleged to have frightened were not on the highway, and that his car was only going at nine miles an hour, with the result that he won the case.

Mr. Staplee Firth said the association would be wholly one for mutual protection, and was based upon the principle of self-help.

Mr. R. E. Phillips was surprised to hear it suggested that the association should take up patent questions. If manufacturers infringed patents they should take the responsibility.

Mr. Firth explained that the reference to patents did not mean fighting between patentee and infringer, but if the owner of a patent sought to interfere with the user of a car, and the committee thought it was a case of blackmailing, they might be able to help.

A question was raised as to what action would be taken in regard to Corporation Bills which adversely affected motorists, the chairman replying that in such cases the Automobile Club would continue to act as heretofore.

Ultimately, on the motion of Mr. Mann, seconded by Mr. Friswell, it was resolved that the annual subscription should be £1 for members who do not own but who may drive a motor-vehicle; and £1 for members owning a motor-vehicle or motor-vehicles, but if a member employs a driver or drivers he or they must be registered and a subscription paid by the owner of the car or cars in respect of the said driver or drivers.

The proceedings then terminated, a meeting of the newly elected committee being subsequently held. Intending members will be interested to learn that the office of the new association is at 84, Chancery Lane, E.C.

ACCUMULATORS FOR IGNITION PURPOSES.

THE Georges Richard Company, the well-known manufacturers of motor-carriages in Paris, according to a French contemporary, give the preference to storage batteries for the ignition of their motors. The batteries, however, should have low resistance and be frequently recharged from a low current. M. Richard estimates an average of sixty miles a day for an automobile, or five hours' work for the motor. The contact producing the spark lasts only about one-fifth of the revolution of the cam which causes it, so that about two ampère-hours would be required for each day of work, nineteen hours out of the twenty-four the battery being at rest. Hence, a charge of continuous current of one-tenth ampère will be sufficient to restore the battery after each day's work, just the amount which a good dry cell will yield without danger of polarisation and with the assurance of a life of 200 to 300 ampère-hours. Hence, a good battery of dry cells ought to keep the storage battery fully charged for a period of five or six months, connection being made immediately after returning to the stable. The voltage can thus be automatically regulated. The voltage of the dry battery being equal to that of the storage battery when fully charged, if on return the storage battery voltage is inferior to that of the dry cells, the latter send current into the storage cells. When the voltage is restored the dry cells cease discharging and tend to depolarise. Hence, the storage cells work continually under the most favourable conditions, receiving and discharging in small quantities.

IDEN'S PATENTS, LIMITED, is the title of a company which has been registered with a capital of £10,000 to manufacture, let on hire, and deal in motors, cycles, and vehicles, and to carry on the business of electricians, engineers, smiths, &c.

THE Winton Motor Carriage Company, of Cleveland, U.S.A., have lately despatched one of their automobiles to the City of Mexico. The output of the Winton factory for the year past is stated to have amounted to nearly two hundred vehicles of the delivery wagon and phaeton types.

A MEETING of directors of the Lincoln Motor-Bus and Parcel Delivery Co., Ltd., was held last week, when the preliminary work necessary for the flotation of the company was proceeded with. The secretary reported that further satisfactory applications for shares continued to be received, whilst inquiries and promises of active support were of daily occurrence. Negotiations for the purchase of the first cars are far advanced. A deputation of directors had recently inspected the systems and vehicles in use in other towns, and thus obtained useful information for their guidance in the management of this company, which has a capital of £5,000.

The Late Herr Gottlieb Daimler.

ALL interested in the progress of automobilism will learn with deep regret of the death of Herr Gottlieb Wilhelm Daimler, which sad event occurred on Tuesday at his home at Cannstatt. For some time he had been in ill health, and although he was approaching the threescore year and ten, when activity frequently ceases, news of his death will be mournfully received by those who have long recognised his genius, and admired the steadiness of work which always characterised the deceased gentleman. In business life he won the esteem of all who had dealings with him, while in private concerns he was ever a faithful friend and sympathetic counsellor.

He was born at Schorndorf, in Germany, in 1834, and very early showed remarkable aptitude in mechanical matters. When he left school he served an apprenticeship in an engineering works, and worked in many of the principal factories in Germany. Then he spent a few years in England, where, at the Whitworth Works, he added to his practical and sound knowledge of construction.

After visiting several foreign countries he joined Dr. Otto in an attempt to develop the gas engine, and in 1872 they, with the help of Herr Langen, a councillor of Cologne, established the Gas-Motoren Fabrik at Deutz, Herr Daimler being the manager. He initiated Messrs. Cross-

ley Brothers, of Manchester, into the principles of gas engine construction on the Otto plan, and in 1882 relinquished his direction of the works at Deutz in order to devote all his time and thought to the introduction of a light and high-speed petroleum motor. The results of his efforts were subsequently seen in the now well-known Daimler motor.

In 1886 he succeeded in applying his motor to a bicycle for the first time with success, and, in the following year, he adapted it to a vehicle with eminent satisfaction, not only to himself but to other experts. Of course, he did not rest content with that, but has since introduced many improvements, with the result

that the Daimler motor has been adopted by many of the principal motor-car constructors in France, England, and other countries. In fact, the demand of late has been so great that Messrs. Panhard and Levassor, who enjoy the sole French rights of Daimler's patent, have been compelled to withhold any supplies to other firms, retaining the privilege of using the Daimler motor only on their own cars.

It has often been thought that the "Phénix" motor, which

is slightly different to the original Daimler motor, was the invention of and was introduced by the late M. Levassor, but Herr Daimler proved some time ago that such impression is erroneous, he himself having originated the improved form.

Five years ago the deceased gentleman left the Daimler Motoren Gesellschaft, and formed a new company to work the new invention which he had patented—viz., the "Phénix" motor just referred to. This proved so successful in superseding the earlier invention that after a short time the older concern saw the wisdom of amalgamating with the newer company.

THE LATE HERR GOTTLIEB DAIMLER.

THE *Horseless Age* states that Mr. E. H. Lyon, of Englewood, N. J., has devised an automatic electric lighter for the boiler of his Locomobile steam-car. It consists of two dry cells and a 6-in. coil, the latter fastened on the inside of the car-

riage body and the former carried in the tool box, a magnet and a vibrator. The stem of the igniter stands permanently in one of the air holes of the burner, and is supported on a bracket screwed to the woodwork underneath. The device is operated from the seat by pressing a button and turning on the fuel, when the buzz of the vibrator will give notice if the effective spark has been obtained, thus avoiding waste of fuel. One great advantage of this automatic lighter is the ease with which the fire can be extinguished and relighted, preventing blowing off of the boiler and consequent frightening of horses. The device is being put on the market by Mr. A. L. Bogart, 123, Liberty Street, New York.

THE "EOLE" VOITURETTE.

ONE of the new motor-voiturettes shown at the recent cycle and motor exhibition in Paris was the "Eole," manufactured by Messrs. J. B. Clement and Company, of the Palais des Chauffeurs, 120, Boulevard de Courcelles, Paris, and of which a general view is given herewith. The motor is a $2\frac{1}{4}$ -h.p. Aster, and, as will be seen, it is located in the front of the car where the air is free to circulate around the radiating fins of the cylinder. On the end of the motor shaft, towards the axis of the car, is a sprocket wheel, a chain transmitting the power to an intermediary shaft fixed about the centre of the frame. The latter also carries a second sprocket wheel, loosely mounted on the shaft. The sprocket is, however, of a special form and practically forms the female portion of a clutch, the male part being fast with the shaft, the clutch being controlled by a foot-pedal. From the intermediary shaft to the rear axle the power is transmitted by a centrally-located chain, the sprocket on the axle being formed around the differential gear. The motor is started by means of a detachable handle, it being impossible for the car to move until the clutch gear is thrown in. The frame of the car is of tubular construction, while the body, which is adapted for two persons, is spring suspended. Steering is controlled by a sloping

hand wheel, while the road wheels are of the cycle type with pneumatic tires. The car, which weighs about 4 cwt., can, it is claimed, attain a speed of thirty kilometres per hour. The same firm are also building a car on similar lines, but fitted with two Aster motors giving together $4\frac{1}{2}$ -h.p., they claiming to have overcome the difficulty of getting the two engines to work synchronously. The double-motor car will, it is said, attain a speed of forty-five kilometres per hour. The "Eole" car is interesting as showing the trend of the demand in France—the cost of the single engine car in that country is only 2,500 fr. (£100).

ONE of the latest accessions to the ranks of society automobilists is Viscount Villiers, who has lately purchased a Deauville voiturette from the Motor-Car Company, Limited.

THE prize of £10, offered by Mr. H. Edmunds, a member of the Automobile Club, for the best essay on speed, has been awarded in accordance with the recommendation of the judges to Mr. Sidney Russell.

THE Star Motor Company, of Wolverhampton, have sent us a copy of their new catalogue of "Star" motor-cars. In its latest form this vehicle has quite an attractive appearance, illustrations being given of three designs of "body." As the details of the "Star" cars are now fairly well known, it need only be mentioned that they are all of British manufacture, and that an improved form of carburettor is now being fitted. Six pages of the list are devoted to very clear illustrations of the various parts of the car, such as the motor, petrol and water tanks, axles, wheels, etc.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

At Dieppe.

ON Saturday last at Dieppe, under the presidency of the mayor, M. Coche, there was held a meeting for the purpose of appointing an organising committee for the international automobile race, which it is proposed to hold during the month of June. After considerable discussion the following gentlemen were appointed to the committee. Presidents of honour, M. Coche, Mayor of Dieppe, and Mr. Lee Jortin, British vice-consul; president Comte de Sainte-Marie; vice-presidents, MM. De Meur and Thomas Yeo; secretary, M. Bénoni Ropert; assistant secretaries, MM. Legendre and Samuel Hall; treasurer, M. Dufayel; committee, MM. Bloch, Wallis, Lebesque, Meyer, Ducouect, and Brau. Immediate steps will be taken to push forward the work, and it is hoped to make public the details of the proposed course at an early date.

A Correction.

I NOTICE that by the addition of an "R" the sense of paragraph 12 in the list of advantages of electrical vehicles, as enumerated by Monsieur Ernest Cuénod, is somewhat distorted. A glance at the paragraph in question, which appeared on page 780 of this journal, would lead one to suppose that the "horse" bars the streets of Paris during half the day, and the reader is left to surmise as to how the noble animal spends the remainder of his time. It is not, however, the horse, but the "hose" that is to blame for the encumbrance of the streets to which M. Cuénod refers in this particular instance, and in order that no unjust stigma shall rest upon the character of the fiery steed of Paris, I hasten to correct the error.

The Spa Meeting.

AS I have already announced in these columns, the Spa Automobile Meet will take place during the last week of August, and although this is a long way ahead the official programme has already been definitely settled. Proceedings will open on Saturday, August 25th, with a "caravane" race from Brussels to Spa, while the following day, Sunday, will witness the big *course*, Spa-Fraiture-Spa. On the Monday, August 27th, a race for voiturettes will be decided over the same route. The opening of the automobile exhibition will take place on Tuesday, August 28th, and the following day will be devoted to the formal distribution of prizes to the various successful competitors. At night a banquet will be given to those automobilists who have assisted at the *réunion*. The prize fund will amount to at least £800, which should induce many racing men to participate in the events of the Spa week.

Motor-Cars and Reverse Gears.

MONSIEUR PIERRE BAUDIN, the French Minister of Public Works, has recently addressed a circular letter to the *préfets*, which sets at rest the fears of many *chauffeurs* relative to their cars, and which further demonstrates the desire of those in authority not to throw obstacles in the way of the new industry. As is doubtless well known, every automobile vehicle in France, which exceeds 250 kilos. in weight, is required by the law of March 10th, 1899, to be fitted with a *marche arrière*, or backward gear, and this ruling has caused much uneasiness of mind to those automobilists who possess cars built previous to the issue of this decree and not so provided. In some cases the addition of the gear presented no difficulties, and the work was carried out, but, generally speaking, owners chanced the possibility of penalties, and continued to drive their cars minus the stipulated addition. Monsieur Baudin's letter authorises the *préfets* to permit of the circulation of cars exceeding 250 kilos. in weight, and unprovided with reverse gear, upon condition that

the owners of the vehicles afford the administration proof that their cars were constructed previous to the decree of March 10th, 1899, coming into force. Monsieur Baudin further expresses the opinion that it would be an excess of rigour to insist upon these vehicles being changed to comply with the prevailing law, entailing as it would do in many instances, heavy expense to the owners.

The New Clubs.

ONE of the more recently-formed automobile clubs, namely Le Moto Club de Roubaix, has announced the intention of organising an automobile *course* between Roubaix and Béthune, a distance of about 100 kilomètres, or 62½ miles. This race will be decided on one of the Sundays of the present month, and only members of the promoting club will be eligible to compete. The Automobile Club of Nantes, another fledgling society, is contemplating the organisation of its maiden race, and this too on somewhat ambitious lines, for Nantes—Paris is talked of, and categories for both cars and motor-cycles. Two well-known local enthusiasts in the persons of MM. Saufriquet and Lefèvre-Utile are the mainstays of the Nantes club, which has only been in existence a week or two. That these initial efforts of the two clubs may be crowned with success will be the wish of every *chauffeur*.

Central Europe.

As is generally known the leading automobile clubs of Central Europe some time ago appointed a general committee. This committee is now busily engaged in organising a competition for electric motors, which it intends to bring off at Berlin, either in May or June next. The general programme of this "concours" has not yet been made public, but it is believed that the trials will be carried out on a very extensive scale. Another event exciting considerable interest in Central Europe is the Vienna Automobile Exhibition, which will open during the month of May. The Count Max Egon Furstenburg is president of this exhibition, and the Duke Jean Wilezek and the Chevalier de Schœller vice-presidents. Automobilmism is making such rapid progress in Austria that the show is sure to be one of exceptional interest, and will draw great numbers of enthusiasts to Vienna.

In Belgium.

THE Liège Salon du Cycle et de l'Automobile will not be held this year as manufacturers showed no disposition to participate, and the organisers were therefore compelled to abandon the scheme. It is all very well to endeavour to popularise automobilism, but one can have too many exhibitions, and then the shows result in nothing for the exhibitors except a very heavy bill of expenses. A practical demonstration is in course of organisation by the Automobile Club of Belgium. It will take place on Sunday, April 29th, and will afford plenty of amusement and instruction. An obstacle race, a *concours d'élégance*, a floral fête, and a gymkhana will be among the numbers of the programme, which will also include a new item in the shape of a series of combined movements, executed by a dozen cars driven by members of the Automobile Club of Belgium, of a patronised club, or of a recognised foreign association. The Salon du Cycle have subscribed £20 towards the prize fund for these competitions, and the Automobile Club of Flanders has announced its intention of presenting a handsome gold medal as award for one of the trials.

The Paris-Bordeaux Race.

La France Automobile announces that entries for the Paris-Bordeaux race have been received from America from Messrs. Pennington, Jarrott, and Wridgway, who will drive vehicles fitted with motors of 20 h.p. The cars will, it is stated, only weigh 11½ cwt., which our contemporary considers is altogether too light.

The De Dietrich Petrol Motor-Wagon.

MESSRS. DE DIETRICH AND Co., of Luneville, the makers of automobiles on the Amedée-Bollée system, are now turning out motor-wagons capable of carrying loads up to from 2½ to 3 tons, one type of which is illustrated herewith. The frame is built up of channel steel sections, the motor, a 10 b.h.p. two-cylinder one, with tube-ignition and water-jacket, being located in front. Three speeds forward—4, 8, and 14 kilomètres per hour—are provided, as also a reverse motion of 4 kilomètres per hour. From the motor the power is transmitted by a single belt to a counter-shaft at the rear; this is geared by spur-wheels forming the variable speed gear—to a parallel intermediary shaft, while this is connected direct by short longitudinal shafts and bevel gearing to large bevel wheels bolted to the rear road wheels. The driver is, as will be seen, provided with a covered seat, and has all the control levers grouped near the steering wheel. The petrol tank has a capacity sufficient for a run of 150 kilomètres, while 30 litres of water are carried, this

being said to be enough for a day's run, two radiating coils being provided. Special attention has been paid to road wheels, which are of the artillery type with iron tires. The front wheels are 36in. diameter, and the rear 39in. The platform measures 5ft. 2in. by 8ft. 2in., while the overall dimensions of the vehicle are 6ft. by 11ft. 9in. With a load of 2½ tons the wagon will, it is claimed, attain a speed of 14 kilomètres (nearly nine miles) per hour, and ascend gradients on the low gear of 1 in 8, while in districts where the gradients do not exceed 1 in 20, three ton loads may be carried. The weight of the wagon, with petrol and water ready for a day's work, is given as about 1 ton 15½ cwt.

La Coupe des Voiturettes.

It is on Sunday next that the race known as "Le Coupe des Voiturettes," and organised by *La Journal des Sports*, will be decided over a route from Saint-Germain to Rouen and back. As the very greatest activity exists among constructors of small cars, who are all anxious to place their productions prominently before the public at the very outset of the season, very considerable interest is being taken in the event, and should the fine weather continue a big crowd will surely assemble to see the start and finish of the race. Comprised in the list of entries, which closed on Wednesday evening, I notice the following names:—1. Voiturettes fitted with water-cooled motors: (a) cars weighing less than 250 kilos., Hertel, Camus, Sauvage and Echalié; (b) cars weighing less than 500 kilos., Stepho, Hugot, Pullinger, three Decauvilles, Delautre, Klauss and Vehel, 2. Voiturettes fitted with air-cooled motors: (c) cars weighing less than 250 kilos., Schrader, Thierry, Velain, Jacquelin, Domptet and Tart; (d) cars weighing less than 500 kilos., Van Berendonck, Fernandez, Gaillat, D'Arnaud, Lepape and Laurent.

The A.C.F. "Garage."

THE *garage* of the Automobile Club de France is now open, and members are already commencing to avail themselves of the splendid building for the storage of their automobiles. Great as is the available space its capacities will be taxed to their utmost in a month or two's time, when *chauffeurs* will be concentrating in Paris, and the *garage* superintendent and his assistants will be fully occupied in looking after the infinite variety of automobile types which will be placed under their charge. The tariff is distinctly moderate, as will be seen from the appended table:—

Class of Vehicle.		Per Year.	Per Month.	Per Night.	Per Unit.
Petrol and Electric Cars	Storage ...	300	30	2	—
	Cleaning...	350	40	—	3
	Total ...	650 fr.	70 fr.	2 fr.	3 fr.
Voiturettes and Voiturelles	Storage ...	250	25	1.50	—
	Cleaning...	300	30	—	2.50
	Total ...	550 fr.	55 fr.	1 fr. 50 c.	2 fr. 50 c.
Motor Bicycles and Tricycles	Storage ...	150	15	1.50	—
	Cleaning...	200	25	—	2
	Total ...	350 fr.	40 fr.	1 fr. 50 c.	2 fr.
Bicycles	Storage and Cleaning.	100 fr.	10 fr.		

The adjuster-engineer's time in effecting repairs will be charged for at the rate of 1s. 3d. per hour, that of the assistant engineers at 10d. per hour. The *garage* will open at 6 a.m. during the summer months, and at 8 a.m. in the winter. All automobiles deposited should be insured by the owners. Electric vehicles can be recharged and all light repairs carried out. The whole scheme has been capitally arranged, and reflects the very greatest credit on the club committee.

A Savage.

On the afternoon of the 1st instant, in the Avenue de l'Isle at Vitry, there took place an unfortunate accident, which, by reason of the heartless and utterly incomprehensible conduct of a *chauffeur*, has aroused considerable feeling in the neighbourhood against automobilists in general and this one in particular. From the accounts to hand it appears that a labourer named Charles Neuve-Eglise, aged thirty-one, and living in the village of Vitry, was riding to Choisy-le-Roi on his bicycle, when from some cause or other he fell heavily to the ground. The violence of his fall was such that he fainted, and at the same moment an automobile travelling at a high rate of speed and in the same direction as the unfortunate man had been pedalling, passed over his body. For this the *chauffeur* may or he may not have been to blame, but it was his subsequent conduct that has excited so much local indignation. One would have thought that the slightest sense of humanity or the smallest spark of pity would have prompted him to have immediately stopped and rendered every service in his power. But apparently this individual was devoid of all human feeling, for he employed his best endeavours to get clear of the scene of the accident, and quickly disappeared down the road. Transported by the passers-by to the residence of Dr. Aubry it was quickly ascertained that the unfortunate victim's injuries were of a very serious nature, and he was removed as speedily as possible to the Bicêtre hospital. A broken thigh, three fractured ribs, and internal injuries render his con-

dition one of great gravity. As for the automobilist who caused the mishap—well, the police are looking out for him, and the sooner that he is brought to book the better. It seems almost incredible that such savages actually exist, and it is to be sincerely hoped that this one reaps the reward of his callousness.

Average Speeds.

THE record performance achieved by M. René de Knyff in the recent big race known as the "Circuit du Sud-Ouest" has again drawn attention to the average speeds made by the winners of last year's courses, and as many of these events will be repeated this season, I propose to quote some of the average speeds recorded, in order to enable comparisons to be drawn. As I stated last week, M. de Knyff's time for this course of 335 kilomètres, or 209½ miles, was 4h. 46min. 57sec., or at an average speed of 70 kilomètres (43½ miles) per hour. The nearest approach to this achievement is that of M. Levegh, who, on Sunday, October 1st, 1899, covered the 281 kilomètres (175½ miles) of the Bordeaux-Biarritz race in 4h. 24min., representing an average of 63 kilomètres 863 mètres (40 miles) per hour. M. Levegh's actual net time, deducting 15min. lost in repairing a punctured tyre, brings the average speed made out at 67 kilomètres (42 miles) per hour. Another of the fastest performances recorded, but made over a much shorter route, was M. Antony's win in the Paris-Trouville race of August 27th. Here the distance was but 175 kilomètres (109½ miles), and the winner's average speed 58 kilomètres (36¼ miles) per hour. M. Girardot's 12 h.p. Panhard finished first in the Paris-Boulogne race of September 17th, covering the 230 kilomètres (141½ miles) in 4h. 17min. 44sec., equalling an average speed of 54 kilomètres, or 33½ miles per hour. M. René de Knyff's time of 42h. 33min. 39½sec. for the 2,175 kilomètres (1,359½ miles), which constituted the distance covered by the competitors in "Le Tour de France," gave him an average speed of 51 kilomètres 100 mètres (32 miles) per hour. The Paris-Saint-Malo race of July 30th was 372 kilomètres (207½ miles) in length, and M. Antony covered the distance in 7h. 32min., giving an average speed of 50 kilomètres, or 31¼ miles per hour. The dead-heaters, MM. Levegh and Girardot, took 6h. 11min. to accomplish the 332 kilomètres (207½ miles) of route between Paris and Ostend, representing an average of 52 kilomètres (32½ miles) per hour. Paris-Bordeaux, the automobile "Derby" was won by M. Charron in 11h. 43min. 20sec., or at an average speed of 48 kilomètres 200 mètres (30 miles) per hour for the route of 565 kilomètres (353 miles). M. Albert Lemaître's time for the 120 kilomètres (75 miles) of hilly route over which the Nice-Castellane-Nice race was decided on March 21st was 2h. 52min. 50sec., giving an average speed of 41 kilomètres 990 mètres (26¼ miles) per hour.

A GLASGOW evening paper gravely explains to its readers—men and women alike—that "the so-called 'motor' hats are wide toques of velvet or cloth, copied from the styles affected by French lady motor-carriage drivers."

A MOTOR-CYCLE race meeting will be organised by the Automobile Club to take place at the Crystal Palace track on the afternoon of Saturday, 30th June. Further particulars will be published later. Official test of the speeds of motor-tricycles on the track will be carried out on the same day.

SOME weeks ago we mentioned that Mr. Robert E. Phillips, in conjunction with one or two other members of the Automobile Club, was endeavouring to find stabling accommodation for motor-cars in the west district of London. Mr. Phillips now writes to say that he has found what he requires, and that all the available space is taken up.

MR. LISLE, of the Star Motor Company, Limited, Wolverhampton, informed me, writes our Midland correspondent, that a gentleman bought a new "Star" car on Monday last and drove it straight away to his destination at Haywards Heath—a distance of about 170 miles. He reached there late on Tuesday evening having only made one stop—at Oxford—and reported that the car went right through the journey without the slightest mishap.

THE AUTOMOBILE IN LOCAL TRANSIT.

By SYLVESTER BAXTER.

ONE of the most vital problems relating to the modern municipality is that relating to local transit. The development of the automobile bears upon this question in two important ways. One of these replaces an existing form of animal-traction service and the other supplements a highly developed form of mechanical traction. Each has the advantage of a greater flexibility in operation than the corresponding methods in existence. The first, a motor-cab service, is already in a well-advanced stage in several American cities. This may be called the individual aspect of automobile local transit, giving to a person at a moderate charge all the advantage of a privately owned carriage; taking the passenger, as it does, from his own door to any spot that he may desire to reach. No investment is required on the part of the individual; the vehicle company assumes all the care, repairing, cost of charging, etc.; and with a telephone in his house or office a person may bring to his door at any moment what practically amounts to his own carriage. While, of course, there is a manifest economy in the possession of one's own automobile when it is wanted for regular use every day, for a very large number of persons — particularly those who live in cities — the hired vehicle will prove highly economical, and we may expect to see an enormous increase in the use of the motor-carriage for individual business and recreative purposes, such as errands to sections of a city not reached by the ordinary transit routes, pleasure drives in the parks and suburbs, etc. The celerity of the motor-vehicle, its easy motion, its tirelessness, the free view on all sides, make it an ideal form of recreative conveyance, and with its growing availability we may expect to see a very great increase in the number of those who patronise livery carriages. An economic aspect of this form of service lies in the fact that the capacity of the plant is so much in excess of an aggregation of a corresponding number of privately-owned carriages, each one of which is used, as a rule, only by the person or the family possessing it. But when a company owns the same number of vehicles for hire, they are naturally in use by a very much larger number of persons, and consequently make a much greater return on the investment in the way of utility, which in the matter of the commercial company is equivalent to profit. This suggests the desirability of what may be called a modified form of private ownership in the shape of collective ownership on the part of groups of individuals. For instance, a number of persons might act co-operatively by clubbing together and purchasing any desired number of motor-vehicles to be kept for their common use as required. In this way there would be a material economy in expenses for stabling, care, charging of batteries, experienced drivers, etc., while a greater variety of vehicles would be at the disposal of the individual. Such a function might be assumed by automobile clubs to the advantage and convenience of their members, and we may expect to see a great growth of clubs for this very purpose, with membership as large or as small as may seem desirable. It is a common custom for boat and canoe clubs

to own various kinds of water-craft for the use of their members, and there is no good reason why an automobile club should not follow the example.

The public aspect of automobile local transit is represented by the motor-omnibus service, now in successful operation in various towns and districts. The possibilities of automobile omnibus lines is something enormous, and there is probably no more promising field for the profitable application of the principle than is offered in this. While it cannot be expected that this form of traction will to any degree supplant the tramway method, in all probability the motor-omnibus will rival the latter to a considerable extent, as it certainly will supplement the latter most conveniently. Moreover, it can easily be made a most valuable auxiliary to a tramway service. A tramway system, of course, has the advantage of larger vehicles than are practicable for motor-omnibuses, as well as that of a higher rate of speed. For in the former the element of guidance, so far as steering is concerned, does not appear, and the matter of control being therefore limited to fewer particulars, a higher speed in city streets is practicable, as a rule, than where the matter of direction enters very largely into consideration. But these advantages are counterbalanced by certain factors that tell in favour of the

motor-omnibus. The latter has a much greater flexibility than the tramway system possesses. If a tramcar breaks down it brings to a stand every car behind it until the way is cleared. The same interruption occurs in the case of a blockade of the street for any reason—from the collapse of a heavily-loaded team—and loaded teams seem invariably to have the perversity to choose the tramcar tracks as the scene of misfortune—to the congestional effects of processions, circus parades and gas-main explosions. But the breaking down of a motor-omnibus can have no effect on the other vehicles of the line, and in case of the

THE NEW FOUR-SEATED 8-H.P. DECAUVILLE CAR. (For description see next page.)

blockade of any portion of the route the traffic can at once be diverted around through other streets for the time being. The motor-omnibus can also take the fullest advantage of improved forms of pavement. An asphalt pavement, for instance, converts the entire street-surface into what for the motor-vehicle is practically one broad rail of indefinite width—or what is the equivalent of a rail in every property except that of guidance. It can skilfully thread its way through the tangle of a crowded thoroughfare where the tramcar is constantly brought to a halt by this or that interruption. So, even in the matter of speed through the busy streets of a city, the motor-omnibus will be found to have the advantage over the tramcar. Another point in favour of the former is its great directness. A tramcar between two cardinal points—such, for instance, as terminal railway stations on opposite sides of a city—makes its route as devious as possible—going the longest way around so as to pick up the greatest number of passengers practicable. An omnibus line, however, having for its special object the conveyance of passengers between two such points, would take the shortest cut across and get its patrons to their destination in the quickest possible time. As to elements of profit—while a motor-omnibus cannot carry anywhere near the number of passengers that a tramcar can, and while a storage-battery system is much more costly in operation and maintenance than a trolley system, on the other hand the

motor-omnibus is entirely free from the very costly factor of construction, maintenance, and renewal of track—items that consume a very large proportion of the capital and the receipts of an entire tramway company. For the motor-omnibus line the traction surface is provided by the public. And when we consider what enormous profits a tramway would make were the element of rails, roadbed, trolley-wire, return-conduits, etc., eliminated, it may be imagined what a field for investment is offered in the establishment of motor-omnibus lines in cities.

It is safe to say that the prospective demand in this direction alone is sufficient to exceed enormously the capacity of all the existing manufacturing facilities in this country were they confined solely to that special feature, instead of being overrun with orders for motor-vehicles of every description.

There are three cities in North America where lines of automobile omnibuses will be in full operation before the end of the present year, and each of these present exceptionally favourable opportunities for the purpose. These are New York, Boston and Mexico. In the city of New York, Fifth Avenue, with its magnificent extent of asphalt pavement unbroken by car tracks, offers a superb opportunity for the profitable operation of such a line. And this has been taken advantage of by the purchase of the Fifth Avenue Stage Line—so long celebrated for its decrepit horses, the butt of the caricaturists—by interests connected with the great Electric Vehicle Company. This will be the pioneer electric omnibus line of the continent, and the change will mark the beginning of an important epoch in local transit matters for the United States.—Extract from article in the *Automobile Magazine*.

A NEW DECAUVILLE CAR.

TO the well-known two-seated voiturette La Société Decauville, of 13, Boulevard Malesherbes, Paris, have lately added a four-seated car, of which an illustration is given on page 9. The new car differs from the small one in that the motor is placed in the fore part of the frame under a bonnet instead of at the rear. The engine is a two-cylinder vertical one of 8 h.p., with electrical ignition and water jackets. Three speeds forward and one reverse are provided, the power of the motor being transmitted as usual through bevel gearing direct to the rear axle, no chains or belts being employed. Steering is controlled by a bar, while ample brake power is provided. The car, which weighs only about 8 cwt., can, it is claimed, attain a speed of from 35 to 40 kilometres per hour. We may add that the Motor Car Company, of Shaftesbury Avenue, London, W.C., are the agents for the Société Decauville's vehicles in this country.

Dr. O. P. Sook, of Newark, O., U.S.A., has recently purchased a steam carriage, which he is arranging to keep at the back of his house in a steam-heated structure. The gas jet will also be kept burning under the generator and the water kept hot, so that the vehicle will be ready for use at a moment's notice.

BROOKLINE, a town near Boston, U.S.A., noted for its fine residential streets and drives, has been a Mecca for automobilists ever since they began to be at all common in the neighbourhood, but now the local authorities have placed certain restrictions on horseless vehicles. The rules adopted are as follows:—(1) No automobile used either wholly or in part in the town of Brookline shall be run within the limits of said town at a rate of speed greater than ten miles an hour. (2) Every public automobile used either wholly or in part in the town of Brookline shall bear the number of its licence in a conspicuous place in the rear of the carriage in figures of Arabic characters, not less than 2 in. in height. (3) Every person in charge of an automobile waiting for passengers in any street, square, or public place in Brookline shall obey the directions of any police officer respecting the place of standing, and the route to be taken when going to or leaving such place. (4) The owners and persons having charge of an automobile used in violation of any of the foregoing regulations shall forfeit and pay for each offence a fine not exceeding 20 dols.

THE BUTIKOFER MOTOR-BICYCLE.

AN ingenious motor-bicycle, Figs. 1 and 2, is that which has lately been constructed by M. Ed. Butikofer, of Bienne, Switzerland. Whilst most makers of motor-bicycles have hitherto fixed the motor on to a tube of the frame, connecting it with the driving wheel by a chain or belt, M. Butikofer has conceived the idea of utilising the motor as the

FIG. 1.—GENERAL VIEW OF BUTIKOFER MOTOR-BICYCLE.

axle of the rear wheel of the machine, the engine being disposed horizontally through this wheel. This disposition permits, it is claimed, the obstruction in the frames to be considerably reduced, there being but the carburettor and the spirit and oil tanks to be carried on the frame. As regards the crosswise dis-

FIG. 2.—SECTION THROUGH REAR WHEEL.

position of the motor and its effect on the bicycle stability, M. Butikofer affirms that it gives rise to no inconvenience, but that, on the other hand, it reduces the amount of vibration transmitted to the rider.

As will be seen from the illustrations (Figs. 1 and 2), the single-cylinder motor is disposed crosswise through the back wheel, firmly held in position by the two extremities of the back forks

of the frame. In the cylinder, fitted with radiating discs *a*, works the piston *b*, which through the medium of the crank *c*, and the connecting rod, causes the fly-wheel *f* to rotate. On the axle *e* of the fly-wheel is keyed a bevel pinion *h*, which gears with a toothed wheel *g*, fixed to the case on which the spokes are fastened. The case *q* forms then the hub of the wheel, and rotates round the motor, it being carried on the ball-bearing *o p*. The case *q* is fitted at its extremity with a chain wheel *s*, on which the starting chain runs; it is also provided with four cams *m*, suitably disposed to actuate at the proper time the exhaust valve *k*, *i* being the automatic inlet valve. The ignition is effected by an electrical spark or incandescent tube as desired. As will be seen, all the working parts of the motor and transmission gear are grouped within a very small space, and are entirely enclosed in an oil-containing case.

CORRESPONDENCE.

LIGHT STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I was glad to learn from one of your recent issues that an English firm is building a light steam-car, somewhat on the lines of those that are now so largely used in America. I notice that the vehicle has been entered in the forthcoming 1,000-mile trial, and no doubt many of your readers like myself are looking forward to its appearance with interest.

From an American paper just to hand I note that one of the Locomobile Company's cars has recently been careering wildly about the streets of New York, it having, the newspaper states, been started by a boy after the owner had left it unattended to enter a building. While on the subject may I mention that any information from users of the Locomobile vehicles in this country as to the behaviour of the same in practice would be extremely valuable and interesting.

Richmond, S.W., March 5th, 1900.

Yours, etc.

STEAMER.

THE SPEED OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—If the makers and those interested in motor-cars wish to drive them off the roads entirely they will continue in the strain of the first comment in your issue of the 2nd inst. Surely anyone considering the matter for a moment must see that no such speed as 37½ miles an hour will be allowed on the public roads, and, though I am financially interested in motor-cars, I would never dream of allowing anything like such a speed; in fact, I should suggest that the authorities should amend the law and make it illegal to make cars capable of going at a greater speed than may be decided to be safe on the high road where vehicles and foot-passengers are passing.

Yours truly,

THOS. S. GOWLAND.

The Library, Eastbourne, March 7th, 1900.

THROUGH THE FLOODS FROM MANCHESTER TO LONDON ON A MARSHALL CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I venture to send you a short account of a trip I recently made from Manchester to London on a Marshall car.

I had intended starting for London on the Sunday made remarkable by the heaviest fall of snow we have had for years, but a look out of the window on the morning in question was sufficient to make me change my mind and to put off my journey. It was not until Saturday, a fortnight later, accompanied by three others, that I made a start from Manchester at noon. Anticipating some difficulty in obtaining petrol on the Sunday I took sufficient with me for the 200 miles, so that on starting with this and our personal belongings we were well loaded. The motor did not seem to feel the additional weight, going very steadily, and taking the hill out of Stockport easily on the second speed, and over the wretchedly-paved road at Hazel Grove on the first. On the last few yards of the hill leading into Macclesfield I used the

hill-climbing gear for the first time. From there (though now I think it would have been better to have gone through Leek) I went through Congleton, entering the town by way of Rood Hill, and by turning to the right up Antrobus Street obviated the necessity of passing through the narrow streets to the centre of the town.

We found the roads to Newcastle extremely heavy, and only reached there at three o'clock, putting up at the Castle Hotel, which we found possessed very good accommodation both for the car and ourselves. After having lunched and seen to the car we started again at 4.30, passing through Trentham, Stone, Rugeley, reaching the Peel Arms Hotel, Tamworth, at 8.30, without any incident worth mentioning.

The next morning (Sunday) we started off at 9.30 to do the remaining 118 miles to London. About half a mile out of the town the river had overflowed its banks for a considerable distance, coming right up to the side of the road, and in places washing over it. A few miles further on the water for a long stretch was up to our axles, making us think that if anything went wrong with the motor, it would be, to say the least, rather awkward. The roads were in places like seas of liquid mud and we were continually passing by large expanses of water where streams had overflowed their banks.

Our next stop was for lunch at the hotel on the top of the hill leading into Daventry. Shortly after re-starting we were surprised to find the car was "steaming"; this was more surprising as the car was fitted with radiator and pump, and up to Tamworth we had seen no steam and had not lost any appreciable quantity of water. On stopping to investigate we found that going through so much liquid mud had had a bad effect on the radiator, as it was one solid mass of baked earth, which took nearly an hour to knock off. Shortly after we passed through Coventry, and after this our journey to London, which we reached at 9.30, with the exception of taking a wrong turn in the dark, and nearly being run into by two horses which had been left unattended at a roadside public house, was uneventful. I was, however, not sorry to arrive, as driving on a pitch dark night on a bad unknown road is not one of the most pleasant things in the world.

Yours faithfully,

6th March, 1900.

J. HOYLE SMITH.

EMERGENCIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have so often found useful hints and suggestions in letters of correspondents that I desire to reciprocate by pointing out two very useful and important emergency "aids" that I have just added to my convertible motor quadricycle. The first is the most ingenious "emergency" stand, already mentioned in your journal as having been brought out by the Speedwell Motor-Car Company, of Reading. The stand is made of very strong wood, and being only 16 inches long when folded, and weighing merely some 12 ounces, can readily be carried anywhere about the machine. It can be as well used for "quads," as for "trikes," and having found its extreme usefulness I should be as reluctant to ride without it as without my bag of tools.

The other "aid" I refer to is a brake. Motor-cyclists are aware that as soon as the usual convertible trike is changed into a quad, the machine loses the front wheel and the band brake generally attached to the same. Thus, instead of obtaining additional brake power for a quadricycle, so necessary for a heavier vehicle, one loses one of the two brakes fitted to the machine. This is a serious disadvantage, as I have experienced. I have, however, got over the difficulty in a very simple and inexpensive manner. The Speedwell Company, of Reading, have entirely removed the band brake attached to the front wheel of the trike, and refixed it to the bottom bracket to which the pedal crank is fixed. The result is excellent. I have now two very powerful brakes for use whether the machine is in the form of a trike or a quad. The experienced rider will understand that, by this arrangement, when both brake levers attached to the handle bar are pulled up, both sides of the differential gear on the main axle are gripped, giving a very powerful and quick brake action.

I enclose my card, and remain, yours,

Reading, March 5th, 1900.

G.

THE MORS MOTOR-CARRIAGE.—VIII.

By "VELOX."

(Continued from Vol. I., page 810.)

BELT ADJUSTMENT AND REPAIR.

HAVING in the last section of these articles dealt with the method of adjusting the tension of the belts employed in transmitting the power from the engine to the intermediary shaft of the Mors car, it now remains to be said that when this means of adjustment is no longer possible, owing to excessive stretching of the belts, or by reason of their joints giving way, it becomes necessary to shorten the belts or to make a new joint, as may be required. This, of course, is at the worst but a comparatively simple operation, but, like most other adjustments, it can be carried out more easily or more exactly in a given way than by any other method. It will be useful, therefore, to describe the method found in practice to be most satisfactory, and in the present section a few hints will be given to this end.

FIG. 24.

- A. Loose pulley, low speed.
- B. Fast pulley, low speed.
- C. Fast pulley, high speed.
- D. Loose pulley, high speed.

- E. Low speed belt under repair.
- F. High speed belt.
- G. Motor shaft.

In the first place, it must be remembered that by the adjusting apparatus last described it is a necessity that both belts are stretched equally at one time. It is necessary, as both belts are of the same length, that the tension should be equal, for if one be slacker than the other the mere fact of tightening the slacker belt would tend to unduly stretch that one whose tension was normal. To secure ease and comfort then it is necessary that the length of both belts, and therefore their tension, should be equal. It arises, however, that by a greater use of one speed, and from other causes, that occasionally one belt is found to have stretched more than the other; it therefore becomes necessary to equalise the tension and to shorten the longer belt.

To commence operations for effecting this it is necessary first to so turn the hand crank-lever that the carrier holding the differential shaft shall be made to travel in a direction towards the back of the car to the full limit permitted by the stops. By

this operation all tension is taken off the belts, both being made quite slack, and it is then quite easy to detach either of them and to shorten it to the greater or lesser extent requisite to gain equal length in both belts.

When this is done, however, it remains to reshuffle the belt, and this is an operation that can be quite easily effected practically without labour if the following hints are followed, but that otherwise becomes a troublesome and disagreeable task.

Let it be imagined that it has become necessary to shorten or make a new joint in the low-speed belt. After having effected the necessary operation let the belt rest in the position shown in Fig. 24, to which it has originally been put in order to effect the shortening. That is, whilst permitting the low-speed belt to occupy its proper position on the motor shaft, to place it on the first pulley of the high-speed gear on the differential shaft. All that is now necessary is to depress the clutch pedal, thus disconnecting the road wheels, and to slowly turn the change speed lever controlling the movement of the belts, whilst at the same time slowly rotating the motor shaft by means of the starting handle.

It then, of course, remains to place the belts in proper tension by moving forward the differential shaft carriers by means of the crank handle provided and fixed to the left of the driving seat.

The carrying out of similar operations with the high-speed belt is effected in the same way, the only difference being that in this case the motor shaft end of the belt is moved on to the low-speed pulley of that shaft.

It occurs, however, no matter what amount of care is exercised to equalise the tension of the two belts, that on adjustment they are still found to be in unequal tension. It then remains to perfect the adjustment by other and more drastic means. Let it be imagined that, in completing the operations just mentioned, it is found that the tension of the low speed belt is too great, and that the tension of the high speed belt is consequently not great enough. Let the motor be started, and the car driven on the slow speed for a short period, whilst the side brakes are put lightly on the road wheels. Under these circumstances the slow speed belt is given work to perform which will immediately tend to its speedy lengthening and consequent release of the tension. On the other hand, if the tension of the high-speed belt is found to be greater than that of the low speed, the former belt should be slightly moistened with water, and when changing from the high-speed gear to the low speed, the crank handle commanding the tension must be so turned as to slacken the tension of this belt.

If at the end of the run it is still found that the tension of the two belts is unequal, and that these operations have produced a result still imperfectly satisfactory, there remains yet another course to be pursued. When the car is at a standstill interpose a wedge of wood between the belt which is too tight and its pulley, next press heavily on the surface of the belt between the two sets of pulleys, until the requisite degree of tension, coincident with that of the other belt is attained.

To summarise the means of controlling the transmission of power we have (a) two levers, (b) two pedals, (c) two brake levers, and (d) a belt-stretching device.

Of the pedals, that to the left hand controls merely the engaging or disengaging of the clutch, whilst that on the right hand not only commands the disconnecting of the clutch, but applies the brake on the differential shaft. The lever on the right hand side, outside the body of the car, controls the hand brake in the nave of the left-hand rear road wheel. Further descriptions of these various appliances will be given, with illustrations, in subsequent sections of these articles.

(To be continued.)

ROBERTSON'S Auto-Car Agency, of Peterboro', have sent us a copy of their 1900 list, which gives particulars of the Rouxel motor-voiturette and tricycle.

THE Hewitt Lindstrom Motor Company has been formed in Chicago, with a capital of £6,000, to manufacture automobiles, motors, steam and electrical engines.

THE LOUTZKY MOTOR-VOITURETTE.

—88—

IT is not only in France that automobile builders are now devoting attention to the construction of light voiturettes adapted to accommodate two persons side by side. Several concerns in Germany are following the example, and this week we are able to illustrate, in Figs. 1, 2, 3, and 4, a vehicle of the kind which has lately been built by the Gesellschaft für Automobil-Wagenbau (system Loutzky), of 49, Französische Strasse, Berlin, W. The motor power is supplied by a vertical two-cylinder petrol-motor of $3\frac{1}{2}$ h.p., fitted with water-jacket and electrical ignition. Two sectional views of the motor, which runs at a speed at from 1,200 to 1,500 revolutions per minute, are given in Figs. 3 and 4. For the purpose of a sure ignition, a straight narrow igniting passage must, Herr Loutzky considers, be employed, which should be filled with, as far as possible, a pure mixture. For this object

FIG. 1.—GENERAL VIEW OF LOUTZKY VOITURETTE.

the exhaust valve is arranged in the narrow igniting passage in front of the suction valve, so that during the compression stroke of the engine only a pure mixture exists at the outermost end of the igniting passage over the valve. It will also be noticed that the inlet valve differs from the general system in that it is mechanically operated. The valve rods lie in one plane with the vertical axis. In order to regulate these

FIG. 2.—VIEW OF REAR AXLE.

valves the controlling levers belonging thereto also lie in a similar vertical plane and are operated by a common cam. The cam-engaging points of both levers are arranged in such a way on a centric angle of 90 deg. that the common cam serves for controlling both the suction valve and also the exhaust valve. In the case of motors which are provided with a means for suppressing the noise of the exhaust it has been found that a back pressure is exerted on the exhaust or discharge gases by the device employed for suppressing the noise. To overcome this back pressure the exhaust valve in the motor under notice is opened a little before the completion of the expansion period, so that a portion of the consumed gases can escape under pressure. With the object of obtaining this quickening of the movement of

the exhaust valve, the valve-controlling cam is provided with a step which operates the lever of the exhaust valve, whilst the shorter projection of the operating lever of the inlet valve is not operated by this step. The motor is located in the rear of the frame, and is geared direct to the rear axle (Fig. 2). Two speeds forward and a reverse motion are available, the variable speed gear being controlled by a single lever on the steering standard connected up to friction clutches.

FIGS. 3 AND 4.—SECTIONAL VIEWS OF LOUTZKY MOTOR.

The car is provided with a device (Fig. 4) which permits the motor to be put in operation from the driver's seat while the steering is controlled by a hand wheel. Ample brake power is available, while a foot pedal is provided by means of which the compression tap is opened at starting. The petrol tank which is located under the seat has a capacity of thirty litres. The water circulation is maintained by a small pump, a water-cooling coil being introduced in the circuit. The road wheels are of the cycle type, fitted with pneumatic tires. It will be noticed that the front steering wheels are not mounted on the usual short vertical pivots, but between forks similar to those adopted in cycle construction. The weight of the Loutzky car is about 250 kilogrammes, or a little under 5 cwt. A speed of 35 kilometres can, it is claimed, be attained on level roads.

A MUNICH firm has secured a concession to operate a number of electric cabs in the town of Würzburg, Germany. In crowded thoroughfares the speed is not to exceed 15 kilometres per hour.

THE municipal authorities of Nuremberg, Germany, have lately officially inspected a four-seated electrical car which is shortly to be put in service in that town by a Cologne firm. The car was built by Messrs. J. Lohner and Co., of Vienna.

Two Frenchmen, named De La Marre and Merville, have left Paris for Havre, where they will embark on board a steamer for America, in order to journey from Bennett to Dawson City in the Klondike on a motor-car. The actual distance they will travel by car will be about 750 miles. *La Locomotion Automobile* states that the car they are taking out is a special one, but details are wanting.

THE grievances under which the automobile car drivers of Paris consider themselves to be suffering are, it would appear, sufficiently serious to demand united action, for these *chauffeurs* have decided to form a syndicate to protect their interests. At least, this was the decision arrived at by a number of drivers who met in solemn council on Saturday evening last, on the premises of a wine merchant in Paris. The main trouble is the question of wages, both as regards the amount itself and the manner of payment. The actual salary is very small, and some of the men are paid daily, while others only receive their money once a month. The drivers state that the tips received do not increase their earnings very materially, and complain that the general tendency of the public is rather to diminish than to augment their "pourboires." The subscription to the new syndicate was provisionally fixed at one franc, and the entrance fee at half a franc. It is intended to hold another meeting to which more publicity will be given, so that a larger attendance of drivers may be secured.

THE CREST PETROLEUM SPIRIT MOTOR.

REFERENCE has already been made in these columns to the petroleum-spirit motor lately introduced by the Crest Manufacturing Company, of Dorchester, Mass., U.S.A., of which we are now able to give an illustration. The motor weighs less than ninety-five pounds, and develops about 4-h.p. The engine which can be speeded from 100 to 2,000 revolutions per minute, is twenty-eight inches long, eight inches wide, and nine inches high, it is arranged to run with one cylinder or two, as may be desired. All the parts of the

motor are self-oiling, as they work in a crank case enclosed from dust. There are, it is claimed, no nuts to get loose, and no adjustable parts. The motor can be taken apart in three minutes by removing the nuts from the bolts and crank-case. All the working parts are then exposed for cleaning and inspection. It is claimed for the igniting device that it is a great advance on anything of the kind now used, but that it cannot be explained at present as the patents are still pending. The device gives all the ranges of speed desired. The motor is entirely automatic, and being horizontal what little vibration it may have is said to be absorbed in the moving carriage.

THE Stringer Automobile Co. has been organised at Marion, O., with a capital of £4,000, to manufacture petrol vehicles invented by Mr. J. W. Stringer.

QUITE a number of applications have been made to start services of motor vehicles in the Tyrol, particularly between Pöten, Bruneck, and Ampezzo.

LA SOCIETÀ MILANESE D'AUTOMOBILI, ISOTTA, FRASCHINI, AND CO. is the style of a new company which has just been formed in Milan, Italy, with a capital of £20,000, to manufacture and deal in motor-cars.

THE Oceanic Automobile Company has been incorporated in New Jersey, with a capital of £80,000, by New York, Philadelphia, and Atlantic City capitalists, to operate automobiles in Atlantic City. It is an offshoot of the Electrical Development Company, of Philadelphia.

It is reported that M. Charron, the well-known French *chauffeur*, has ordered a special racing car, to cost 35,000fr. (£1,400), for the Gordon Bennett International Cup Race. The builders, whose name is not stated, are under engagement to have the car ready in time, or to pay an indemnity of 10,000fr. (£400).

THE new motor fire-engine in Paris fully realised the hopes of its inventors at the two recent great fires of the Trianon Theatre and St. Ouen spirit warehouse, where it rendered valuable assistance in quelling the flames. The new engine carries six men, and is capable of travelling at the rate of thirteen miles per hour.

THE secretary of Ranelagh Club has agreed to submit to his committee a proposal that a motor gymkhana should be given by the members of the Automobile Club at the Ranelagh Club on Saturday, July 14th. It is also being arranged that earlier in the day, in accordance with a suggestion made by the Attorney-General, the motor-vehicles will be at Ranelagh Club grounds, so that nervous horses belonging to members of Ranelagh Club may be sent there and trained to encounter motor-vehicles without fear.

THE PETITJEAN AND SEVETTE VARIABLE SPEED-GEAR.

MESSRS. PETITJEAN AND SEVETTE of 196, Rue Saint Maur, Paris, have recently introduced a variable speed-gear for motor-cycles and voitures, of which illustrations are given herewith. It consists of a train of reducing gears, with this peculiarity, that while always in mesh with the pinion commanding the countershaft, it communicates motion to that shaft only when the low speed is thrown in. Fig. 1 is a sectional view of the mechanism at the moment of passing from the high to the low speed, or the reverse. Fig. 2 shows three positions: Gearing for high speed, low speed, and complete disconnection.

Upon the motor-shaft *a* is a clutch, *b*¹, free to slide along this shaft and revolving with it. In the high speed it engages directly with the hollow shaft *c*, mounted loosely upon the shaft *a*. The toothed part of the clutch *b*¹ is brought into engagement with the toothed wheel *d*, solid with the shaft *c*. The shaft has a toothed part, *d*¹, meshing with the large pinion of the differential shaft.

In the low speed motion is transmitted to the hollow shaft *c* by means of reducing gears and a special clutch device. The clutch *b*¹, shifted along the shaft out of engagement with the pinion *d* of the hollow shaft *c*, rotates the latter by means of reducing gears *e*, *f*, both fixed and revolving on the shaft *g*, the pinion *e* engaging with the coupling *b*¹ and the wheel *f* with the pinion *h*, which surrounds and turns a rack *c*¹, cut in the hollow shaft *c*. In the spaces between the inner rim of this pinion and the rack teeth are friction rollers, *i*, intended to come into play when the pinion is moved in the direction the motor shaft is rotating.

The clutch *b*¹ is shifted by means of a fork, *k*, fixed to a shaft, *l*, operated by a lever located within easy reach of the driver. To change from high to low speed the lever is moved, bringing the toothed part of the clutch into engagement with the pinion, *e*; thus in the passage from high to low speed the clutch *b*¹ is for an instant in mesh with both the teeth of the pinion *d*, fixed to the hollow shaft *c*, and the teeth of the wheel *e*, but owing to the arrangement of the rollers *i*, and the direction of rotation, there is complete separation of the shaft and the pinion *h*, so long as the speed of the shaft is equal to that of the motor shaft. On the other hand, when the teeth of the clutch *b*¹ leave those of the hollow shaft *c* the speed of the latter decreases until it equals that of the pinion *h*. At this moment the rollers *i* become wedged, and the pinion *h* moves the gear *c*¹ and consequently the hollow shaft *c*.

FIG. 1.

FIG. 2.

Consequently the low speed is always thrown in before the high speed is thrown out, and becomes operative only when the motor has reached the same speed, thus avoiding, it is claimed, stripping of teeth, etc. To pass from the low to the high speed it is only necessary to move the clutch *b*¹ in the opposite direction to bring it into engagement with the pinion *d*. To facilitate this it is recommended that the ignition be switched off for a moment. The clutch can also be moved along the shaft *a* past the wheel *e*, so that complete disengagement may be obtained, thus permitting the machine to be brought to a standstill without stopping the motor. The parts of the device are all enclosed, and run in oil. The change of speed is, it is claimed, accomplished without noise or shock by means of a single lever.

DAMAGES AGAINST A MOTOR-CAR DRIVER.

At Coventry, on Tuesday, before his Honour Judge Ingham, a carrier named John Smith, of Bulkington, claimed £12 14s. from George Ormerod, of Foleshill, in the employ of the Daimler Motor Company.—Plaintiff said on the day following August Bank Holiday he was knocked down by a motor-car driver driven by the defendant, and sustained injuries which necessitated his detention in the hospital for twelve days, and kept him away from work for seven weeks.—The defence was that Ormerod used every means to signal the approach of the car, and that plaintiff stumbled in front of it. His Honour, in giving judgment for plaintiff for five guineas, said he thought crossing the road at right-angles was a curious manoeuvre, and one which ought to be carried out with extra care. He thought plaintiff was not to blame if, when he suddenly found the motor-car on him, he ran the wrong way.

MOTOR RACING AT BIRMINGHAM.

THE Birmingham annual theatrical charity sports took place on Wednesday afternoon at Villa Park, Aston, and were an unqualified success. Under the direction of a large and influential committee—a capital programme was carried through. This included footraces, tug-of-war, and a variety of amusing contests, in which the artistes from the theatres and the Aston Villa players participated. The chief attraction was a couple of motor races on the cycle track. In the first heat of the one-mile motor handicap, for a gold medal, J. W. Stocks (scratch) was first, W. Dunn (50 yards) second, and A. C. Edge (50 yards) third. Time, 2min. 2.5sec. The second heat was won by C. Sangster (50 yards), E. Felix (150 yards) second, and C. Sangster (150 yards) third. Time, 2min. 1sec. Final: Dunn 1, Felix 2, C. Sangster 3, Stocks 4. Time, 1min. 54 1-5sec. The race was a grand one. Dunn, who was lying second on coming into the straight, rushed to the front, and won by a length; ten yards between second and third; the fourth close up.—The three-miles motor handicap resulted as follows:—1st heat: W. Dunn (150 yards) 1, J. W. Stocks (scratch) 2, A. C. Edge (150 yards) 3. Won by a yard. Final (including second heat): Dunn 1, Felix 2, Stocks 3, Sangster 4. Time, 5min. 18 3-5sec. Won by 40 yards; 50 yards separating second and third.

THE MOTOR MANUFACTURING COMPANY.

A CIRCULAR has been issued by the Motor Manufacturing Company, Limited, convening an extraordinary general meeting to be held on the 13th inst. to consider proposals for the reconstruction of the company, in accordance with the suggestions of the shareholders' committee appointed at the recent general meeting.

The following is the report of the shareholders' committee above referred to:—

"Your committee, who were appointed at the recent annual general meeting to consider the question of further capital, met on the following day, when the company's position was fully placed before them by your chairman and directors, and it was arranged that such of the members of the committee as could possibly do so should proceed to Coventry for the purpose of inspecting the company's works and forming an independent idea of the position and prospects of the company.

"Four members of your committee (Messrs. Glass, Harris, Barr, and Garnett) were able to meet your chairman (Mr. Gretton), together with Mr. Buckea and the company's manager (Mr. Iden), at Coventry, and carefully went over your works and inspected every department, Mr. Hutchings having previously, and Mr. Holt having subsequently inspected the works. Your committee were much pleased to notice that the works appeared, so far as they were able to judge, to be thoroughly well equipped and to be very ably organised. The various shops were inspected, and the processes were fully explained by your chairman and Mr. Iden. Your committee were very favourably impressed by the appearance of the works, and the machinery in particular appeared to work efficiently and to be in good condition, and to be capable of a greatly increased output, and your committee consider that the statements made by your chairman in his speech at the general meeting were fully justified.

"Your committee have not attempted to investigate the company's accounts, but the company's position was explained, and the committee think the balance-sheet figures in respect of plant, stock, and buildings are not at all over-estimated. Your chairman courteously answered all the enquiries of your committee; and it appears that there is now due to the company's bankers (to whom a debenture has been issued), and to sundry creditors for current liabilities, sums approximately estimated at together £7,000, which we believe to be represented by additional machinery and stock provided and acquired since the date of the balance-sheet, and that in addition to providing for these sums, further working capital is required to enable the business to be properly and efficiently conducted.

"Your committee considered various schemes for raising the capital required. It was suggested that the company should be reconstructed, and that the present shareholders should be offered shares in the reconstructed company, credited with 17s. paid up and with a liability of 3s. per share to be payable as to 3d. per share on application, and 9d. per share on allotment, and the balance to be called up as required. A proposal was also considered for the raising of the money required by the issue of debentures or preference shares, but it was felt

that the nature of the company's property was such that it was doubtful if the money could be raised by this means unless the existing shareholders themselves subscribed for the debentures or shares to be so issued. The former plan therefore appeared to your committee to be the most practicable course, but Colonel Harris and Mr. Garnett, two of the members of your committee, intimated that as they were acting only as proxies for shareholders they could not pledge their principals to any scheme, although they personally concurred in the views of your committee.

"Your committee are strongly impressed with the future prospects of the company, and believe that the organisation which now exists, and which has obviously been the result of much labour and expenditure of money, is well adapted to earning a profit within a reasonably short space of time, and also feel that it would be a disaster if the benefits of the labour and expenditure which have been devoted to the establishment and development of the company's business, should be thrown away for the want of a comparatively small sum of money.

"After carefully considering the position and needs of the company, and the course most likely to lead to the provision of the further capital required, your committee recommend the adoption of the following proposals, viz.:—1. That the company be reconstructed, and that the shareholders in the present company be entitled to receive a £1 share in the reconstructed company credited with 17s. paid up in exchange for each fully paid up share held by them in the existing company. 2. That the balance of 3s. per share be payable as to 3d. per share on application, 9d. per share on allotment, and the remainder as and when required, but not to exceed 1s. per share, or to be called up at intervals of less than three months."

The directors in their circular state that "It will be remembered that at the recent adjourned general meeting it was explained that the company, which is now controlled by directors selected on the shareholders' behalf, had in bringing the business to its present position, found the working capital originally provided not sufficient, and the meeting thereupon from among its number appointed a committee for the purpose of conferring with the directors.

"The board have pointed out to the committee that having regard to the great increase in the company's business further capital can be advantageously employed for the following purposes:—1. To pay for further labour saving machinery, some of which takes many months to make and was ordered some months ago. 2. To enable larger stocks of manufactured cars to be held, both for exhibition purposes, to push the business, and to ensure full prices being obtained. 3. To erect a foundry and smithy to enable the company to make its own castings, instead of having to place this work outside and pay profits to others, a process attended also with great inconvenience and delay. 4. To pay off the existing overdraft at the bank, which overdraft has been rendered necessary on account of the larger business now being done and the larger stocks held.

"In the Directors' report they referred to the high favour in which the company's cars are now held by the public, and the numerous awards they have gained at exhibitions, and in the chairman's speech at the general meeting, he gave figures showing the remarkable expansion of the company's business.

The chairman's speech at the meeting referred to and the committee's report deal fully with the greatly improved position of the motor industry, in which your company claims that it holds the leading position, and there is in the opinion of the board little room for doubt that your factory, with sufficient working capital, used as above indicated, could not only increase its output to the full extent of its capacity and work cheaper, but could sell this output at remunerative prices. It may be added that a general advance of prices has just taken place in the trade.

"The necessary capital to bring about this state of affairs, however, has to be raised, and the directors, who have given careful consideration to the subject, see no other course open to them but to agree with the committee that the only mode of obtaining it is by reconstructing the company. The raising of this working capital by any other means being in the opinion of the board not likely to succeed, they consider that the scheme set forth in the committee's report is the best to adopt under the circumstances. It is as follows:—1. A new company to be formed with a capital of £300,000, divided into shares of £1 each, and the same or a similar name and Memorandum and Articles of Association to be approved by the liquidator of this company. 2. The new company to take over all the property, assets, undertakings, liabilities, and costs of winding up of this company, and carrying the reorganisation scheme into effect. 3. Every shareholder in this company who shall apply upon and subject to the terms of the reorganisation agreement will be entitled to receive from the liquidator a share in the new company for each fully-paid £1 share in this company. 4. Such shares to have 17s. per share credited as paid-up thereon, and the 3s. unpaid upon each share is to be paid as follows:—3d. per share on application; 9d. per share on allotment; and the remainder as and when required, but no call to exceed 1s. per share or to be called up at intervals of less than three months.

"While agreeing with the committee's views, the directors believe, firstly, that it will not be necessary to call up the full amount of the assessment, at least for some time to come. They, however, think the committee are wise in fixing it at a figure which, while it may be thought by some too large, is preferable to one that may ultimately be found too small; and, secondly, that the committee's scheme, providing as it does for an additional £45,000 working capital, will place the new company in

the strongest position in the trade; and that as the market value of the company's shares is now undoubtedly affected by its present financial position, the shares in the new company should advance in value in the market by an amount considerably exceeding the proposed assessment."

THE LONDON MOTOR-VAN AND WAGON COMPANY, LIMITED.

THE report of the directors of the London Motor-Van and Wagon Company, Limited, for the period from 1st April, 1899, to 31st January last, to be presented at a meeting to be held in London on the 12th inst., states that the accounts for the ten months are more satisfactory than any preceding accounts. Not only have several of the items of expenditure been reduced, but the sales effected during last season show a profit. The profit and loss account shows a gross profit of £1,636, and a net one of £393. Accompanying the report is a circular addressed to the shareholders by the directors, who state that they have pleasure in submitting proposals for placing the London Motor-Van and Wagon Company, Limited, upon a business-like footing, and one which will tend to enable the directors to divide among the shareholders by way of annual dividend any trading profits which may be earned. As shareholders are aware, the issued capital of the company at present is 32,400 shares of £5 each, equal to £161,984. Of this sum, 4,800 shares, equal to £24,000, are held by what may be conveniently called cash shareholders, and the balance—27,600, equal to £138,000—were issued as fully paid to the vendors, but do not participate in profits until 6 per cent. has been paid upon the subscribed capital. No dividend whatever could be paid by the directors until the trading loss up to March 31st, 1899—namely, £2,355 10s. 5d.—has been written off out of subsequent earnings, nor until the preliminary expenses and stamp duty had been written off out of earnings and a reasonable sum allowed for depreciation. The total amount, probably nearly £5,000, would have to be added to a 6 per cent. dividend on 4,800 ordinary shares, and would necessitate earnings of net profit available for dividend amounting to between £6,000 and £6,500. Even if this sum can be earned, a great number of years (having regard to the available working capital of the company) must elapse before such even could happen, and in the meantime no part of the profits until they amounted to between £6,000 and £6,500 could be distributed among the shareholders.

The company has, during the past year, earned a profit on trading, valuing the stock at prime cost as hitherto, but writing off £70 13s. 8d. for dilapidations at the company's former premises at Chiswell Street, vacated on March 31st last, and the directors believe that even deducting a fair proportion of depreciation, clear net profit was earned during the past season, and they hope with great confidence that the profit will, as time goes on, increase continuously. At the meeting of the cash shareholders held in November last, the directors promised, if possible, to arrange for the placing of the affairs of the company upon a more businesslike footing, and also to endeavour to obtain new channels of business if a reasonable anticipation of profit could be formed. Both of these promises the directors now feel themselves able to redeem. The first has involved a scheme for the reconstruction of the company. The scheme is one which had its origin in a letter from one of the holders of vendors' shares, who wrote to the then chairman of the company, offering to surrender his vendors' shares for the benefit of the cash shareholders, and the chairman, when retiring from the board, made a similar offer on his own account. Nearly the whole of the holders of vendors' shares have been communicated with, and have been asked to surrender their holdings of vendors' shares in order that the rights held in respect of such shares should be entirely extinguished in favour of the cash shareholders, and a large majority of the holdings have been promptly and generously given up, upon condition that the proposed scheme for reconstruction is carried, and in many cases transfers have been made to the present chairman of the company to enable him to extinguish the rights appertaining to the shares in favour of the cash shareholders. In other cases promises have been made by the holders to concur in the scheme. Absolute refusal to agree has only been received from one holder, and it is probable that there will be no substantial opposition from the remaining holders of vendors' shares, who have not yet consented to the proposal. If, however, contrary to the hope of the directors, the scheme should be defeated by votes of holders of vendors' shares, the directors will be pleased to confer with a committee of the cash shareholders with a view to presenting a petition for compulsory winding up of the company, because the directors are not prepared to accept the responsibility of a voluntary winding up, with the necessity of distributing the assets of the company *pro rata* among the holders of the whole £161,984. Such a distribution would be most disastrous to the cash shareholders, and, if it must take place, the directors would prefer that it should be under order of the court rather than by their own action.

Special remark must be made with reference to one holding of the deferred shares above referred to—that is, the holding of 10,000 shares, equal to £50,000, by the British Motor Company, Ltd. These shares were acquired by the British Motor Company, Ltd., in return for the licence sold to the vendor syndicate, and some considerable difficulty was involved in framing a reasonable and acceptable proposition between this company and the British Motor Company, but the British Motor Company have agreed, upon certain conditions, to permit of the extinguishment of the holding in return for the cancellation of the licence and an arrangement with the new company by which any motor dealt in by the new company other than motors purchased from companies already licensed by the British

Motor Company, Ltd., shall bear a royalty of 5 per cent. upon the selling price to the British Motor Company, Ltd., if the new motor so dealt in infringes any of the British Motor Company's patents. Questions of infringement to be determined by a leading expert. The total numbers of deferred shares already agreed to be extinguished in favour of the cash shareholders are 18,988, or thereabouts, equal to £94,940, including the holdings of members of the Board. Every member of the old company, except those who agree to extinguish their shares for the benefit of the cash shareholders, will be entitled in respect of each fully paid-up £5 share in the old company to claim an allotment of four shares of 10s. each in the new company, with the sum of 7s. per share credited as having been paid up thereon, leaving 3s. per share to be paid to the new company. The directors regret the necessity for creating this burden, but point out that it will fall very lightly upon the cash shareholders in comparison with the holders of vendors' shares, and that if the whole of the vendors' shares had been given up, it would probably not have been necessary to have made any assessment. The other promise of the directors to the cash shareholders at the November meeting has been fulfilled by an arrangement entered into with a manufacturer for the purchase from him of voiturettes of novel design, and in respect of which the directors hope to do a satisfactory trade during the coming season. Unless the hopes of the directors are entirely illusory, the ordinary business of the company, increased by the sales of the new motor, will enable a profit available for dividend to be earned upon the reduced capital of the new company, but that result could not be achieved with the old company in its present position, even with profitable trading for a long period.

THE Locomobile Company of America has opened a depot room in Washington, U.S.A., for the exhibition and sale of the different styles of vehicles made by the concern. In connection with the depot it is the intention of the company to have a repository, where purchasers can have their carriages kept in good order, cleaned, oiled, and charged with fuel and water, ready for use at any time.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. II.]

LONDON, FRIDAY, MARCH 16, 1900.

[No. 54.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

SUNSHINE or snow apparently make little difference to automobilists, and owners of motor-vehicles are to be found indulging in their favourite amusement in fair weather or foul. Two or three weeks ago we referred to the number of cars seen out during the bad weather; the number has been greatly increased in the last few days, and automobiles have been seen in

greater force than ever, voiturettes with seating accommodation for two persons being the favourites, motor-tricycles also being extremely popular. In fact, in some London districts "teuf, teuf" has been almost as common as the "clatter, clatter" of the horses' hoofs. On Saturday last on Richmond Hill were seen an Iveagh Phaeton, an Orient Express, a Marshall car, a quad, and several tricycles—all within a space of a couple of hundred yards. On the following day an even greater number of vehicles were observed in Richmond Park and on the Ripley road, one of the most notable passengers being Sir Richard Webster, Q.C., on the front seat of a "twin Daimler."

The Forthcoming Exhibition.

IN connection with the forthcoming exhibition, which is being looked forward to with interest in automobile circles, it is being arranged that an additional dinner of the members of the club shall be held at the Agricultural Hall on Saturday, April 21st, at 7 p.m., on the termination of which the Right Hon. the Lord Justice Clerk of Scotland has consented to read a paper on "War and Power Traction." Arrangements are also being made whereby a large room at the Agricultural Hall, handsomely equipped and furnished, will be reserved for the use of the members and friends of the Automobile Club during the course of the Exhibition. It is also proposed to organise a ladies' afternoon for the benefit of the wives and friends of the members of the Club.

Mr. A. F. Mulliner's Works at Northampton.

THE name of Mulliner is well known in the motor-car world, being synonymous with all that is excellent in the way of body building in connection with automobiles. We recently went to Northampton for the purpose of bringing down our new Iveagh Phaeton, and while waiting for the car being prepared for the journey Mr. Mulliner kindly showed us round his fine factory. Altogether there are more than 150 men employed at these works, a large number of whom are engaged on motor-cars—a class of work which he has specialised. At the time of our visit over twenty cars were being fitted at the works, while there were orders in hand for many more. For the 1,000-mile Trial he has several aluminium bodies under way, one of which is for Mr. C. Johnson's new Parisian Daimler car. The present extent of Mr. Mulliner's premises is apparently not sufficient to cope

with the business, and extensive alterations are in progress to meet the demand for facilities for an increased output. All motorists evidently know that Mr. Mulliner is the man to build handsome "bodies" for motor-cars.

Northampton to London.

WE left Northampton on our new Iveagh Phaeton at three o'clock in the afternoon, Mr. Mulliner kindly acting as pilot the first part of the way. The roads were in a shocking condition throughout the journey—either being heavy with mud or covered with newly laid stones evidently left to be ground in by the traffic. Despite these bad conditions the motor pulled remarkably well and developed great power. Unfortunately, as no radiator had been affixed, six or seven stoppages had to be made for water, and it was after ten o'clock when we arrived in London. Allowance should, however, be made for an hour's stoppage at St. Albans for refreshment. The way in which the landlords of the inns are realising the needs of motorists was very notable and those on the route from Coventry to London make every provision. At the Saracen's Head, Dunstable, there is a nicely paved yard and stabling for motors and a long hose. From all we were told it is evident this is a favourite house of call with automobilists.

A Private Motor "Garage."

ON another page we are able to publish an illustration of the motor-garage of the Hon. Evelyn Ellis, at Datchet, near Windsor. This gentleman, as is well known in automobile circles, was one of the first to take up the motor-car in this country, and that he is an enthusiastic *chauffeur* is clearly indicated by the illustration, which shows, in addition to several motor-tricycles, a Twin Daimler at the left, an 8-h.p. Panhard, a 5½-h.p. Daimler, an original Panhard adapted as luggage car, and a Panhard car arranged as a fire-engine. In the foreground will be seen the pit over which the cars are drawn to facilitate overhauling and repairing operations. There is little doubt that within a few years such *garages* will be prominent features at large country seats.

Motor-Car Excursions.

THE first trip in connection with the motor-car excursions, to which reference was made in a recent issue, was run on Monday—from Birmingham to Stonebridge and back. A very successful run was made, and the local interest evoked gave promise of good results for the future. Undoubtedly these motor-car excursions should become very popular, and will also have a good effect in causing the public to regard automobiles with greater favour than hitherto. We shall be glad to have accounts of any organised series of excursions or shorter public services, so as to be able to fully chronicle the many developments now being made.

Birmingham Watching.

At the meeting of the Birmingham Watch Committee on Tuesday it was reported that a licence had been granted to the British Electrical Traction Engine Company in respect of an omnibus, and incidentally Mr. Jarvis referred to the proposed excursions by motor-car from Birmingham, and asked if anything had been heard officially of the proposal. The Chief Constable replied in the negative, adding that he understood the Automobile Club were arranging a contest for self-propelled vehicles, which would visit Birmingham and other places. Mr. Thomas asked if the vehicles would require to be licensed, and Deputy-Chief Constable McManus pointed out that "four-in-hands" which made excursions in the summer were so required. The chairman suggested that the matter was not one to be decided off-hand, and the discussion was not carried further.

The Automobile Club 1,000-mile Trial.

WE are now within measurable distance of the 1000-mile Trial, preparations for which are now well in hand. The start is fixed to take place at 7 on Monday morning, April 23rd, at Hyde Park Corner, the Chief Commissioner of the Metropolitan Police having consented to the Trial vehicles meeting on the east side of Grosvenor Place. All the competing cars are, however, to be at the Agricultural Hall, Islington, on the previous Saturday, where they will be officially examined and sealed by the judges. In connection with the Trial a special dinner is to be held at the Agricultural Hall on Wednesday, April 18th, at 7 p.m. The dinner will be open to everyone taking part in the Trial—whether they be manufacturers, agents, private owners, passengers, or paid drivers; and it is hoped that every person taking part in the Trial may be present. The tickets for the dinner may be obtained from our office at the Exhibition, price 2s. 6d. each (without wines). After the dinner a paper will be read on "The Arrangements for the 1,000-mile Trial."

England v. France in America.

FROM Mr. Chas. Jarrott, in New York, we have this week received a letter, in which he refers to the projected motor race between himself and Fournier. "I should have been delighted," writes Mr. Jarrott, "to have raced against him for sport, but no match was arranged for the following reasons: Firstly, open-air racing is impossible at this time of the year. Secondly, I did not wish to complicate matters with reference to the racing rules of the National Cyclists' Association (America) by riding against a professional cyclist. Thirdly, Fournier left for France a fortnight ago. Seriously speaking, it is impossible to race here with the thermometer just a few degrees above zero." In fact, Mr. Jarrott adds that since he reached America he has done more skating and sleighing than motoring.

Carriage Builders and Motor-Cars.

Two trades are claiming the automobile industry as their own, and both cycle manufacturers and carriage builders feel considerable interest in the progress of the motor-vehicle. The *Carriage Builder's Journal*, in its last issue, has a leading article and also a special contribution calculated to impress upon its readers the necessity for devoting attention to vehicles that move without the aid of horses. "That the carriage builder," declares our contemporary, "is the right man to take up and grow with the motor for all classes of road vehicles goes without saying. He is not only in close touch with the vehicle buyers and users of the country, but he is also the inheritor of the accumulated skill and experience of many generations of builders and vehicles." This reasoning seems sound and should appeal to those carriage builders who wish to occupy leading positions in their important industry. But we are afraid that in addition to accumulating skill and experience many of them have gathered a great deal of traditional conservatism. It is this fact which causes not a few to forget that a motor-vehicle is not merely a horseless

carriage. A motor-vehicle should be specially designed and not be regarded as a horse-drawn carriage with the shafts taken off.

A Dictionary Omission.

WE cannot comprehend why our contemporary should speak of "motocars." If the last letter of these compound words is to be dropped we should speak of the "celleman" for cellarman and of the "tracar" for tramcar. Probably all these things will be set right in proper sequence, and the recent date of the revival of mechanical road locomotion is shown in this connection. The 1890 edition of Webster's dictionary has no mention of automobile or automobilism, while motor-car is also absent. The same dictionary knows not autocar, and its definition of *autocar-pian* is foreign to our subject, for it speaks of the "ripened pericarp with no other parts adnate to it."

The Motor-Car Club.

WE have this week received from Mr. F. W. Baily, the secretary, a copy of the report of the committee of the Motor-Car Club for 1899, which is to be presented at the annual general meeting to be held on Wednesday next, the 21st inst. The report gives a brief *resumé* of the several automobile runs and race meetings organised during last year, and concludes with the statement that these will be repeated during the present season in addition to which a hill-climbing competition near London will be organised. At the meeting next week the committee will recommend:—"That the club sanction the transfer of its financial business to a company, called the Motor-Car Club, Limited, and agree to pay all money received to the said company, on the understanding that in consideration of this arrangement—(1) The company will be responsible for all debts incurred. (2) The board of the company will be composed of five directors; at least two of whom will be nominated by the club." Several alterations to the rules as to the liability of members are to be considered, while it is proposed that Rule VIII. shall commence as follows:—"The officers of the club shall consist of president, vice-president, honorary secretary, reporting secretary, and a committee of twelve ordinary members of the club. The officers shall be *ex-officio* members of the committee. Three shall form a quorum."

A Suggestion for a Motor-Bus.

At the Lancashire Steam Motor Company's works at Leyland more than fifty hands are employed, and the manager, Mr. Sumner, has been interviewed by the *Chorley Standard*, to whom he made the confession that he would like to make a bus to carry twenty passengers and 10 to 12 cwt. of luggage with removable seats and fitted with a hood which would give protection against extremes of weather. The weight would be under three tons, and the bus would be fitted with sufficient engine power to make an average speed of five or six miles an hour, including stops. The prime cost would be from £500 to £550, and the weekly working cost would be £4 5s., made up as follows:—depreciation at 10 per cent. on £550, £1; coke at 2s. 6d. per day, 15s.; driver at 30s. a week; oil, grease, and waste, 5s.; repairs, 15s.

A Trip on a Renault Voiturette.

EVER since the little Renault Voiturette illustrated in the *Journal* for September 15 last made its appearance, we have heard good accounts of the performance of this car, but it was not until Sunday last that we had an opportunity of testing its capacity for ourselves, when one of our staff, in company with Mr. Redgrave, of the Comet Cycle and Motor Car Company, of Wandsworth, journeyed out as far as Ditton. The car, which was a new one—it only having arrived from Paris two or three days previously—is both slightly longer and wider than the original model, and has a very attractive appearance. From Wandsworth the route followed was via Wimbledon, Raynes Park, and Kingston, and although only fitted with a 2½-h.p. air-cooled De Dion motor, many of the hills

were taken on third speed. The control the driver has over the car was exemplified between Kingston and Ditton, when owing to a collision between two cyclists immediately in front of us a very quick application of the brakes was necessary. The return trip was made in good style at an average pace of about twelve miles per hour, the enjoyment of the run being only marred by a punctured tire, which had to be repaired, necessitating a delay of nearly an hour ere the journey could be resumed.

More Speed Wanted.

ARE the parsons among the prophets of automobilism? A few weeks ago our correspondence columns contained a letter from a reverend gentleman, who hoped the day was not far distant when he would be able to purchase a motor-car at a very cheap rate. Now the *Christian Globe* is urging that the automobile should be allowed to go quicker. "Parliament," says our contemporary, "has lately fixed the limit of speed at twelve miles an hour; but that is too low, and the sooner it is raised the better." Had such a suggestion come from an ordinary motorist it would have been met with a cloud of dust from scores of local authorities, but who would suspect the *Christian Globe* of any desire against Her Majesty's subjects? And so very little heed has been paid to this latest suggestion for increasing the speed of automobiles on the public highway.

Conversion at Chicago.

THERE is joy in the Chicago coterie of automobilists over the conversion of the South Park Board to the motor-vehicle. It was at the direction of this group of gentlemen that the Chicago park was closed to electric vehicles a little while ago. But experience has since been gained, and the Board is now as heartily in favour of horseless carriages as it was formerly vehemently opposed to such vehicles. It has just been decided to purchase motor-cars for the superintendent and captain of police, on which they will, in future, make their daily rounds of inspection in the park, and the Board has also decided to invest in an automobile watering-cart. No wonder the restrictions on motor-carists in Chicago are being relaxed.

Motor-Wagons for Municipal Purposes.

In our issue of February 16th last we published the report of Mr. T. W. E. Higgins, the surveyor of the Chelsea Vestry, regarding the working of motor-vehicles, and giving also a comparative statement of the prime and annual cost of motor-wagons for which tenders had been received from four builders. We now learn that the Vestry has placed a contract with the Lancashire Steam Motor Company of Leyland for two steam motor-vans at a cost of £475 each. According to the comparative statement prepared by the surveyor, the annual cost of these vehicles, including an allowance of 15 per cent. for depreciation and the driver's wages at £90, amounts to £293 18s. At the time the tenders were submitted, the Thornycroft Steam Wagon Co. offered to sell a vehicle in use by them for £550, this price to cover a watering body as well as the ordinary tipping one. In addition to purchasing the two Lancashire wagons, the

Vestry has taken advantage of this offer, and the Thornycroft wagon, which has been put in repair, is now working in Chelsea.

An Unguided Vehicle.

TALES of motor-vehicles careering about town driverless and wantonly have often been pictured in comic papers, but one has actually been disporting itself in that way—to the amusement of small boys, the alarming of old ladies who saw it coming their way, and the destruction of a lamp-post in its path. The incident occurred to a steam vehicle in New York, the driver having left the carriage by the kerb while he made a call. Steam was up and the engine was reversed. During his absence some boys investigated the machine and pulled the lever. The machine commenced to back, and, striking an obstruction, turned toward the sidewalk and ran over a pedestrian. The moral, of course, is plain. All motor-vehicles should be provided with locking devices of some kind to prevent just such accidents as this.

Motor-Cars in the Colonies.

WE learn that motor-cars are being imported into Victoria in increasing numbers, with the result that the question as to the amount of duty importers shall be called upon to pay has again arisen. When the motors were first introduced the department decided, states the *Melbourne Age*, that they must be subject to the highest fixed rate for "victorias," "broughams," and other high-class vehicles, that is, £40 each, and that also they should pay an additional duty of 30 per cent. on the value of the motor power. It has been found difficult, however, to discriminate between the value of the motor power and the rest of the vehicle, and the Commissioner of Customs has decided that importations shall be classified as "vehicles not otherwise enumerated." The rate of duty will therefore be 25 per cent. ad valorem.

Index to Vol. I.

A COMPREHENSIVE index to Vol. I. of the *Motor-Car Journal* has been compiled, and will be published on Tuesday next. The fact that it contains more than two thousand references is a tribute to the variety of the contents which have been indexed no less than to the care with which it has been arranged, and those who are binding or filing their copies of this *Journal* will do well to make early application. It has been provided with an effective frontispiece in two colours, and will be published at one shilling, at which price it will be supplied by the trade or sent, post free, from the office, 39-40, Shoe Lane, E.C., in cardboard tubes so as to avoid crushing or folding. We may add that this index has been prepared in response to a widely expressed desire on the part of subscribers, and that there may be others who, while not retaining all back issues, may yet like to possess such a guide to information with regard to automobile news during 1899-1900. That being so, early application for copies of the index is particularly requested. Orders can, as we have mentioned, be supplied through any railway bookstall or newsagent, or will be promptly executed, at the published price of 1s., from the office of the *Journal*.

THE HON. EVELYN ELLIS'S MOTOR-"GARAGE."
(For description see page 17.)

THE SPEED OF MOTOR-VEHICLES.

IT will be recollected that Mr. Henry Edmunds kindly offered, through the committee of the Automobile Club, a prize of £10 for the best essay on Speed. The following is the essay which has been adjudged to be the best of those submitted:—

In arriving at a satisfactory definition of what should be the speed of a motor-vehicle it is necessary first to consider separately each class of such vehicles, and taking as a whole the entire body coming within the Government tare limit, I propose to divide it into three classes, and consider each on its merits. Two other vital points should be considered, these being first, the construction of the carriages themselves, and second, the conditions of the locality where they may be used. To take each point seriatim:—

First. —Construction.—Commencing with the heavy motor-vehicles first, these being for the sake of brevity all vehicles of above two tons tare weight unladen. It appears for this class the Government limit of five miles per hour is fair, for although it seems reasonable that a speed of six miles might be permitted, yet in a heavy vehicle the increased vibration and consequent wear at speeds over five miles per hour are at present very marked, unless rubber or pneumatic tires are used, and here so far they have not proved the success they have been on lighter cars. It is significant that nearly the whole of the British heavy motor-vehicle builders state that for this class there is little advantage in exceeding the Government limit.

Coming to the second class, however, which comprises those varying between one and two tons, and assuming the employment of rubber in some form for the tires, we find a higher speed might be permitted; this in the writer's opinion being a maximum on main roads of fifteen miles per hour. This speed, with the advantages of modern construction, and the provision of two powerful and independent brakes, should be perfectly safe. No definite advantage seems to be gained, judging by English experience, in exceeding this, while on the other hand there is considerable risk. These remarks, of course, apply to English conditions, and in no way apply to those cars employed on the Continent or specially built for racing purposes.

The last class, which is that of all vehicles below one ton tare weight, and of course includes motor-cycles of all descriptions, again on the point of construction permits of a very high speed being safely employed, both on account of their lighter character and also the fact of their being usually fitted with pneumatic tires. On the other hand it should be remembered that this class is far more numerous, and therefore the speed should not be too high. For the reasons before stated, it seems that 20 miles an hour should be the maximum for this class on main roads.

Second. —Locality.—It is obvious this is an important point. As before stated on good main roads a high speed rate may be permitted, but for street traffic the conditions are entirely different. Bearing in mind the strong point of the difference between the general conditions in England and the great nations of the Continent, as example the French, both as to the roads and laws affecting motor-cars, we must remember the entirely different aspect of the question in each case. It is to be feared that in a small country as Great Britain, and with the numerous interests and prejudices to meet and study, a single set of regulations would not operate fairly in each district.

The writer may, however, indicate that the estimation and regulation of the speed of motor-propelled traffic should not be left to persons with little or no knowledge of the subject, and would venture the proposal that should the growth of the motor-vehicle industry continue, that each large centre of traffic should be provided with a certain number of competent persons to be attached to the police force, these being properly certified and examined, and who should be stationed at proper points for the express regulation of motor-vehicle traffic. As to the first class of vehicles the speed may well remain as before for street traffic, for experience shows that the heavy motor-vehicles at five miles

an hour are under perfect control, and there are very few localities where this speed might be called excessive.

It is, however, very different with Classes II. and III., which I will consider together. In order to protect foot passengers and users of the highway, I would suggest that in passing through towns the speed of each class be reduced to one-half for Class II., and one-third for Class III., i.e., $7\frac{1}{2}$ miles and $6\frac{2}{3}$ miles. If, however, this is considered awkward, I would suggest the alternative plan of reducing both classes to a uniform speed of 8 miles an hour through towns, and this speed not to be exceeded on cross roads less than 20 ft. clear width. It is perhaps too much to expect, but considering the fact that these classes are by far the most numerous, and also that action is being taken by local authorities to get the speed of motor-vehicles reduced, it is suggested Parliament might be approached with a view of preventing interference with motor-vehicle speed by local bodies, by fixing a minimum speed for these vehicles as far as regards Classes II. and III., below which (except as stated through towns) it should be impossible for these authorities to reduce it without proper authorisation, or the proof of the state of the traffic or locality demanding it, and that if such was the case a board should be placed prominently visible with directions as to speed reduction in large letters similar to the well-known "Cyclists' danger boards."

With the provision of traffic regulation by certificated experts and the enforced observance of the rules of the road by all, the foregoing speeds should be perfectly safe. PRECURSOR.

THE *Manchester Courier* is among the latest provincial journals to publish "Automobile Notes."

THE French and German Automobile Clubs are making arrangements for a motor-car race between Paris and Berlin, in 1901.

A COMPANY has just been formed in Paris (29, Avenue de la Grande Armée), with a capital of £48,000, to be known as La Société des Automobiles, Louis Ravel.

MESSRS. J. C. KINGMAN, of the Locomobile Company of America, delivered a lecture on steam vehicles before the American Automobile Club in New York a few days ago.

MR. FRANK BUTLER has driven his new 6-h.p. Panhard from Paris and has arrived in London. He was assured by the Baron de Zuylen that he intended to take part in the forthcoming 1,000-Mile Trial, and also by the MM. Lemaitre that they would be driving their 25-h.p. Peugeot throughout the trial.

"MOTOR-CARS, Past, Present and Future," is the title of a lecture which is to be delivered by Mr. E. Shrapnel Smith, the honorary secretary of the Liverpool Self-propelled Traffic Association, at the Mechanics' Institute and Technical School, Horwich, on Wednesday next, the 21st inst. The lecture will be illustrated by a series of lantern slides.

THE Ariel Motor Company, Limited, has just been registered, with a capital of £5,000, to carry on the business of manufacturers, importers, and exporters of, and dealers in motor-vehicles, cycles, velocipedes, and all kinds of domestic vehicles, both wholesale and retail. The number of directors is not to be less than three. The first are: Mr. S. F. Edge, Mr. C. T. Sangster, and Mr. J. W. Stocks.

A NEW motor-bicycle has lately been introduced by the Steffey Manufacturing Company, of San Diego, Cal. The motor and driving apparatus is very compact: it will go between the cranks of a narrow-tread bicycle, thereby enabling the rider to use the pedals, if necessary. The motor weighs about twenty pounds. It has electric ignition, is fitted with radial ribs for air cooling, or with a water jacket, to suit the purchaser. The motor and attachments are so designed that they can be attached to any diamond frame machine, or be detached therefrom, in a very few minutes. Any speed from six to twenty-three miles per hour may, it is claimed, be obtained, and a ten per cent. grade can, it is said, be mounted with ease. The speed is controlled by a small lever near the handle-bar, or by an electric button close to the handle-bar.

LA COUPE DES VOITURETTES.

(From Our Own Correspondent.)

THE fine weather has come to Paris at last, and *chauffeurs*, in common with the rest of the Parisian world, are bent upon giving it a right hearty welcome. Each day great numbers of automobiles are to be seen scudding hither and thither, while upon special occasions, such as the race of Sunday last, the very air throbs with the sound of the motor. I fully anticipated that there would be a crowd of men and motors at the *contrôle de départ* at Chambourcy on Sunday morning, but the actual attendance fairly surprised me. Shortly after 7 o'clock Saint-Germain became alive with cars, some coming in from Paris, while others made their appearance from local stable-yards and *garages*. These latter vehicles were competitors in the race, and their owners had taken the precaution of running them out from Paris to Saint-Germain the previous evening, the wisdom of

47, Morg; 50, Demester; 51, Delisle; 52, Emile. *Series B.* Cars weighing less than 500 kilos, water-cooled motors: 12, Hugot; 14, Ullmann; 15, Ravenez; 16, Dubois; 17, Delautre; 18, Klauss; 19, Vehel; 20, Théry; 21, Paul Louis; 22, Creux; 23, Terreau; 24, Doriot; 25, J. Richard; 27, Mercier. *Series D.* Cars weighing less than 500 kilos, air-cooled motors: 61, Van Berendonck; 62, Fernandez; 63, Gaillat; 64, d'Arnaud; 66, Laurent; 68, Lefèvre. A total of thirty-five. These were despatched by Mr. Lucenski, the director of *Le Journal des Sports*, in two divisions, series A. and C. leaving at 8.34 a.m., and series B. and D. at 9 o'clock. The majority of the cars were if anything more hideous than last year's racing voiturettes, for in many cases everything but the motor and frame had been dispensed with, the driver being perched on a board. In some instances the passenger was afforded the luxury of a seat beside him, in others he was required to make himself at home upon the frame, from which even the bottom boards had been removed. Osmont, on a three-

START OF CARS IN CATEGORIES A AND C.

GIRARDOT ON 12-H.P. PANHARD CAR WITH CHARRON RACING BODY.

A 16-H.P. MORS WAGONETTE.

LEVEGH ON 16-H.P. MORS CAR, WITH PAUL MEYAN ON 12-H.P. PANHARD CAR BEHIND.

which proceeding is at once apparent to all who are acquainted with that terrible stretch of road lying between the two towns.

A considerable crowd had assembled in the Place Royale even at that early hour to witness the weighing of the competing vehicles, while a steady stream of enthusiasts, either mounted or on foot, was making its way out to the scene of departure. This was the little village of Chambourcy, which is situated on the route de Quarante-Sous, about a mile from the Grille de Henne-mont. Here in front of a small restaurant, rejoicing in the magnificent title of "Au Repos de la Pédale," was placed the *contrôle*, and here, as they arrived from Saint-Germain, the competitors were ranged up into some sort of order. There were many absentees among the fifty-seven voiturettes which had been entered for the race, the actual starters being:

Series A. Cars not exceeding 250 kilos in weight water-cooled motors: 2, Cannes; 4, Echalié; 7, Blondin; 9, Dermillard. *Series C.* Cars not exceeding 250 kilos in weight, air-cooled motors: 31, Schrader; 35, Dompét; 36, Tart; 40, Le Saout; 41, Picard; 43, Biquet; 44, Osmont;

wheeled Phébus-Aster but very little larger than a perambulator, seemed to carry his passenger round his neck, such a wedged-in appearance did that unfortunate individual present. The whole aspect of these racing voiturettes gave me the impression that everything had been sacrificed in the attempt to obtain power with lightness, and that neither the question of endurance or of safety had entered largely into their construction. Almost invariably the motors are too strong for the frames, and the frames far too light for the road strains to which they are put, with the natural result that they simply fall to pieces when a trip of any length is attempted. The speed is great for the class of vehicle, but the average shown at the end of the journey is low on account of the continual breakdowns. Whatever success the voiturette has attained as a pleasure vehicle it certainly has not distinguished itself up to the present as a racer, and as Charron remarked to me when the last batch of competitors had disappeared down the road, "There are not many there that will make a good show"—so it proved.

Once the competitors had got under way the crowd of

spectators quickly dispersed, some returning to Saint-Germain to await the finish, while others set out to intercept the competitors on their return journey. I, on the front seat of M. Brierre's quadricycle, was among the latter, and we made our way through the forest to the Route des Loges, from where we commenced our run over a portion of the course, but in the opposite direction to that of the races. The last of the *contrôles*, which was placed at the famous Croix-de-Noailles, was quickly reached, and then we sped on over magnificent roads and through delightful scenery to Poissy. Once through the town we made tracks for Triel, and there found upon the bridge spanning the river a number of friends, who had made a brief halt to admire the beauty of the picturesque little village nestling against the side of the hill. Again getting under way our party mounted on one voiturette, three quadricycles, one motor-cycle, and a bicycle or two, made a quick, but very dusty, run to Meulan, 43½ kilomètres from Paris, where we found René de Knyff, Charron, Huillier, and many other *chauffeurs* lunching, previous to seeing the passage of the returning voiturettes. Of these latter, Théry, driving a Decauville fitted with two motors in front and two behind, was the first to pass at 1.9 p.m. Twenty-nine minutes later Tart went by nursed by Girardot and Clément in their 12-h.p. Panhards. Demester, on a Gladiator, followed, but before getting clear of the village broke down, hard lines when so well placed, and only 20 kilomètres from the finish. Doriot (Peugeot), Ravenez (Decauville), G. Richard (Richard), Ullmann (Decauville), Creux (Peugeot), and Delautre (Hurtu) came after in the order named, and then we waited for no more, but set out ourselves for Saint-Germain.

At every point of vantage there were groups of people and we met several automobilists driving out, among others being Baron de Rothschild on his 24 h.p. German Daimler. No competitor overtook us *en route*, indeed, Osmont, who was the first to finish after our arrival, was twenty-five minutes behind his predecessor, Delautre. The others came in at lengthy intervals, the classification and net times of the first twenty being as follows:—1, Théry (class B), 4h. 51min. 4sec.; 2, Tart (class C), 5h. 46min. 55sec.; 3, Ravenez (class B), 5h. 56min. 47sec.; 4, Doriot (class B), 5h. 58min.; 5, Ullmann (class B), 6h. 18min. 11sec.; 6, Creux (class B), 6h. 22min. 51sec.; 7, Delautre (class B), 6h. 26min. 12sec.; 8, Max Richard (class B), 6h. 38min. 55sec.; 9, Mercier (class B) 7h. 16min. 25sec.; 10, Osmont (class C), 7h. 17min. 8sec.; 11, Paul Louis (class B), 7h. 28secs.; 12, Camus (class A), 7h. 36min. 50secs.; 13, Delisle (class C), 7h. 40min.; 14, Schrader (class C), 7h. 45min. 2secs.; 15, Hugot (class B), 7h. 45min. 3sec.; 16, Couturier (class C), 8h. 3min. 38sec.; 17, Lefèvre (class D), 8h. 2min.; 18, Teneau (class B), 8h. 16min.; 19, Demester (class C), 9h. 14min.; 20, G. Richard (class C), 9h. 56min.; 21, Klauss (class B), 10h. 14min.; 22, Paul Picard (class C), 11h. 21min.

Classified by series the placings are as follows:—*Series A.*—1, Canus, in 1h. 36min. 50sec. *Series B.*—1, Théry, in 4h. 51min. 4sec.; 2, Ravenez, in 5h. 56min. 47sec.; 3, Doriot, in 5h. 58min.; 4, Ullmann, in 6h. 18min. 11sec.; 5, Creux, in 6h. 22min. 51sec.; 6, Delautre, in 6h. 26min. 12sec.; 7, Richard, in 6h. 38min. 55sec.; 8, Mercier, in 7h. 16min. 25sec.; 9, Paul Louis, in 7h. 28min.; 10, Hugot, in 7h. 45min. 2sec.; 11, Teneau, in 8h. 16min.; 12, Klauss, in 10h. 14min. *Series C.*—1, Tart, in 5h. 46min. 55sec.; 2, Osmont, in 7h. 17min. 8sec.; 3, Delisle, in 7h. 40min.; 4, Schrader, in 7h. 45min. 2sec.; 5, Couturier, in 8h. 3min. 38sec.; 6, Demester, in 9h. 14min.; 7, G. Richard, in 9h. 56min.; 8, Paul Picard, in 11h. 21min. *Series D.*—1, Lefèvre, in 8h. 9min.

The smaller cars fitted with water-cooled motors made but a very poor show, while the vehicles entered in the heavier category and provided with air-cooled engines made an even worse display. And this latter result only bears out the opinion so frequently expressed that the larger sizes of air-cooled motors are not practical, and makers must sooner or later abandon the type. The winners in the two other categories did excellently, especially considering the difficulties of the course. Théry's time of 4h. 51min. 4sec. for the distance of 217 kilomètres gives an average speed of 44 kil. 700 mètres per hour, while Tart averaged 37 kil. 600 mètres in covering the route in 5h. 46min. 55sec.

The only accident recorded was that to Blondin, whose car in passing over a *caniveau* came to grief, and brought about a dislocated shoulder to its driver. But no mishaps occurred to spectators on the return journey to Paris, which is something to be wondered at, for, added to some hundreds of automobiles, there were literally swarms of cyclists, and the dust was perfectly blinding. The promoters of the race should be well satisfied with the result of their efforts, and will doubtless demonstrate their satisfaction at the support accorded them by deciding to make the fixture an annual one.

CORRESPONDENCE.

EMERGENCIES.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—Referring to your correspondent's letter in your last issue I would draw his and your readers' attention to a machine sold by Messrs. William H. M. Burgess, Limited, which I am able to use as a tricycle or quadricycle without the three land brakes on the back axle being interfered with on my converting same. Another most ingenious improvement in connection with this machine is that in the event of my tricycle being taken apart for repair the electric circuit is divided into two parts by means of a terminal plate placed near the seat lug. I am, therefore, able to separate the back part of the frame without taking the electric wire out of the tubing. I am also able to keep this machine in an out-house, as it will pass through a doorway 38in. wide.

Hoping these few points will interest your readers,

Yours faithfully,

Craigmonnie, Finchley, N.,

LORNE WALLET.

March 13th, 1900.

THE LEVENN MOTOR-VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—In your issue of January 12th last I noticed a description of the Levenn Motor-Voiturette, and have been looking out for further information as to the running of this car. I should be very glad if you or any of your readers could afford me any information as to the working of this car, and especially whether the frictional driving gear is satisfactory or not.

Birmingham,

Yours truly,

March 12th, 1900.

A. E. C.

THE Winslow Motor Carriage Company is a new corporation, organised, with a capital of £20,000, under Delaware laws to do business in Philadelphia.

"THE Automobile in the Army," was the subject of a paper recently read at Lyons by a French military officer. The author considered that the motor-car was likely to prove of great service in connection with military operations, particularly in the Colonies, by affording a rapid means of communication between the main depot and outlying stations.

THE Maltby Automobile Company, of Clinton Street Brooklyn, N.Y., U.S.A., have lately introduced a small 2-h.p. vertical petrol-motor on the lines of the well-known De Dion engine. A noticeable feature is the large surface-cooling area secured by the closely-placed and broad ribs radiating from the explosive chamber. Another important point is the provision for quickly taking apart the motor and accessories. The side studs connecting the cylinder to the casing which usually pass through the head, and require a considerable time and effort to take off, are so placed that a few turns of the nuts will permit them to be slipped out and the combustion chamber and cylinder removed. The sparking plug can also, it is claimed, be taken out by hand, without the use of tools. Three different methods of sparking, the "jump spark," "contact," and "rubbing contact," have been developed, any one of which can be put on at the option of the purchaser. A light motor, weighing about twenty-two pounds, is also being built by the Maltby Company for bicycles.

THE EARLY DAYS OF THE DAIMLER CAR.

It must have been a matter of considerable satisfaction to the late Herr Gottlieb Daimler, whose death was recorded in our last issue, that he had lived to bring his automobile to a state of relative perfection and to see it brought into every-day use in considerable numbers in almost every part of Europe. That the Daimler car as we know it to-day is the result of many years' experiment and slow but steady improvement by Herr Daimler and others it is hardly necessary for us to remark, and

FIG. 1.—DAIMLER MOTOR-BICYCLE (1885).

the accompanying illustrations of some of his earliest productions may not be without interest at the present time. As stated in our last issue, it was in 1882 that the deceased gentleman relinquished his appointment with the Gas-Motoren Gesellschaft of Dantz, Cologne, to devote himself to the introduction of a light high-speed petrol motor. His first automobile production was a so-called bicycle, but as will be seen from Fig. 1 it was a four-wheeled affair, there being, in addition to the two large wheels,

FIG. 2.—THE DAIMLER CAR OF 1889.

two small wheels, one on each side, just forward of the rear wheel. It was in 1885 that this machine first made its appearance, and although it looks, in modern eyes, very much of a monstrosity, it is undoubtedly the progenitor of the now largely used car. The frame of the machine was constructed of wood, the driver sitting on the petrol tank. The motor was of the air-cooled single vertical-cylinder type of $\frac{1}{2}$ h.p.; it was fitted with tube

ignition and was located in the centre of the frame, practically between the driver's legs. Two speeds were provided, the power of the engine being transmitted by a belt to a countershaft, the latter being geared by pinions to a spur gear attached to the rear wheel. The motor could be cut out from the transmission by means of a jockey pulley, which acting on the belt caused it to grip or run slack as desired. Another feature was that the same lever which controlled the jockey pulley operated a brake. Early in 1886 Herr Daimler fitted one of his motors to a wagonette (see Fig. 3). In this the motor was of a larger size, but the same method of transmission as in the bicycle was adopted. Figs. 2, 4 and 5 show the two-seated car exhibited by Daimler at the

FIG. 3.—THE FIRST DAIMLER CAR (1886).

Paris Exhibition of 1889. As will be seen, the frame of this car was built up of steel tubing, which was also made to serve for the circulation of the cooling water. The car was propelled by means of a two-cylinder inclined motor, located under the rear seat, geared by spur wheels to the rear axle. A friction clutch was introduced between the motor shaft and the continuation of the same carrying the spur wheels. Four speeds were available, ranging from six to nineteen kilometres per hour. The front

FIGS. 4 AND 5.—ELEVATION AND PLAN OF THE DAIMLER CAR OF 1889.

wheels were carried in forks of the cycle type, while the steering was controlled by a long lever. As to the progress which has been made since that time in the construction of German Daimler cars an excellent indication of this will be found by reference to the illustration of the 23-h.p. racing car in our issue of December 1st last.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The Shephard Motor-Voiturette.

M. E. F. SHEPHARD, of 128, Rue du Bois, Levallois (Seine), France, has recently introduced the neat two or three-seated voiturette illustrated herewith. The motive-power is supplied by a Doré horizontal two-cylinder petrol-motor of the type illustrated in the *Motor-Car Journal* for December 8th, last. It has two cylinders, the carburetter and inlet and exhaust valves forming a bridge over the central crank-shaft. Large radiating fins are provided round the cylinders and valve chambers, the latter being also provided with a water jacket.

The motor, which is of 5 h.p., is located transversely under a perforated metal bonnet in the fore part of the frame. The power of the motor is transmitted to a countershaft by belting. This shaft is geared by spur-wheels to a differential shaft, and thence to the rear wheels by chains. Three speeds 10, 18, and 36 kilomètres per hour are available, and the car, which is claimed to be an excellent hill climber, is steered by a sloping hand-wheel. Ample brake power is provided, while the wheels are of the cycle type with pneumatic tires. The car, which, as will be seen, takes the form of a duc with hood, has an attractive appearance.

Another New Club.

THE most recently organised automobile club in France is that of Auvergne, which has commenced operations with a roll call of twenty-three members. All the same the new club has what many of the larger societies are still without, and that is a *garage* and repairing shop. The club's officials are: President, Dr. Pajolat; vice-presidents, MM. Guyot and Gendraud; secretary, L. Pestel; assistant secretary, D'Arcis; treasurer, Baisle; road captain, Dartigat; committee, Baratte, Guyot-Lafont and Rebois. This only leaves thirteen ordinary members, but under the able presidency of Dr. Pajolat the new club will doubtless grow apace, and in course of time will become a power in Auvergne. Good luck to it at any rate.

A Liege Accident.

LAST week at Liège there occurred an automobile accident, which, by reason of the singular injuries sustained by the victim, presents extraordinary features. A well known *chauffeur*, Monsieur Weefs, was driving his car at a moderate speed along the Rue des Guillemins, and when about to turn into the Avenue d'Avroy he was compelled to swerve violently in order to

avoid a couple of pedestrians, who were in the roadway. In doing so he unfortunately knocked down a third pedestrian, a certain Madame Rogister. This unfortunate lady in some unaccountable manner became entangled in the wheels and the transmission gear, and when eventually released, was found to be literally scalped. In the absence of precise details, it is difficult to understand how this came about exactly, although the necessarily exposed condition of driving chains, etc., renders such accidents only too possible.

La Coupe de Vitesse.

FOR many days after the recent Pau meeting the subject of conversation at the "A.C.F." was the extraordinary average of seventy kilomètres per hour made by M. René de Knyff in the "Circuit du Sud-Ouest," and the result of these conversations is now manifest in the challenge cup to be known as "La Coupe de Vitesse." It is due to the Baron de Dietrich that this new trophy is forthcoming, for the desire to mark his admiration of M. de Knyff's wonderful performance lead him to propose the creation of this challenge cup and to head the list of subscriptions with a donation of £20. The idea is to present M. de Knyff with the cup, which shall remain in his possession until such time as his record average speed per hour has been beaten over a route of at least the same distance as that of the "Circuit du Sud-Ouest," that is to say, a distance of 335 kilomètres, or 209½ miles. Subscriptions to the cup are being received at the "A. C. F.'s" club house.

The Race for Electric Cars.

THE competition for electric vehicles, promoted by *Le Sport Universel Illustré*, and generally known as "Le Challenge de l'Electricité," will take place on Monday, May 14th, over a route from Paris to Meulan and back. Upon finishing the *course* each competing car will be required to run round the Longchamps track until its batteries are exhausted, and special prizes will be awarded to those vehicles demonstrating the greatest endurance in this respect. This same plan was in force last year, when the race was decided over a fifty-kilometre route on July 30th. On that occasion the fastest cars were the Columbia vehicles, and a Bouquin-Garcin-Schivve proved itself to possess the best staying powers, as it ran a distance of 126 kilomètres (78½ miles) on one charge; this, too, at an average speed of 20 kilomètres per hour. I had a short spin on one of these B.-G.-S. cars only a few days ago, and was greatly struck with its easy running, the smoothness of which was greatly aided by the employment of the new pneumatic compound tire manufactured by M. Falconnet.

The late Herr Daimler.

IT was on the 7th inst. that we in Paris learnt with profound regret of the death of Herr Daimler, and many were the reminiscences exchanged by those of us who had had the privilege of knowing personally "Papa Daimler," as he was affectionately termed by French automobilists. Quite a gloom was cast over the "A. C. F.," where so many members retain vivid recollections of his charming personality, and on every side I heard expressions of deep regret at the loss of one whom automobilists will always remember as the founder of the industry. Mme. Emile Levassor, M. Sarazin, and M. Hippolyte Panhard journeyed from Paris to attend the funeral of their lamented friend, and the Automobile Club sent a wreath to Cannstatt in token of the esteem and respect with which Herr Daimler was regarded by all the members. It is thirteen years ago since the first Daimler patents were taken in France by M. Sarazin, and a couple of years elapsed before MM. Panhard and Levassor actually commenced to manufacture. It was on December 12th, 1889, that the first car constructed by them under the Daimler patents was turned out from the works, and from that time onward the progress has been one triumphal march.

Attempts on Records.

At the Parc d'Achères, on Wednesday, the 7th instant, Rigal made a series of unsuccessful efforts to beat the record for the kilomètre made by Béconnais on January 23rd last. The weather was fine and the road in capital order, but, unfortunately for him, the would-be record breaker had to battle against a strong head wind, and it was due to this cause alone that his efforts were not crowned with success. As is generally known Béconnais' record for the kilomètre with flying start is 42½sec., or at the rate of 84 kilomètres (52½ miles) per hour. Rigal's four attempts resulted as follows:—1. 46½sec.; 2. 45sec.; 3. 44sec.; 4. 43½sec. Rigal has every intention to make another attempt at the earliest favourable moment, and then, if he succeeds, we may expect to see Béconnais promptly set up new figures to his own credit again. And so the game goes on!

It is stated that a member of the Automobile Club Belge is about to attempt a record ride between Paris and Brussels.

We understand that M. Serpollet, the well-known French builder of steam vehicles, has lately constructed a light steam car, in which the weight of the boiler does not exceed 40lbs.

THE McLachlan Engine Company, 14, Holborn Viaduct E.C., are, we understand, now prepared to make steam engines to any pattern car that may be desired by intending purchasers.

THE *Daily Chronicle* states that the German Emperor has offered a prize of £4,000 for the best automobile war carriage, which is to combine all the requisites for service in the field. We have so far seen no reference to the matter in our German contemporaries.

A NORTH London firm, which is devoting much attention to automobiles is the Kingscote Cycle Company, of 202, Seven Sisters-road, Finsbury Park. We understand that they are at present engaged on the construction of a two-seated voiturette to their own designs.

THE ABBEY WORKS COMPANY, LIMITED, has been registered with a capital of £5,000 to acquire the business carried on at Tintern, Monmouthshire, as the Abbey Works Company, and to carry on the business of manufacturers of block tin,terne plates, and motor-car manufacturers, &c.

MESSRS. J. CARTER, SONS, AND CO., New Bailey Street, Salford, Manchester, have sent us a copy of a new list of tools for cycle and motor-car builders and repairers they have just issued. Any firm who is contemplating laying itself out for the repair of automobiles of all kinds would do well to procure a copy of the same, as it contains particulars of quite a number of useful tools.

MANY of the members of the Automobile Club are finding their cars of advantage in rendering them independent of the last train when in town in the evening for dinners, etc. Thus at the meeting of the club on Wednesday last it was noted that several came down in their cars ready dressed for the dinner, the vehicles being kept waiting to convey their owners home at the close of the proceedings.

WE hear that Dr. Lehwiss, of the Automobile Association, has just gone over to Paris to bring over the Vallée racing car, with which he took part in the Paris-Ostend race last year, and which was illustrated in the *Motor-Car Journal* for October 13th last. It is probable that this vehicle will be seen on the stand of the Automobile Association at the forthcoming exhibition at the Agricultural Hall.

A GIGANTIC torchlight procession in aid of the Soldiers and Sailors' Widows and Orphans' Fund perambulated the streets of Brixton, S.W., on Wednesday and Thursday nights. A feature of the procession was a number of motor-cars and cycles, one of the former carrying a model of Eddystone Lighthouse. Arrangements are also in hand to hold a similar torchlight procession in Penge and vicinity on the 28th and 29th inst., in aid of the *Daily Telegraph* War Fund. The assistance of any automobilist willing to take part in the procession is invited.

THE TOURAND MOTOR-CAR.

MESSRS. TOURAND and CO., of Havre, are the builders of the two-seated petroleum-spirit motor-car depicted in the illustration on page 27. The motor is located in the fore-part of the frame under a bonnet; it is of the Crozet type, the feature being the employment of two balanced cylinders, with only one inlet and one exhaust valve. It is capable of developing 6 h.p., and is fitted with electrical ignition and water-jacketed cylinders. All the working parts of the engine run in an oil containing case. The power of the motor is transmitted through pinions to the differential shaft, and from the latter to the rear axle by the usual sprocket wheels and chains. Four speeds forward and one reverse motion are available, all controlled by one lever; a feature of the variable-speed gear, which is enclosed in an oil-case, being that the various pinions are always in mesh. The frame of the car is built up of steel angles, while the steering is controlled by an inclined hand-wheel. A clutch is interposed between the motor-shaft and the variable-gear shaft, so that the engine may be instantly cut out from the transmission. Three brakes are available, a band brake, operated by a foot-pedal, and working in conjunction with the clutch on the differential shaft, and band brakes on the hubs of the rear wheels, controlled by a hand lever at the side. The road wheels are of strong construction, and are shod with Michelin pneumatic tires. Special attention is said to have been paid to lubrication; the car, which, as will be seen, has quite a racy appearance, weighs, complete, about 14 cwt.

THE BONNEVILLE MOTOR-TRICYCLE SADDLE.

THE accompanying illustration shows a new saddle for motor-tricycles which has lately been put on the market by M. L. Bonneville, of 52, Boulevard Carnot, Toulouse, France. It is of the pneumatic type and is mounted on springs.

As will be seen, it is provided with a back and arms which give the rider a comfortable seat, while not, it is claimed, interfering with the operation of pedalling when this is necessary. The saddle is provided with a central groove, in which are ventilating holes in order to give the rider the advantage of a cool seat. The saddle is made in either pegamoid, leather or pigskin.

A MOTOR-CAR having been left at a certain inn near Tamworth last July, and since unclaimed, is about to be sold by auction, unless claimed without delay.

A MEET of the members of the Automobile Club and a club dinner is to be held at Sheen House Club, on Saturday, April 7th. On April 11th the Club will also hold a 100-mile and hill-climbing trial.

THE AUTOMOBILE ASSOCIATION, LIMITED, Princes Road, Holland Park Avenue, London, W., inform us that they have made a large contract for the delivery of De Dion voiturettes in England, and can always specify exact date of delivery.

THE Ocean Accident and Guarantee Corporation, Limited, of 27, Chancery Lane, W.C., have arranged to grant a special policy of insurance to cover the third-party risks of persons and property of those taking part in the forthcoming 1,000-mile trial from 22nd April to 13th May at a premium of two guineas—the policy to cover a total sum of £500 on the understanding that no one claim shall exceed £250, and to cover damage to the car itself up to £35.

THE MOTOR-CAR OF TO-DAY IN EUROPE AND AMERICA.

A DINNER was held at the Automobile Club on Wednesday evening. Mr. A. J. Walter was in the chair, and there was a full attendance of members. Afterwards, Mr. H. Sturney read a paper on "The Motor-Car of To-day in Europe and America," an abstract of which we print below.

The autocar has doubtless grown so closely into the lives of members of this club that they forget how young the industry really is, and that it is barely three years since the first modern commercial car was produced in Great Britain. But, although the time which has elapsed since then is not great, it can be fairly said that the advance of the industry, when the difficulties it had to encounter are remembered, has been little short of marvellous. I speak particularly of England, but the same may be said of other countries, for the demand has increased enormously in France—where the industry virtually originated—and in America, too, although a financial "boom" in motor-car companies is just now in progress, the foundations have been laid for a sound and progressive industry, which to-day is entirely unequal to supplying the demand of the public. Broadly speaking, now, as three years since, motor-cars may be classified under three main heads, according to the means adopted for their propulsion, to wit—petroleum, steam, and electricity. Undoubtedly the largest medium of success has been achieved by petroleum vehicles. Briefly petroleum cars may be treated under the following heads:—Motor-cycles, light voiturettes, light motor-cars for goods traffic, and those using the heavier or ordinary burning oils. Concerning motor-cycles, the position in England is a rapidly advancing one. In America their use is only just commencing, while in France and throughout the Continent many thousands will be found in use daily, and some idea may be gleaned of the extent of the industry on the Continent, when I say that the firm of De Dion and Bouton alone received orders last year for over 14,000 motors for use on cycles. For the most part they take the form of the ordinary pedal-propelled tricycle, but carry behind the rear axle a small motor fitted with radiating flanges around the cylinder for the purpose of cooling it. Great advance has been made in motor-cycles in the power of the engines supplied, some having gone as high as three and a-half horse-power, and even higher, but the largest size which has proved really satisfactory, and which is largely used, gives a brake horse-power of two and a-quarter. In addition to tricycles carrying one rider only, further satisfactory machines are built for two riders with four wheels, these quadricycles carrying their riders tandem fashion and being built throughout on cycle lines. Another means of carrying an additional rider or riders is found in the attachment to the rear of a tricycle of a light frame running upon two wheels and carrying a seat. Two passengers can be taken here, and it is astonishing what results can be obtained over an ordinary country in this way if the gearing speed of the drawing tricycle is kept down.

But the ideas of the public incline to something more stable than the tricycle and something more sociable than the tandem, and probably the greatest demand to-day, both in this country and on the Continent, is for a light two-seated sociable vehicle; the equivalent, if I may so liken it, to the pony and trap of the horse-driving world. A great number of makers in France are using a small De Dion motor as used upon cycles for the propulsion of small cycle-built carriages, though most of them are very crude in their construction, and not altogether satisfactory in their results. Between this type and the larger cars there are quite a large range of varieties in gradually increasing steps or stages. In England, as in France, many firms are copying the carriages of Benz and Co., of Mannheim. This is, perhaps, one of the simplest forms of motor cars on the market, and a very large number of them are already in use. But we are not confined in this country to the copies of the foreign article, and already a considerable amount of originality in ideas has made itself manifest. Thus, Aeclis, at Perry Barr, is building a neat little vehicle possessing several original ideas. Mr. J. S. Critchley, of Coventry, has produced a light and speedy car.

Perhaps the most original car which has yet made its appearance in England is the invention of a Birmingham man, Mr. F. W. Lanchester, whose car is fitted with entirely original mechanism in almost every particular. With a two-cylinder engine and use of air fans throwing a steady current of cold air upon the flanged cylinders, he is able to do without a water jacket, with a 7 h.p. engine, and by a very clever arrangement of the pistons in connection with a double fly-wheel, by which the fly-wheels are caused to revolve in opposite directions, and the thrust of the pistons divided, and the line of force so made absolutely central. In its effect upon the car an almost entire absence of vibration due to the running of the engine is secured. This and many other details make the Lanchester car a very attractive, and certainly a most comfortable vehicle. Another Birmingham firm also, the Wolseley S.S. Machine Company, have recently produced a substantial and very practical two-seated car. None of the vehicles I have mentioned, however, quite come up to the pony-trap idea which I mentioned just now, though several firms are, I believe, experimenting in this direction. Perhaps the most notable of these is Burford, Van Toll and Co., of Twickenham, who are constructing a copy of the "Vivinus," a little car of Belgian design, using an air-cooled motor on somewhat novel lines and with belt gearing and very simple two-speed gear, the car being small and light. I have myself, too, recently designed a car of this description, the first one of which is now in course of construction. The back frame is rigid, with a live or central geared axle and supported on springs in front. This frame carries all the mechanism. A motor—in this case a De Dion—is fitted to the front supported upon springs, and so placed as to get the full benefit of the air contact. The motor is geared to a countershaft, which is connected with it by a clutch gear worked from a foot lever which first throws back the sparking, then throws out the clutch, and then applies the brake. The countershaft carries a three-speed gear, and from that a single central chain carries the power back to the driving axle. The seat is supported upon a second frame—a simple loop—hinged to the first one at the back of the splash guard and supported at the rear by springs, this secondary frame having only to perform the duty of carrying the body and load and being entirely independent of any of the mechanical connections.

In America perhaps more attention has been given to this light class of vehicle than to any other so far as those machines propelled by petroleum are concerned. The carriage built by the Winton Company, in Cleveland, somewhat follows the lines of the Benz, but embodies many special features of its own. The "Columbia" car, built by the successors of the Pope Manufacturing Company, possesses many of the features of the best French vehicles. The Duryea, made "out West," in Peoria, Illinois, a machine of very simple construction, uses an engine having three parallel cylinders working on cranks set at 120 deg., fitted with a very simple two-speed and reversing gear. Mr. Duryea, the inventor, has had a great experience in motor-vehicles, and his first machine, so far back as the memorable drive to Brighton in 1896, easily distanced all the best and latest French racing cars of that date. The style of the construction of most of the American vehicles follows that known to the carriage trade in that country as the "Run-about."

The larger types of cars may chiefly be exemplified by what are known as Panhard and Daimler. These have been from the start more or less practical, and the firm of Panhard and Levassor, of Paris, have really the credit of founding the motor-car industry, and at the present time have orders to the value of over three quarters of a million in hand, which will keep them fully occupied for the next two years. The English Daimler Company work upon the same lines, and most will remember the somewhat ungainly patterns of the earlier machines of this company. Even these, however, were practical and useful vehicles capable of good work. Since that time great advances have been made, and between the Daimler Company and the Motor Manufacturing Company between 500 and 600 cars have been produced.

Needless to say there is great competition amongst French makers in big races, and appearance is sacrificed to efficiency in

the car, which is all engine and works. In order to reduce the enormous windage induced when travelling at these high speeds, many curious devices are adopted.

So far as America is concerned very little has been done in the way of large petroleum vehicles, though the Winton before-mentioned, and another very practical vehicle built by Haynes and Apperson, of Kokomo, Indiana, are almost as large as these French machines. A leading feature about the American machines may be noted, and that is, that whereas in France a wheel and gearing is used to steer, which system is rapidly coming into favour in this country, in America a hinged lever is universal, and whilst Europeans use a differential geared countershaft and drive with two chains, two driving wheels which run loose upon a fixed axle, the Americans almost universally use a live axle with central drive, and do away with chains as much as possible.

So far I have only spoken of cars used for passenger conveyance, but some attention is being given to vehicles for goods delivery. Up to the present most of this class of trade has been left to the makers of steam-cars, but Messrs. Benz and Co. supply a neat delivery wagon, which is the same as their passenger vehicle, save for the style of the body, which will carry loads up to half a ton. The Daimler Company, the Motor Manufacturing Company, and Messrs. Panhard and Levassor in Paris have also made a number of highly satisfactory wagons carrying goods up to 20 cwt. A few have been made of larger dimensions, but the 20 cwt. car is the most satisfactory. The makers of the Daimler in Germany, however, have far exceeded this, and have produced

two very satisfactory types of heavy wagons, one with 10 h.p. motor, carrying loads up to as much as 5 tons, at an average pace of between four and five miles an hour.

Many efforts have been made to produce a satisfactory vehicle which shall use the heavier, cheaper, and safer oil instead of the spirit. Roots and Venables in this country and Koch in France have both produced cars which give very passable results with this form of fuel. The chief objections to the use of heavy-oil is, however, the difficulty of starting, as the oil has first to be vapourised by heat applied externally, and this takes on an average about ten minutes. In addition to this, the smell, especially before the engine has got properly hot, is considerable, and as a rule the motor requires a larger amount of cleaning and general attention owing to the unconsumed residuals left behind as the products of combustion, so that in spite of the undoubted advantages in point of cheapness, in working and greater safety from fire, with the greater readiness with which a suitable oil can be obtained, they have not made any great progress, and undoubtedly a large field for experiments exists in this direction.

Passing from oil to steam. This is a power which, owing to the universal knowledge of its capabilities and the great experience which English people have had of its uses, the British public naturally first turns to as the particular power which appeals to it as best adaptable for automobile vehicles. No one, however, knows the difficulties of this so well as those actually engaged in the manufacture of steam outfits, and in England this power has practically been relegated entirely to the requirements of the heavier types of vehicles for the conveyance of heavy goods and large passenger loads. Mr Carr, of Carlisle, some three years ago built a steam-tricycle on the lines of the Bollée, with which he carried out a successful tour in the Highlands, and one or two other amateurs have produced specimens of steam cars, of which we have, however, hitherto heard nothing commercially. But the matter has been by no means dropped by English investigators, and Mr. Gooch, of Brighton, will be running an English steam carriage of new design in the 1,000-miles tour. I am also hopeful that I, too, may be driving in that tour another new vehicle propelled by steam, in the construction of which I am at present engaged in conjunction with Messrs. Makins,

Limited, of Manchester. As the car drawings were only completed a week ago there is some probability that it may not be ready in time, but as the car itself is exceedingly simple in design, and as the boiler and engine, which are the most important parts, are partly built, we are hoping for success. This car will embody several new features. In the first place, it will obtain steam from a boiler invented by Mr. J. G. A. Kitchin, of Manchester; it is on the same principle as that of Serpollet, though weighing but 40lbs. as

THE TOURAND MOTOR-CAR. (For description, see page 25.)

Cliché de

(La France Automobile.

against Serpollet's 400lbs., the water and oil tanks, boiler, and condensers all being arranged in front of the dashboard, so that no one will sit over the boiler, as is the case with most other steam cars, and with all the Americans. In the boiler and condensers the system of the cone which provides the greatest amount of effective atmospheric surface is used, and it is hoped that the entirely novel condensers will condense all the steam used. The engine, too, possesses several new features. It consists of three high pressure cylinders 2½ in. bore by 4 in. stroke, with a rotary slide valve and a crank shaft set at 120 deg., and the engine which, it is anticipated, when forced will develop 10 h.p., weighs but 82lbs.

In the design of the new car I am adopting a principle in which I think other cars would be improved, that is to say the use of a long wheel base; thus with four 30 in. wheels I shall have a wheel base of 7 ft. as against 5 ft. 6 in. on the Daimler cars, and I fancy I shall get greater comfort and greater steadiness of running. When I add that the boiler is fired with ordinary kerosene, it will be seen that there are many points of interest in the new vehicle.

In France, too, little attention has been given to steam. Serpollet has certainly produced a boiler, which for the uses of the motor-car possesses a great many advantages, though these are almost entirely discounted by the drawback of excessive weight. Serpollet is meeting with success with his system in the construction of tram-cars, and he has recently produced a light passenger vehicle, but the utmost he has been able to do is to reduce the weight to 1,500 lbs. with a 400 lb. boiler. The Americans, on the other hand, have taken hold of the light steam pleasure carriage in a thoroughly American way, and have undoubtedly produced vehicles of this type far and away in advance of anything which Europe has yet commercially seen. They have taken the cycle as their model for car construction, and whilst using oil, or rather petroleum spirit—stove gasoline—as the fuel, they have reduced their boiler capacity to the smallest dimensions, using boilers of the fire-tube variety, in which the heat passing up through from three to five hundred half-inch tubes, quickly raises steam from the water surrounding them, and with a light seating arrangement for two persons produce a complete carriage weighing under 500 lbs.

So far as the heavier types of steam vehicle are concerned England is undoubtedly a long way ahead of all her competitors. In France, with the exception of a somewhat complicated and very heavy carriage built by De Dion, and what is termed a "road train" by Scotte, little or nothing has been done. So far as I am aware, in the United States no effort has yet been made—at any rate, none successfully—to produce a wagon of this character, but the matter has received attention in England from some of our leading engineering houses, who have achieved distinctly successful results.

So far as electrical cars are concerned there can be no doubt that the electrical vehicle is *par excellence* the ideal carriage, especially for pleasure purposes. Its drawback will be found in the comparatively short distances to which its journeys are limited, the time necessary to recharge its accumulators, and the expense of renewal of these. However, as might not unnaturally be expected, America here undoubtedly leads. England has done but little in the construction of the electrical vehicle, although it was the first country to introduce a regular service of electrical carriages. Mr. Opperman in the way of private carriages has produced some practical vehicles, and one or two others have dabbled with them in a more or less experimental fashion. France, likewise, has given but little attention to the electrical vehicle, at any rate so far as the ordinary pleasure carriage or delivery wagon are concerned. Although Paris has recently made fresh efforts to utilise the electric cab, built on much the same lines as the London vehicle, it yet remains to be seen whether any greater success will be attained. America, however, has given her attention to the production of commercial electric vehicles with assiduity and success. The simplest form of electric carriage made there—and this is done by numerous makers—consists in taking an ordinary American buggy, putting accumulators in the body, a couple of motors on the wheels, and fitting a steering arrangement to the front. Other firms, however, have done the thing more thoroughly, and some specially designed vehicles of very high merit have been introduced, whilst in New York and most of the principle Eastern cities electric cab companies have been established, with a specially-designed vehicle totally different from the English style, looking more like a very clumsy and heavy hansom cab without the horse.

Broadly speaking, it will be seen from the above that, whilst America undoubtedly leads in the electrical vehicle and at present also in the light steam pleasure carriage, England is positively in front, and a long way in front, in connection with steam wagons for the conveyance of heavy goods, and is making good headway with petroleum vehicles, whilst France in the latter class of car undoubtedly leads the world. I think, however, I can safely say, that before five years are out, England and America will be in the lead. I think it most probable that in steam carriages of all classes, the English makers will eventually be in front, whilst in petroleum vehicles they will at least equal the French, and America will probably retain its lead in electric matters. To the people who are continually saying "Where are the motor-cars—for we never see them?" it may be instructive to

say that a careful estimate taken recently showed that during the year 1899, an aggregate of about 2,000 self-propelled vehicles of all kinds have been made in or imported into and sold in England, this number being about equally divided between cars and motor-cycles. That the automobile has "come to stay," I think no one—at any rate no member of this Club—will now doubt, and as we get more accustomed to their appearance and behaviour, most of our preconceived prejudices must disappear.

An interesting discussion, in which Mr. W. Worby Beaumont, Mr. Shrapnell Smith, Mr. R. W. Buttemer and Mr. J. J. Mann took part, followed the reading of the paper.

A MEETING of automobiles at the Pan-American exhibition to be held at Buffalo next year has been suggested.

A NEW West Virginia corporation is the American Vehicle Company, with a capital of £200,000, to utilize compressed air as a motive power for vehicles.

A NEW corporation under Virginia laws is the Autocarette Company with a capital of £40,000, organised to build and operate motor vehicles in Washington, U.S.A.

THE Automobile Street Sweeping Company is the title of a company which has just been formed in Boston, Mass, with a capital of £600,000, to manufacture and deal in vehicles, automobiles, etc.

THE C. H. Black Manufacturing Company of Indianapolis, Ind., U.S.A., have sent us a copy of their automobile catalogue, which includes light two-seated cars, wagonettes, small delivery vans, etc. The vehicles appear to follow Benz lines throughout.

WE learn that Mr. H. F. Mulliner has acquired the London business of Messrs. Mulliner, Limited, at 28, Brook Street, W., and that he will in future confine his attention to the construction of automobile bodies, of which this firm have made a speciality. Arrangements are also in hand for the storage of motor-cars for those *chauffeurs* who have not the necessary accommodation.

THE United Motor Industries, of 64, Holborn Viaduct, E.C., have sent us a sample of their "D" lubricating oil, which has been specially prepared for De Dion and other small high-speed engines. In addition to being in itself a very good lubricant for such engines, a thick oil tends to keep the compression better, a no small matter in itself. Another advantage claimed for this oil is that it does not from the effect of great heat assume a liquid form as is the case with many oils, there being consequently much less liability for the oil to penetrate to parts of the motor where it is not required and where its presence is injurious. We understand that Messrs. De Dion, Bouton, and Co. have decided to use this oil exclusively in their motors.

THE Quick Manufacturing Company, of Paterson, N.J., U.S.A., have sent us particulars of a petrol motor they have lately introduced for automobile purposes. It is a four-cycle horizontal engine with two cylinders. The crank shaft is in one piece of open hearth forged steel. The connecting rods are of malleable iron, with bronze bushings. The pistons are cast-iron, with packing rings and wrist pin of hardened steel. Electric ignition is used. The valves are operated from a shaft across the cylinder ends driven by chain from sprocket wheel on crank shaft. All bearings are fitted with bronze bushings. The motor is 27½ in. long, 18 in. wide, and 14 in. high: it weighs 249 lbs., and at a normal speed of 700 revolutions per minute will develop 4 h.p.

AN American writer remarks that "The development of the electrical industry has been the wonder of the past few years, and it now appears as if the automobile industry would see a like increase in volume in the immediate future. At present there are hundreds of automobiles of every conceivable pattern, from the motor-bicycle to the heavy dray, in operation in the city of New York alone—and the number thus operated is constantly increasing. Already the large department stores are arranging to deliver their goods by automobiles instead of with the usual horse-drawn vehicle, and the undertaking seems to be a success. In fact, the automobile is well received wherever it appears, and lends itself very readily to the conditions of practice."

THE CANELLO-DURKOPP MOTOR-CARRIAGES.

WE have already (see issue of February 23rd last) published particulars of several of the details of the motor-vehicles of the Société des Automobiles Canello-Durkopp, of Courbevoie, France. We are now able to complete the information then given by detail illustrations of the variable speed gear and steering mechanism. A section of the variable gear is given in Fig. 2, in which *N* is the motor shaft extending from the friction clutch, which may be imagined to be at the left. Upon this shaft are the gears *G*, *H*, *I*, *J*, and *J*. Upon a parallel shaft,

FIG. 1.—VIEW OF CANELLO-DURKOPP SPORTING CAR.

A, situated above *N* and in the same plane, are the corresponding gear wheels running loose, engaging with those below of the same denomination, so that *H* gives the first speed, *I* the second, *J* the third, and *J* *Y* the fourth. It will be noticed that *G* does not engage with the pinion *G* *H*, but is commanded by an intermediate pinion not represented in the illustration, which gives the reverse motion. All the gear wheels on the shaft *N* and *A* are constantly in mesh and are enclosed in an oil-containing case. In order that the car may be driven at a certain speed, it is sufficient to make one of the upper row of gear wheels rigid with the shaft *A*. This is done by the inner eccentric joined with the sleeve *B*, which moves along the shaft *A* under the action of a fork working in the collar *K*, this fork being

FIG. 2.—SECTIONAL VIEW OF VARIABLE-SPEED GEAR.

controlled by the lever at the side of the driver. If then, by means of this lever, the sleeve *B* is moved so as to make rigid connection between the wheel *G* and the shaft *G* *A*, the pinion *G* *H* will set *G* in motion through the intermediate pinion (not represented) and a reverse motion will be obtained. If the eccentric comes to the right of *H* the pinion *G* *H* will set in motion the pinion *H*, with which it is always in engagement, *H* will turn *A*, giving the first speed, and so on. The speeds provided for are 5, 9, 12, and 21 miles an hour, with a slow reverse motion. The shaft *A* terminates in the pinion *C* of the differential *D*, which is located centrally of the countershaft carrying the chain pinions. Moreover, *P* is an arm, with lever operating the rod *O*, which draws the male portion of the friction clutch away from the fly wheel and thus disconnects the motor, the arm and levers *P* being operated by a foot pedal and the brake levers. One of the

most interesting parts of the Canello-Durkopp cars is the steering mechanism. The front wheels are pivoted, as usual, and are controlled by a sloping hand-wheel and sector or bar, as desired, but with the interposition of a screw whose object is to relieve the rod of the shocks caused by the inequalities of the road traversed. The rod *A*, Fig. 3, commands the sector *F*, gearing with the pinion *E*, forming part of the screw *G*. Along *G* rises and falls the nut *H* supported by the lever *K*, attached by the arm *M* to the steering head *N*, commanding the front wheels. The

FIG. 3.—DETAILS OF STEERING GEAR.

joints *P* and *R*, at the extremities of the arm *M*, are pivoted, relieving the shocks of the wheels. If one of the wheels encounters an obstacle, the screw *G* prevents the lever *K* from communicating the shock to the steering handle. The pinion *E* will rise and fall in the teeth of the sector *F*, but will not unmesh. For the same reason the wheels will, it is claimed, never deviate so much that the rod will not displace the sector *F*, thus permitting the hand to be temporarily removed from the steering wheel or lever without fear of accident. Fig. 1 illustrates a Canello-Durkopp two-seater racing car of which the body is largely constructed of aluminium.

FURIOUS DRIVING CASE.

IN Edinburgh Police Court last week James Gillon (19), motor-car driver, denied a charge of having driven a motor car in Princes Street in a reckless and careless manner, whereby he came in contact with another motor-car, and caused £2 damage. Accused was driving eastwards behind a cable car, which stood when near Castle Street, and he suddenly took to the right or offside, and, shooting from behind the cable car, ran into another motor-car coming from the opposite direction. The Sheriff found the charge proven, and said that what accused had done was exactly the thing done frequently by motor-car drivers, and exactly the thing that they should not do. He imposed a fine of £1, or seven days.

THE MOTOR MANUFACTURING COMPANY.

AN extraordinary general meeting of the Motor Manufacturing Company, Limited, was held at Winchester House, E.C., on Tuesday. Mr. John H. Gretton (the chairman), who presided, said he would at once proceed to lay before the meeting the reasons which had induced the committee and the board to place before the shareholders the resolutions of which notice had been given. At the last meeting he stated that the company could not carry on the business upon the present basis without further capital, and that unless they obtained further capital they would have to wind up the company and sell what they possessed.

If this concern were broken up and sold for what it was worth, he very much doubted if, after paying their liabilities, they would realise more than 1s. 6d. per share. Then they had carefully considered whether they could raise the required capital by any other means. They soon came to the conclusion that it would be very difficult, if not impossible, to obtain money upon debentures; and, further, that if even they succeeded in issuing preference shares they would have to give such advantages to such shares that they would make the interests of the other shareholders so deferred that they would not be worth having. They then put to themselves the question, "Is this business in a condition that justifies us in supporting it with a little more money?" He and his colleagues did their best to show the members of the committee what the nature of the business was at the present time. He wished now to contrast the position that the business occupied at the present time with its position when the company was formed. At the time of the formation of the company they had practically no business established, and they had to start one. To-day they were doing a large trade. Within the last fortnight or three weeks they had taken orders for cars to the amount of nearly £7,000, and this, he would remind them, was not the best season of the year. Then with regard to the works. At the present time they had a factory which, from the point of view of efficiency, would turn out all the work they wanted to do. It would, of course, be an advantage to add somewhat to the factory for the purpose of increasing the output. The directors therefore considered they were justified in advising the shareholders to put more money into it. No one could doubt that the motor vehicle industry was bound to be a very large industry. It was not like a business that had arrived at its full development; but it was on the up-grade, and therefore a business which business men might well consider it would be a good thing to put money into. He was glad to say the proposal now submitted had received a good deal of support; for the directors had received nearly 600 proxies in its favour. Having urged shareholders to do their best to extend the business of the company, by recommending its vehicles to their friends, the chairman proceeded to say that when it had been reconstructed this company would be the leading manufacturing company in the country for motor-vehicles. They would have an established business and sufficient working capital for all purposes; in fact, the capital which they would have at their command, but which would not be called up unless it were actually required, would place them in a very powerful position.

They were prepared to supply a 3 or 3½ h.p. De Dion motor with water jacket, which was thoroughly equal, if not superior, to anything they could get from France, and they were prepared to sell it, if not at a less price, certainly at the same price. They were convinced that if they produced these motors in large quantities they could sell them at the same price as they were sold at on the other side of the water, or even cheaper. Then there was a criticism about the Iden patents, and it was asked why they should bother about them when there were other systems that were well known and accepted. Well, they had the monopoly of the Iden patents, and under them they could manufacture a two-seated car which they could sell at about 220 guineas, but in France they would not, or did not, supply a similar vehicle at that price. Under the Iden patents they had a 10 h.p. char-à-banc or wagonette, which would carry up to 20 people. They called this a 10 h.p. carriage; but it really developed up to 13 h.p. There was no such carriage produced in France under any of the established systems. This company could sell that car for £650 and make a profit for the shareholders, whereas in France they would charge at least £1,200 for such a car. The directors considered their endeavours ought to be to produce on a large scale and on an economical basis in order to be able to meet a large demand. They did not want simply to cater for those who could afford the luxury of a very smart motor-carriage; they wanted rather to provide for the public service, and to get people to give them orders for six or twelve cars at a time. They were arranging their workshops accordingly, and would be able to turn out these cars at the lowest possible prices. The chairman concluded by moving the resolutions of which notice had been given, remarking that he felt sure that if the shareholders followed the advice given them in regard to the matter they would find they had done the right thing, and that the business would become prosperous.

Mr. J. Glass (chairman of the committee) seconded the resolutions. He was satisfied that the business was a good one, and that it was worth finding more capital for. If, however, they went into liquidation the bulk of the business would go abroad.

Mr. Tinne said he considered the present directors had done a great deal in getting rid of old incubuses and putting the company in a better position, and he thought that if the company were reconstructed it would do a fairly prosperous business. He had no hesitation whatever in putting more money into the concern. There were, however, two questions which he wished to put: First, what would become of the £18,000 standing to the debit of profit and loss accounts when the company was reconstructed? and, secondly, what amount of profit would the company require to make in order to justify it in paying a dividend, bearing in mind the fact that the patents had only about ten years to run, and that the £200,000 appearing under that head in the accounts would have to be written off during that period?

The Chairman, in reply, said it was proposed that the secretary should act as liquidator, and therefore the usual expenses incidental to reconstruction would be greatly reduced. It was with great reluctance that they had come to the decision that additional capital was required; but, as practical business men, they were bound to face the position. With regard to the question raised about wiping off the value of the patents, he would point out that as they went on they formed a business, and when a company's patents had expired it was very often found that

it had built up a goodwill which was equal in value to the figure at which the patents stood. It was hoped, therefore, that there would be no necessity in the case of this company to write off any such amount as had been referred to. The interest of any shareholders who dissented from the reconstruction scheme would be disposed of by the liquidator for what it would fetch, and as regarded those who were in arrear at the present time, they would have to pay up their calls before they could exercise any right respecting the new company. The balance to the debit of profit and loss accounts would, of course, be extinguished under the reconstruction; in fact, one of their very objects was to start with a clean slate, and not to be associated with the faults of those who had preceded them. In his opinion the reconstruction would be a financial advantage to the shareholders. He believed the market price would increase to a much larger extent than the amount of money they were asked to subscribe.

After some further discussion, the resolutions were put and carried unanimously. The Chairman then moved that the committee of conference remain as a consultative committee to consider, with the board of directors, the arrangements for administration in connection with the new company. Mr. Hoffmann seconded the motion, which was agreed to, and a vote of thanks to and confidence in the chairman and directors closed the proceedings.

THE LONDON MOTOR-VAN AND WAGON COMPANY.

—8—

THE ordinary general meeting of this company was held in London on Monday. Mr. Sidney St. J. Steadman, who presided, formally moved the adoption of the report, remarking that he was prepared to answer any questions relating to the accounts. Mr. D. E. Cardinal seconded the motion. Mr. Worthington referred to the statement in the auditors' certificate that "no depreciation has been charged on stock of vehicles and motors," and inquired what the position would have been had such provision been made. The Chairman said that he did not know whether a single director would be justified in answering such a question without consultation with his colleagues. Speaking solely for himself, however, he thought that the depreciation for the past three and a-half years would be fairly represented by £800. Mr. Worthington asked what portion of that sum appertained to the accounts submitted, which showed an apparent profit of £392. The Chairman:—£250 at the most. Mr. G. H. Sprules remarked that £24,000 of capital had been received from the shareholders. Was the difference between that amount and the figure at which the stock stood, together with cash in hand, the extent of the company's losses? The Chairman replied that all the assets were set out in the balance-sheet. He could not answer the question in the form in which it was put. Another shareholder reminded the meeting that £12,000 had been paid in cash to the vendors. The motion was agreed to. An extraordinary general meeting was afterwards held to consider resolutions for the voluntary liquidation of the company, with a view to reconstruction. The secretary (Mr. W. M. Hodges) read the agreement embodying the scheme. It provided for the formation of a new company, the London Motor Company, Limited, to take over the general assets of the existing company. Each shareholder, with the exception of the holders of vendors' shares, was to be entitled, in respect of every fully-paid £5 share, to claim an allotment of four shares of 10s. each in the new company, with the sum of 7s. per share credited as paid up, leaving a liability of 3s. per share. The Chairman, in moving resolutions in accordance with the object of the meeting, mentioned that the circumstances rendering reconstruction necessary had been explained in a circular to the shareholders. All the old members of the board supported the scheme, and had agreed to their deferred or vendors' shares being extinguished for the benefit of the cash shareholders. The same observation applied to a considerable number of other gentlemen who held vendors' shares. Should 1,000 of those shares remain outstanding, the agreement would not be carried out, and the directors would communicate with a committee of the cash shareholders with a view to presenting a petition for compulsorily winding up the company. Absolute refusal to allow the vendors' shares to be extinguished had been received from only one holder. Mr. Cardinal seconded the resolutions. Mr. Worthington inquired what the position would be if any shareholders declined to pay the 3s. liability on the shares in the new company. The Chairman replied that the practical effect would be that the shares of any such person would be forfeited. A shareholder, referring to the provision that this company should surrender the licence granted by the British Motor Company, under conditions set out in the agreement, inquired if the new company would have to pay any royalty to the British Motor Company. The Chairman replied that they would have to do so only in the event of their using a motor which infringed any of the British Motor Company's patents. They would have to pay 5 per cent. royalty in case of infringement. Mr. Samuel said that his client, Mrs. Leach, was a cash shareholder to the extent of £2,000. The agreement which had been read was rather complicated, and he doubted whether those who had heard it for the first time fully understood its provisions. He suggested, therefore, that the meeting should be adjourned and the agreement printed and sent to the shareholders. Mrs. Leach moved and Mr. Worthington seconded an amendment to that effect. The Chairman took a show of hands and declared the amendment lost. Mr. Dangerfield pointed out that if the company were placed in permanent liquidation the assets would not realise a sum sufficient to return more than about 1s. a share on all the existing shares. In the new company the assets would cover the whole of the liabilities, including the cash capital. After further discussion the resolutions were declared carried.

COMMENTS.

seated Benz car by Mrs. Bazalgette. On another page we print an outline map, showing the principal towns to be passed through during the course of the forthcoming event, and giving also the distances between the same.

Police Authorities and Provincial Surveyors Assisting.

THE chief constable of every county through which the route of the Trial passes has had all the particulars of the contest laid before him, and has been asked for his co-operation. The replies received are of the most satisfactory character, the police force throughout the kingdom showing a disposition to do all in its power to make the Trial a success, provided the drivers of the vehicles will moderate speed in towns and villages, and will show consideration towards other users of the highway. The one exception is the Chief Constable for Lincolnshire, who has given orders to the police under his control to take particular precautions to prevent any vehicle travelling in Lincolnshire above the speed permitted by the Local Government Board regulations. The portion of the route controlled by the Chief Constable for Lincolnshire is from Dunham Bridge to Lincoln and from Lincoln almost as far as Newark. A letter has also been sent by the club to the surveyor of every county and the borough surveyors through which the route passes expressing the hope that, in the interests of the motor industry, they may see their way to give instructions that any stones which it may be necessary to put down may only be laid over a portion of the width of the roads in question at the time of the trial. A large number of replies have been received, and in almost every case they express a great anxiety to secure that the roads over which they have control shall be in good condition. In some cases in which they had intended repairing the roads at the time of the trial, they have either issued instructions for the work not to be done until later, or for the stones to be laid down at once, and state that the stones will be well rolled in before the date of the trial.

The Speed of Motor-Vehicles.

THE essay by "Precursor" on the speed of motor-vehicles published in our last issue has brought forth a long letter on the subject from a correspondent, in which some new ideas on the subject of the restrictions in the speed of motor-vehicles on roads are brought forward. We fear it will be a long time ere we are able to induce the local authorities throughout

the country, many of whom have so far shown themselves anything but friendly to the automobile, to view the matter in the same light. Unfortunately, too, there have been cases of automobilists who have done considerable harm to the movement by their actions, who have thought themselves "entitled to drive at the legal twelve miles an hour through a crowded street." The points raised by our correspondent are, however, interesting, and we should be glad to have the opinions of our readers on the subject.

A Race from Dieppe to Rouen and back for British "Chauffeurs."

WE learn from Mr. J. S. Harvey that he has been able to arrange a handicap race over excellent roads for English *chauffeurs*, in connection with the International Automobile Festival, which is to be held at Dieppe on June 17, 18, and 19. The race will be held on Monday, 19th June, from Dieppe *via* Rouen and Beauvais, and back to Dieppe; it will be open only to English drivers registered at the Automobile Club of Great Britain and Ireland. In order to secure the establishment of this interesting event, Mr. Harvey has pledged himself to obtain a minimum of fifteen entries. The distance is, roughly, 225 kilometres, over excellent roads.

Motor-Cars in the Colonies.

SEEING that British makers are acknowledged to be ahead of those of other countries, so far as motor-vehicles for heavy traffic are concerned, it is gratifying to observe signs that some of our Colonies are about to experiment with a view to their adoption. The road authorities of the Straits Settlements have decided to purchase a motor-vehicle for the transport of stone, granite, and other road materials. During recent years there has been an increasing drain upon the bullocks of the colony, and last year there was an outbreak of rinderpest, which threatened at one time to stop the scavenging of some of the main thoroughfares. Having heard of the progress made in connection with motor-vans for municipal purposes in England the authorities have decided to purchase one by way of experiment. Such enterprise is worthy of imitation by British municipalities generally.

Tests for Automobilists.

HOLDERS of licenses to drive automobiles in the United States must have many qualifications, and in Chicago capacity to drive is supplemented by some exacting requirements as to the physical capabilities. Among other things, applicants must have good use of both hands and arms; also both legs and feet. They must be able to pass a satisfactory test for colour blindness, have good hearing and be free from epilepsy. The suggestion that a motor-car driver should be an expert in the use of both legs and feet is probably due to a fear on the part of the local authorities that he may fall off his car. In such a situation it would, of course, be desirable he should alight on his feet and not under the vehicle.

The Demand for Greater Speed.

Two resolutions of interest to automobilists have been before the Associated Chambers of Commerce at their annual meeting. The first urged the Board of Trade to enforce the marking of all foreign-made carriages imported into this country for sale, and after some discussion was withdrawn. The second was of more particular interest and importance, a motion, proposed by Mr. Plummer, of Newcastle-on-Tyne, being carried, urging the desirability, for the purpose of securing the full advantages obtainable from vehicles propelled by mechanical power on highways, of revising the present regulations which limit the speed of such vehicles, and agreeing to memorialise the President of the Local Government Board on the subject. Last week we published the views of a religious newspaper on the subject of the speed of motor-cars, and now that the commercial men of the country are moving in a similar direction it would seem that the motorists will either be left behind or have to quicken their speed at the bidding of others. It certainly is an interesting position, for while the Automobile Club is issuing warnings against those who exceed the legal limit—once facetiously described as the distance beyond reach of the police—outsiders are attempting to secure privileges and concessions which automobilists hardly dare urge on their own behalf—for which attention they should be thankful.

A Coming Race Meeting in the Midlands.

AN International cycle tournament is being organised by our Midland contemporary, *Bicycling News*, to be held at Aston Villa ground, near Birmingham, on Easter Tuesday and Wednesday, April 17 and 18. The programme for the first day includes a ten-mile motor quadricycle match between S. F. Edge and another, and J. W. Stocks and another; a one-mile motor-tricycle handicap; a five miles ditto; and a ten-miles motor-tricycle scratch race. On Wednesday the events to be run off are:—A one-hour motor-tricycle match between S. F. Edge and J. W. Stocks; a one-mile motor-tricycle handicap, a five-miles ditto; and a ten miles motor-tricycle scratch race. Entries for the races will be received until Saturday, April 7th. We understand that a special feature of the races will be that all competitors will start from given distances behind the scratch mark—in the handicaps, of course, these distances will vary according to the start. Up to the scratch mark the motorists will be permitted to pedal, but beyond the machines will have to travel entirely unaided, any infringement of this rule being attended with disqualification.

Touring in France.

THE recently-formed Touring Committee of the Automobile Club of France has quickly got to work, and has already issued particulars of the first two events specially organised for the participation of touring automobilists. The first of these is fixed to take place on Sunday next, the 25th inst., and will consist of a drive from Paris to Robinson and back, the route to be followed being by way of Suresnes, Ville-d'Avray, Versailles, Chatenay, and Sceaux. The start will be effected from the club at 9 a.m., and lunch will be partaken of at Robinson. On the following Sunday week, April 8th, a paper-chase will take place in the forest of Saint-Germain, the start being made from Chatou at 8.30 a.m., and the arrival fixed at a spot on the magnificent terrace of Saint-Germain. The committee has very wisely abstained from formulating a mass of regulations, but it prohibits the participators in club excursions to pass one another while descending hills, a ruling which cannot be too highly commended. The committee proposes to establish an office in the club where automobilists will be able to find all details pertaining to touring, and so enable them to plan their excursions with the minimum of trouble. Very probably, too, touring competitions will be organised, that is to say, competitions of endurance, which to the ordinary automobilists are of infinitely more importance than all the races in the world. It is evident that this new committee,

of which the Comte de la Vaulx is the president, will do much good work both for Automobilism and for the Club.

A Wail from Cheshire.

A SPECIAL correspondent of the *Cheshire Observer* has written a long tirade against "such dangerous vehicles" as motor-cars. According to this wise person whose lugubrious remonstrances find prominence in our contemporary, light locomotives have "introduced a new danger on these already crowded thoroughfares, the country roads." And then he proceeds to enlighten his readers with the case of Mr. Gretton and Mrs. Hanbury as lately heard in the Law Courts. If innovations are to be prohibited because they are not quite so tame as our normal ideas, invention may as well stop and Noah's Ark be substituted for ocean greyhounds. When old travellers first saw the locomotive and when the field labourers saw the bicycle they were scared. So must the early inhabitants of the earth have been terrified when bullocks were yoked to carts for the first time. Every useful advance has alarmed somebody or other, and we can only hope the Special Correspondent of the *Cheshire Observer* will soon resume his equanimity.

Automobile Ambulances.

THE fact that a New York hospital has adopted an automobile ambulance is regarded by an American contemporary as "another proof that in humane tendencies our people lead the world." Not only is that declaration proudly, if not modestly, made, but London is held up to scorn, and a picture drawn of the victim of a street accident in "that boasted centre of civilisation" being at the mercy of a gaping crowd until a London "four-wheeler" is requisitioned to jolt the injured man or woman to the hospital. "Contrast such treatment as this," continues our humanitarian contemporary, "with that accorded to the patient who is overcome in the streets of our American city. The instant that an accident occurs a rush is made for the nearest ambulance call. The alarm reaches the hospital, and with unequalled celerity the horseless ambulance is on its way to the help of the sufferer. No horses to be hitched up; not a second's delay. The driver mounts to his place; the doctor swings up behind; a twist of the lever and the automobile ambulance passes through the hospital gates and speeds on its mission of mercy, with the warning bell heralding to the injured one the fact that help is coming by the quickest means that science has so far provided. The pneumatic tires of the automobile ambulance pass smoothly over the poorest paved street." Several hospitals in New York now possess motor-ambulances.

Wants Encouragement (I)

SINCE the modern movement towards automobilism developed inventors have devoted much thought to the perfection of mechanically-propelled vehicles. In addition to those who have the necessary skill and knowledge, many eccentric persons have endeavoured to become identified with the industry and in the following letter from an American contemporary, many readers will recognise a class of genius not wholly unknown in this country:—I have invented a machine that will drive any machine from a tennent toy to a train of cars, or the largest ocean vesail that eve sailed with out the aid of steam or lectricisity or any other power atatched it done by waits and leaver I yose a balansed leaver so you can run the largest machine on earth with your little finger it will run anything great or small moving or stationary it will run wagons on the road or cars on the track as you are fixed to doo anything I would like for yo to take a shair and doo the manufatering for I have no money to put through the patent office and get before the people it will aply to all kind of youse that any other power will thare is no power that will excell it in power or spead theare neave was a power that will sell qick on the marke it is worth millions the cost of manufatering is

nothing to what any other power costs you can throw 20 inches of with one finger now as you have for the machinery and tools to do any kind of work I think that you will be the very one to take hold of it I am so old and paralysed that I cannot do anything and I will give you a good show for that is enough in it for five hundred so that is no use of one man making a hog of himself I would like to put up a light road wagon that will run without steam I will send you a rough drawing of my power and if you have any idea taking hold of it please inform me at once and I will come down and help you through with it as it is too good to let die without giving it a trial I cannot do it for the want of money if it is possible for you to do so from yours respectfully.

The Exhaust Box in France.

THE crusade against those *chauffeurs*, who for racing purposes are in the habit of dispensing with their exhaust boxes, appears to be gaining ground, for the Special Committee of the Automobile Club of Nice, charged with the organization of this season's *courses*, have just recently published an excellent ruling on this point. Their decision is to the effect that in view of the intention of certain racers to suppress the exhaust box of their vehicle in automobile races, and in view of the seriousness of the inconvenience of this suppression which would injure the development of automobile road races, they have decided to prohibit the starting of any vehicle (car, voiturette, or cycle) of which the exhaust box or silencer has been suppressed or does not act in a normal manner. The committee expresses its intention of eliminating from the *courses* all those racers who do not conform to this decision. This is a very excellent regulation, for nothing does greater harm to the cause of automobilism than this suppression of exhaust boxes and silencers. It is bad enough in races, and unfortunately it does not end there, for the *coureurs*, more particularly the motor-cyclists, having dispensed with their exhaust box for a race, do not trouble to replace it, and make their pleasure or business runs on a machine resembling an infuriated Maxim gun. If the removal of exhaust boxes and silencers is absolutely prohibited in races then the racing *chauffeur* will be compelled to retain these parts of his engine, and will have no excuse for making his pleasure trips without them. At present, on such occasions as the recent voiturette race from Paris to Rouen and back, the gathering of motor-men who assemble to witness the start or finish of the *course* includes many well-known racing men the progress of whose vehicles through the crowd is marked by a perfectly deafening row, and one is not surprised that horses are terrorised at meeting such automobiles. It is to be sincerely hoped that other race promoters will follow the example set by the Automobile Club of Nice, and endeavour to put a stop to this evil.

Petrol-Motor Building in America.

IN regard to present tendencies among petrol motor-vehicle manufacturers in the United States, the general drift, remarks the *Horseless Age*, is toward variable speed motors of higher power, simplifying transmission and reducing weight to a minimum. "Many prefer the single-cylinder engine, arguing that the ignition and valve mechanism are simpler, and that, with proper construction, the vibration is little greater than in the two-cylinder balanced type. Several good makers, however, have adopted two or even three cylinders in higher horse-powers in order to lessen vibration and facilitate the cooling of the cylinders. Attempts to dispense with the water jacket altogether in carriage motors—as distinguished from tricycle motors—have so far proved unsuccessful, but the employment of condensers so placed as to be exposed to a constant current of air has greatly reduced the supply of cooling water carried. There is still a deplorable exaggeration of horse-powers on the part of some makers of limited mechanical experience, and a foolish tendency to strive for lightness at the expense of strength and durability. Horse-powers calculated theoretically in the shop at top speed do not materialise upon the road, and when to the shocks of the explosions are added the strains of the road, the necessity for

sturdy construction must be apparent even to the novice. Road vehicle service is the most exacting to which a motor may be put."

A Useful Work for Motor-Car Builders.

QUITE a number of new works on the subjects of the automobile and automobilism have made their appearance in France during the past year or so, and additions are constantly being made. The latest is the "*Manuel Théorique et Pratique de l'Automobile sur Route*," by Gerard Lavergne, Ingénieur Civil des Mines (Paris: Librairie Polytechnique Ch. Béranger). The first part of the work is devoted to a brief reference to the early history of the automobile, commencing with Cugnot's steam vehicle, and to a consideration of the different powers available—steam, petroleum, and electricity—for the propulsion of vehicles on common roads. The component parts or elements of motor-vehicles are dealt with in Part II., boilers and motors claiming first attention. The author gives illustrations and particulars of several well-known French and English types of boilers as used in steam motor-vehicles and concludes the chapter with the remark that he looks to the production of a practical rotary steam engine to give an impulse to the construction and use of steam-driven vehicles. Petrol motors and carburettors used with the same are dealt with at great length, no less than about 130 pages being devoted to their description. This part of the

THE RECENT "COUPE DES VOITURETTES" RACE—OUR CORRESPONDENT'S PARTY ON THE BRIDGE AT TRIEL.

work should prove exceedingly useful to those who are devoting their attention to the subject of petrol motors, for practically all the leading types in use on the Continent are here illustrated by sectional drawings. Passing over a chapter on accumulators and electromotors we come to one which should be of interest to many who are just now grappling with the very question, viz., the necessary horse power of the motor for an automobile. The author devotes considerable space to a solution of the question, and his remarks are well worthy of close study. The transmission of the power of the motor to the road axle, the suspension of the frame, bodies, wheels, tyres, axles, brakes, lubrication, etc., are all subjects which are treated at length in subsequent chapters. Part III. extends to over 140 pages, and comprises descriptions of all the principal steam, petrol, and electric vehicles at present on the market, not only of French, but of English, German, Belgian, and American construction. The fourth and final part is devoted to a summary of the results obtained in the various motor-car races and trials that have been held in France and elsewhere since 1894, the work concluding with a short outline as to the parts of the present automobile in which, in the author's opinion, there is room for improvement. Altogether, M. Lavergne's book can be recommended to all engaged in motor-car construction; the work, which extends to over 700 pages, is illustrated by 329 figures, and, what is of great advantage, is provided with a useful index.

AUTOMOBILE RACING.

THE popular idea upon which the speed of an automobile depends is, like most popular ideas, entirely wrong. By some it is held that a certain automobile is faster than another merely because its motor develops a greater number of horse-powers. Others maintain that the speed of the carriage is governed by the size of the wheels, and support their statement by comparing the automobile with the high-speed locomotive, which, with its huge drivers, is speedier than the small-wheeled freight engine. Undoubtedly there is a grain of truth in the assertion that a relationship exists between speed and horse-power; but if the subject be critically studied it will be found that the factor of speed in motor-carriages depends not upon one condition alone, but upon five—(1) the horse-power of the motor; (2) the number of revolutions made by that motor; (3) the weight of the vehicle; (4) the gearing; (5) construction of the moving parts as well as of the entire carriage, to reduce friction as much as possible.

If the other four conditions be the same, it cannot be denied that, of two carriages, the faster will be the one having the more powerful motor. But the speed of a motor has also an effect upon the speed of the carriage; for the greater the number of revolutions made per minute by the fly-wheel, the more swiftly will the driving-wheels of the carriage be turned by the intermediate gearing, and the greater will be the distance covered in a given time. The number of revolutions made by automobile motors varies between 600 and 1,200 per minute; the average motor makes between 800 and 900 revolutions. In all modern automobiles the number of revolutions can be increased by means of an "accelerator." If the motor were constantly run at maximum speed it would very evidently soon deteriorate, for which reason the careful automobilist will push his carriage to the utmost only when he is ascending exceedingly steep grades, or when it is necessary for him to cover a given distance in the shortest possible time. As a general rule, high-speed motors are used only on pleasure vehicles; heavy trucks, in which tractive force is the main consideration, are usually driven by engines which make comparatively few revolutions per minute.

Weight is also an important condition upon which the speed of the carriage depends. Often enough it has happened that in ascending a grade one of the occupants of a vehicle has been compelled to alight in order that the motor, already running at its highest speed, might drive the carriage to the summit. Indeed, the motor is sometimes capable of driving only the vehicle up a hill, and the driver himself must perforce walk beside his carriage. It is plain enough that a 12-horse-power carriage weighing only 1,500 pounds will make better time than if it weighed 3,500 pounds, and that a light, two-seated car will be speedier than a heavier, four-seated vehicle. As an example, heavy autotrucks may be cited, which, although provided with powerful motors, run at very low speeds but develop considerable tractive force. These trucks can transport loads varying from five to ten tons, depending upon the horse-power of the motor. For this reason, French manufacturers are beginning to build wagon bodies of partinium, an aluminium-tungsten alloy of very nearly the same specific gravity as pure aluminium, but of far greater strength.—Extract from an article by Edwin Emerson, jun., in the *Automobile Magazine*.

THE Sporting Commission of the French Automobile Club has decided that British automobilists who are not permitted to take part in the competitions organised by the Automobile Club of Great Britain will not be permitted to take part in the races and competitions organised by the A.C.F.; and, reciprocally, French competitors who are not permitted to take part in the races in France will not be allowed to take part in the competitions of the A.C.G.B.I.

THE BRIERRE MOTOR-VOITURETTE.

OF the making of light two-seated motor-voiturettes in France there seems to be no end. One of the smartest-looking cars of this type which have come under our notice lately is that which has just been put on the market by M. E. J. Briere, of 239, Boulevard Péreire, Paris, and of which illustrations are given herewith. As will be seen from the plan, Fig. 2, the motor is located at one side of the rear of the frame; it is of the horizontal single-cylinder type of $3\frac{1}{2}$ h.p. The normal speed of the engine, which is of the "Morisse" type, is 850 revolutions, the diameter of the cylinder being 90mm., and the stroke 120mm. The ignition is electrical, while for cooling purposes the cylinder is provided with radial fins and the combustion and valve chambers with a water-jacket, the circulation being maintained by a thermo-siphon arrangement. The carburettor is of the Longuemarc type. Three forward speeds—12, 20, and 35 kilomètres per hour—are available; a friction-clutch controlled by a foot-pedal is provided, the female portion of which is fast on the motor shaft, while the male portion is connected

FIGS. 1 AND 2.—ELEVATION AND PLAN OF BRIERRE VOITURETTE.

with the variable speed gear. The latter consists of a series of spur wheels, any one of which can be brought into gear with corresponding pinions on an intermediary shaft below. From the latter, the power is transmitted by a centrally-located pinion to a spur wheel on the rear axle, no chains or belts being thus employed. The frame is of tubular construction, and is suspended on the axles by springs both at front and rear. The body is built up of wood and aluminium, while the wheels are of the cycle type, shod with Michelin pneumatic tires. Steering is controlled by an inclined hand-wheel, while there are band brakes on the differential and on drums on the rear axle. The petrol tank is located in the fore-part of the car, that for the water being under the seat. The car measures, over all, 8ft. 2in. by 5ft., and weighs only about $4\frac{1}{2}$ cwt. It will, it is claimed, mount any ordinary gradient, and in view of its relatively low price—3,200 fr. (£128) in France—should quickly meet with a large adoption.

THE charging station, with the machinery, plant, licenses, cabs, and premises of the London Electrical Cab Company, Limited, at Juxon-street, Lambeth, S.E., are being offered for sale by tender.

The Brierre Motor-Voiturette.

(For description see page 34.)

FIG. 3.—GENERAL VIEW.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The Italian Party for Nice.

THE party of Italian *chauffeurs* bound for Nice will leave Turin at eight o'clock on Sunday morning next, and during the day will travel as far as Tende. There they will spend the night, and make a fresh start for Nice early the following morning. As is almost invariably the case in trips of this description the number of actual participants is considerably less than the number of names inscribed, and the certain starters in this instance have now been reduced to seven. These are the Count Biscaretti di Ruffia and his son, Messrs. Charles Agnelli and Gorio-Gatti, Count Cacherano di Bricherasio and Count G. de Mirafiori. Their presence at Nice will add greatly to the international character of the meet, and they will assuredly be accorded a warm and hearty welcome by the members of the "A.C.N."

At the "A.C.F."

known as the "Course de l'Éventail." The voiturette and motor-cycle classes will be open, however, to all competitors.

The club committee have also decided to manage the Paris-Brest race, which is being organised by *Le Matin* for July 5th, 6th, and 7th. The official timekeeper for the year is M. Ch. Saloman, the committee having made the appointment at a recent meeting.

Accidents in France.

THREE most regrettable accidents caused by automobiles have occurred during the last week or so, two of them being reported from the Mantes district. In the one case a little girl of eleven years, named Angèle Lemenu, was returning to her home at Saint Illiers-le-Bois, when she was knocked down and instantly killed by a car coming up behind her. The affair has caused a painful sensation in the neighbourhood, where the child's family are well known, her father being mayor of Saint Illiers. In the other instance the mishap occurred to a waggoner while leading a horse and cart at Saint Martin-la-Garonne. A passing automobile frightened the horse, which promptly bolted, dragging the conductor off his feet. The cart passed over the unfortunate man, causing injuries from which he is not likely to recover. The third accident happened to a *mécanicien*, who was driving his master's car to Blois. When close to Montrichard a punctured tire caused the vehicle to upset, burying the driver under it. There he stayed from 11 p.m. until 3 a.m., and when discovered by the local postman and conveyed to a neighbouring hotel he was in a pitiable state. He is, however, making satisfactory progress towards recovery.

Belgian Number Plates.

FOR some time past Belgian automobilists have been awaiting with anxiety the appearance of the number plate which the authorities recently decreed should be attached to the fore-carriage of every motor-vehicle. This plate has now been issued, and its aspect excites much discontent in automobile circles, for it is heavy and cumbersome in appearance. The number appears in large figures in the centre, and is surmounted by the word "Belgique," while a number of holes are pierced in the plate to permit of attachment to the vehicle. The dimensions are 25 centimètres in length by 10 centimètres in height, and as the same size will be employed for all types of automobiles its attachment to motor-cycles will be a serious incumbrance to the rider. The owners of handsome carriages are much aggrieved that their beautiful vehicles shall be disfigured with this hideous plate, but they have no remedy, and must forthwith display the number.

Gasté's Records.

ON Sunday last, the 18th inst., a continuation of the attempts on records took place, and this time Gasté was the performer. Forsaking the famous Achères track in favour of the main road from Paris to Toulouse, Gasté made his trials at Ferté-Saint-Aubin, and was timed by MM. Gaudichard and E. de Perrodil. The attempt on Béconnais' figures of 59 $\frac{1}{2}$ sec. for the kilomètre from a stationary start proved entirely successful, as Gasté covered the distance in 56 $\frac{3}{4}$ sec., an improvement of

THE RECENT "COUPE DES VOITURETTES" RACE—THE DECAUVILLE CAR WITH WATER-COOLED MOTOR.

2 $\frac{1}{2}$ sec. The kilomètre with flying start was only made in 46 $\frac{3}{4}$ sec., as against Béconnais' record of 42 $\frac{1}{2}$ sec., and the attempt on the latter's figures of 1min. 42 $\frac{1}{2}$ sec. for the two kilomètres from a stationary start was also a failure. The other attempts made were successful, these being: 1 mile (stationary start), 1min. 23 $\frac{1}{2}$ sec.; 1 mile (flying start), 1min. 15 $\frac{1}{2}$ sec.; 2 kilomètres (flying start), 1min. 32sec. Gasté announces his intention to attempt to lower the existing figures for 10 and 100 kilomètres at an early date.

Paris Cabdrivers.

BETTER counsels have prevailed, and the professional automobile drivers of Paris have banded themselves together, not as a syndicate on aggressive lines, but as a peaceful mutual-help society, under the title of "The Union of Automobile Conductors." This wise decision was arrived at on the 10th instant, when a fair number of drivers met at 47, Avenue de Wagram, under the presidency of M. Le Lorrain, a well-known trade councillor. At this meeting the articles of association were submitted and passed, the principal objects of the society being:—(1) Defence of the members' professional interests; (2) Formation of an employment office; (3) Distribution of help to

members impoverished by accidents or by lack of employment; (4) Technical and practical instruction in mechanism relating to automobiles. The annual subscription was fixed at 12 francs, or 1 franc per month, and the entrance fee at 50 centimes. The officers for the year were also elected, and upwards of a hundred drivers were enrolled on the membership list.

A Maiden Race.

THE well-known paper, *La Vie au Grand Air*, has announced its intention to organise an automobile race for Friday, April 20th, of which the special feature will be that only those *chauffeurs* who have never participated in an automobile race will be eligible to compete. The categories in this course are:—(A.) Motor-cycles of one seat; (B.) Quadricycles of two seats and motor-cycles with trailing-car; (C.) Voiturettes of four wheels and two seats side by side, weighing from 250 to 400 kilos; (D.) Cars of at least two seats, exceeding 400 kilos in weight. Valuable *objets d'art* will be awarded to the successful competitors, and the race should afford a capital opportunity for some of the amateur drivers to show their prowess.

The Paris-Roubaix Race.

IT was in 1898 that *Le Vêlo* inaugurated a class for motor-cycles in the annual bicycle race from Paris to Roubaix, and which at that period was in its third year of existence. The experiment proved so successful that the promoters decided to make it an annual fixture, and accordingly we are to see the third of the series this year, the exact date being Sunday, 15th April. Starting from Chatou the route followed will be by way of Saint-Germain, Conflans, Pontoise, Beauvais, Breteuil, or Amiens, Montdicourt, Arras, and Lesquin, a distance of 228 kilomètres, or 165 miles. The prizes which *Le Vêlo* offers amount to 1,050 fr. (£42), of which 500 fr. (20) go to the first man home. The winners have the option to take their awards in money or *objets d'art*. This race is sure to bring out a great number of competitors, several of whom should experience no great difficulty in beating the average speed of 47 kilomètres 928 mètres (30 miles) per hour made by Osmont in last year's event. Intending competitors should send in their names, together with fee of 5 fr., to the office *Le Vêlo*, Paris, on or before 9th April next. Among the motor-cyclists who have already entered are Myer, Béconnais, Rigal, Marcellin, Osmont, Faiteau, Lerod, Baras, Grandclaude, Tart, L. Willaume, Bathiat, Martin, Rivierre, and Champoiseau.

Departures for Nice.

THE hero-worshipper of the Avenue de la Grande Armée in Paris has, alas! but little to worship at the present moment, for a wholesale exodus of automobile celebrities *en route* for Nice has recently taken place, and no longer do the De Knyffs and Charrons come and go in the famous avenue. But the small boy was afforded a moment of supreme happiness last Saturday morning, when the first and largest contingent of *coureurs* took its departure from Charron's. What a babel there was, to be sure! The tooting of horns, the beat of powerful motors, the farewell cries from friends, and the yells of encouragement from the crowd dinned in one's ears long after the last of the fourteen cars had passed the Porte Maillot. Among the drivers were MM. René de Knyff, Pinson, Lemoine, Gilles Hourgières, Lavertujon, Clément, and Holtzer. The squadron lunched at Montargis, and then proceeded to Saint-Etienne, where they spent a couple of days. The famous Jacob Holtzer mines and rolling mills were visited; and then, after their rest, a fresh start was made for the "Côte d'Azur," the party being strengthened by the inclusion of M. Etienne Giraud, who had left Paris on the Sunday. Last Monday witnessed the departure of MM. Bozon de Périgord, Mors, Velghe, and Voigt, while a couple of days later M. Charron left the capital, M. Girardot following suit next day. The racing at Nice will undoubtedly be very keen, for the list of entries is excellent, both as regards quantity and quality, and all are anxious to score during the famous week.

M. Krieger's Case.

THE latest figurant in the Paris courts is no less a personage than Monsieur Krieger, who last week appeared before the Eleventh Chamber of the Tribunal de la Seine, charged with having driven his car in a negligent manner on the night of November 28th last, thereby colliding with a cab and causing

NEW PATTERN OF TURGAN-FOY VOITURETTE.—(For description see issue of October 6th last.)

rather serious injuries to the driver. From the evidence given before the court it appears that at 11.30 in the evening of November 28th M. Krieger was driving his car in the Avenue Duquesne, and was in the act of turning into the Avenue Lowendal when he came into violent collision with a cab. As might be expected, this came off second best, and the cabby was thrown from his seat. It was conclusively proved that M. Krieger had held to his proper side of the road, and that the *cocher* had been driving to the left, and not to the right as is the rule in France, but on the other hand, witnesses of the accident stated that the car was travelling at the rate of twenty-two miles per hour, and that M. Krieger had not sounded his horn in turning the corner. After a long and lively hearing the court condemned the *chauffeur* to pay a fine of £4, and to make the cabby a provisional allowance of £40 pending the presentation of a doctor's report as to his injuries. Upon the nature of this report will depend the sum to be awarded as compensation and damages.

The Nice Week.

It is on Sunday next, the 25th instant, that the round of automobile *fêtes* and races, known as the Nice week, commences, and reports to hand state that such a gathering of *chauffeurs* has never been witnessed before in the town. They arrive from all quarters, racers and tourists mounted on all manner of vehicles and cycles. What a sight to gladden the heart of the motor-man! A little amusement in the form of a *corso fleuri* is set down for decision on Sunday, a kind of *aperitive* to whet the automobile appetite for the more exciting events to follow. All the same everyone enjoys this floral sport, and last year it was voted a greater success than the battle of flowers in which the horses and ordinary carriages figured. On Monday, the 26th instant, the first stage of the Nice-Marseilles-Nice race will be run off. An early start—at 7 a.m.—will be made, and a

route of 230 kilomètres to Marseilles via Cannes, Fréjus, Le Luc, Brignoles, Saint-Maximin, Trets, and Gardanne will probably be followed. At 10 o'clock on the following morning the second stage will be commenced, the route to Nice being by way of Aubagne, Ollioules, Toulon, La Garde, La Pauline, Hyères, Sainte-Maxime, Fréjus, and Cannes. The entries for this event include the names of very many of the most prominent *coureurs* of the day, among whom I may cite—Albert Lemaitre, Charron, Girardot, R. de Knyff, Gilles Hourgières, Levegh, Bozon de Périgord, Pinson, Marcellin, Gasté, Béconnais, Rigal, Baras, and Gleizes. While the racing automobiles are completing the return journey to Nice on Monday, the tourists will be contesting the first stage of the Nice-Draguignan-Nice course. The distance to be covered is 98 kilomètres. The competitors will pass the night at Draguignan and race back to Nice over the same route the following day. Wednesday, the 28th inst., will be devoted to an exhibition of the vehicles of competitors, who have completed one or other of the two courses. The cars will be shown in the Automobile Club's garage on the Boulevard Gambetta. The *course du mille* will be the feature of Thursday, the first of the heats being run off at two o'clock in the afternoon on the Promenade des Anglais. The last of the races will take place on Friday, March 30th, and will be decided over the well-known Nice-La Turbie route. This hill climbing course of 17 kilomètres will be opened to all those cars who shall have completed the race for which they were engaged. The "week" at Nice terminates with this race, but the other events which will be held on the Riviera will keep racing men full of engagements until April 4th, after which date the scene of operations will be changed to Paris.

The Grosse-Boubault Motor-Tricycle and Two-Speed Gear.

MESSRS. GROSSE AND BOUBAULT, of 97, Boulevard de Montparnesse, Paris, have lately brought out a new motor-tricycle, for which they claim several advantages. The machine is chiefly noticeable for its motor, which, although

GENERAL VIEW OF TURGAN-FOY MOTOR.—(For description see issue of February 2nd last.)

its weight and size are small, develops two and one-half horse-power. The *culasse* or cylinder top, which, viewed from the exterior, is of considerable size, contains a chamber for the detention of the gases, which are allowed to escape through the top. This arrangement, in addition to the spiral-radiating flange running from the base to the top of the cylinder, completely pre-

vents, it is claimed, over-heating. The expansion-chamber is integrally formed with the compression-chamber, the two being separated by a partition, which provides a seat for the exhaust-valve. Oxidation of the valve-stem is prevented by a metal tube, which operates in conjunction with the valve so as to prevent a binding of the stem and to insure perfect operation. A forced circulation of air about the helicoidal flange of the cylinder is obtained by the employment of a casing, so arranged as to utilise the current of air generated when the vehicle is in motion. The efficiency of the motor's operation is still further increased by the employment of a special carburettor, which is said to be regular in its operation, irrespective of the character of the road over which the vehicle may be running. A special two-speed gear, devised by Messrs. Grosse and Boubault, can be applied to the tricycles. The mechanism employed comprises an auto-

FIG. 1.—REAR VIEW OF TRICYCLE.

FIG. 2.—VIEW OF TWO-SPEED GEAR.

matic friction-clutch, by means of which the machine can be gently started, and a crank-operated driving-gear.

An Exhibition in Holland.

A CYCLE and motor-car show was held in the Paleis voor Volksvlijt, Amsterdam, from the 9th to the 18th inst. Altogether there were about fifty exhibitors, motor-cars and cycles being present in much larger numbers than a year ago. Willem Gerth, Utrecht, displayed a 1½ h.p. Dumond motor-quadricycle, a two-seated 2½ h.p. "Bella" voiturette, a 3 h.p. "Ideal" voiturette, and a four-seated 5 h.p. Vallée car. In addition to a Comiot-Eadie motor-tricycle, Messrs. Verweij and Lugard, of 17, Nassau-Dillenburgstraat, The Hague, had a big display of Peugeot automobiles, ranging from the two-seated voiturette up to a twelve-seated 12 h.p. omnibus. Benz cars of several types were shown by M. W. Aertnys, of Nimegen, who also had a Mors dog-cart on view. Messrs. R. S. Stokvis and Zonen, of Rotterdam, exhibited a couple of Pieper cars, one propelled by a 3½ h.p. petrol motor and one a combination electro-petrol vehicle.

Half-a-dozen De Dietrich (Amédée Bollée) cars, including an example of the "Vivinus" voiturette, were to be seen at the stand of B. J. Rubens, of Amsterdam, while W. J. Stokvis, of Arnhem, displayed three Daimler cars, a De Dion voiturette, a tricycle and a quad. Three Decauville cars—two with 3 h.p. air-cooled motors, and one with a 5 h.p. water-jacketed motor—formed the exhibit of H. J. Van Ewijk, of Amsterdam. In addition to a number of Benz cars, Die Industrielle Maatschappij Trompenburg, of Amsterdam, showed a car fitted with a new motor, known as Spijkers. It is a double-cylinder balanced motor of 5 h.p., with water-jacketed cylinders and electric ignition. Messrs. Willem Remmers, and Co., Amsterdam, confined their exhibit to a large ten-seated 10 h.p. German Daimler omnibus. John D. Diehle, jun., of 98, Jan Van Riebeckstraat, The Hague, had quite a large stand, on which were shown a "Perfecta" tricycle and quadricycle, a De Dion motor, a racing tricycle with Aster motor, a three-seated Benz car, a four-seated Darracq (Leon Bollée) car, and a three-seated Bollée car. Two cars—a three-seated Duc and a four-seated Dos-à-Dos—were shown by the "Gelria" Machine en Motorenfabriek, of Arnhem. The vehicles were fitted with 4 h.p. vertical two-cylinder motors, provided with a special system of magneto-electrical ignition. The Algemeene Nederlandsche Autocar-Maatschappij, of The Hague, displayed a six-seated 7 h.p. Delahaye car, as also a couple of French (Bouquin-Garcin-Schivre) electrical vehicles. Motor-vehicles and cycles were also shown by the Automobielenfabrik Duisburg (D. Siem, jun., Amsterdam), the Erste Nederl. Rijwielenfabriek (Burgers), of Deventer, and the Simplex Rijwielenfabriek.

CORRESPONDENCE.

A LONG "NON-STOP" RUN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having just accomplished a run of 221 miles, viz., from Edinburgh to Selby on my 6-B.H.P. Daimler car without once stopping, I shall be indebted to you if I can learn through your columns if this distance has ever been exceeded in this country. I left Edinburgh at 9 p.m. on Wednesday night, and passed Berwick, Newcastle, and York at 12.30 a.m., 5.30 a.m., and 12 noon respectively, reaching Selby at 2 p.m. on Thursday, thus running sixteen hours consecutively. The car consumed eleven gallons of petrol, and one gallon of water. Had it not been for wind and rain I see no reason why the car should not have run nearly as far again, as I had nine gallons of oil unused and as both the motor and all the bearings were perfectly cool, although the latter are only fitted with the standard small-size lubricators. Trusting some of your readers who own powerful racing cars will favour me with a reply.—I am, etc.,

Edinburgh, March 17, 1900.

T. ROLAND OUTHWAITE.

MOTOR-CAR SERVICES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am not a practical motorist—merely an interested person who regards the motor-car as the vehicle of the future but who cannot afford the means of purchasing a vehicle.

But having enjoyed some very pleasant trips on motor-vehicles I am anxious to indulge in such enjoyment during the coming summer. Unfortunately, the vehicles in use at sea-side resorts are too often uncared for by their proprietors and do not exhibit automobilism in a very favourable light. My object in writing is to urge all those responsible for motor-car services to pay attention to the appearance of the vehicles, never to send them out dusty and dirty, and to see that the drivers are not only efficient in their special department but respectful in their general demeanour. This latter feature would be quite a novelty at many sea-side places.

Birmingham, March 19th, 1900.

Yours truly,
A MIDLANDER.

A GOOD RUN ON A DAIMLER CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—The following particulars of a run from Coventry to London on my old car—one of the first turned out by the Daimler Company—may be interesting. If some of the owners of

French cars of equal power could give us particulars of any better runs, or even one equalling it, it would tend to show us where the great improvement and superiority of the French cars are. In my opinion they exist only in the fancy of the owners, who have paid "a long price" for the name. Of course, if a car were fitted with pneumatic tires they would add quite two miles an hour to the speed. My car is fitted with solid tires, and is not high geared; yet the other day I ran through from the Daimler Company's works in Coventry to Hampstead (inside the four-mile circle), a distance of about 90 miles, in 4h. 50min. The motor was not stopped once on the road; under a quart of water was used, and only 3½ gallons of petrol. The average speed for the whole journey was 19 miles per hour.

Yours truly,
E. ESTCOURT.

1, Ellesmere Mansions, Canfield Gardens,
Hampstead, March 19th, 1900.

THE DE DION AND BOUTON PATENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—With reference to the De Dion and Bouton patents I desire to point out to you that there seems to be some error as to the steps Messrs. De Dion and Bouton have really taken in France to protect their patents, and it may be of interest to your readers if I explained the position. At the last Salon de Cycle you reported that Messrs. De Dion and Bouton have made a *seizi*, and without an explanation of this term your readers may fall into the error that they have made a seizure. It is nothing of the kind, a *seizi* in France is nothing more nor less than a slightly more legal form of a solicitor's letter. In other words, Messrs. De Dion and Bouton wrote solicitors' letters to people they alleged had infringed their patents, which infringement, by the way, they put down merely to the four posts on the air-cooled motor. Apart from this, Messrs. De Dion and Bouton have never taken any action against any person or persons, with the exception of one firm, which had gone into liquidation, Messrs. De Dion obtaining a judgment on account of the action being undefended. Apart from this action, Messrs. De Dion and Bouton have made no movement whatsoever, nor are they likely to do so, against any firm in France.

It might also interest your readers if I mention that the famous trembler over which many people came to great differences as to its value as a *bona fide* patent has now been found, or at least I should say the anticipation has been found. It is published in a French book under the name of the trembler Gauthier, which book was published many months previous to the dates of Messrs. De Dion's patent. The design of the trembler Gauthier is given, and it is in every way similar to De Dion's patent, showing as well as the trembler the same cam containing the identical slot. I should be pleased to give any of your readers the name and date of this book, if it interests them.

Yours faithfully,
The Automobile Association, Ltd.,
D. M. WEIGEL.

Prince's Road, W., 17th March, 1900.

THE SPEED OF MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A great objection to such a modification of the legal limit as is suggested by "Precursor"—i.e., the prescribing of one limit for the country and another for town—is, that it would lead to endless disputes as to the meaning of "town." On the other hand, I venture to say that the present limit, being applicable to all places, and confined to one type of vehicle, is useless, if not mischievous. For a regulation which is practically ignored, and that without causing any disaster, by most of those to whom it applies—from one of Her Majesty's judges downwards—is worse than useless, since it brings law into contempt.

What is the object of a legal speed limit? It is not, as certain people—who seem to take a pride in displaying their ignorance of the subject—seem to think, intended to provide a

means of bullying, and, if possible, suppressing a means of locomotion against which they are prejudiced, but merely to promote the public safety. But this is already sufficiently safeguarded by the furious driving clause of the Highway Act, and further legislation on the point would seem superfluous.

Moreover, seeing that the public safety is the only condition to be observed, there is no reason, other than the legal limit, why a motor-man should not on a deserted and open road drive as fast as he thinks desirable—indeed, I believe it is proper that he should do so; while the most reckless will hardly conceive himself entitled to drive at the legal twelve miles an hour through a crowded street. It will be seen, therefore, that speed is really regulated by the discretion of the motor-man, and that any legal limit is unnecessary.

There is, however, one form of it which may be advisable, which is adopted by railway companies, and which consists in displaying notices at suitable points, limiting the speed at those spots. Of course, too, this should apply to all vehicles, for, "except for the honour of the thing," it makes little difference to the victim of an accident whether he was run over by a horse-van or a motor-car. Free and rapid locomotion, as all students of history will admit, is a potent factor in the well-being of a nation; it is, indeed, a necessary adjunct to Free Trade, and any improvement therein should be fostered and encouraged instead of, as is usually the case, penalised and taxed.

Automobilism is such an improvement; one, too, that will probably prove of greater benefit to the country at large than even the introduction of railways; for it will enable the streams of rapid traffic to be distributed widely over the country, instead of their being confined to a comparatively few channels. There is no doubt that in the coming years the average speed of traffic, hitherto limited by the power of the horse, will be largely increased; for as the pedestrian has trebled his pace by the use of the bicycle, so will the driver by means of the motor.

I believe, therefore, that it would be for the public good that as high a speed as is consistent with the public safety should be permitted, if not encouraged, and that there should be no taxes on locomotion.

March 20, 1900.

Yours truly,
"JANUS."

THE NEW WERNER MOTOR-BICYCLE.—For description see issue of March 2nd, page 816.)

IN addition to their bicycle business, the Keating Wheel and Automobile Company, of Middletown, Conn., expect to be fully equipped for the manufacture of automobiles in about a month. It is also reported that they will take up the manufacture of motor tri-cycles.

THE DESIGN OF AUTOMOBILES.

ACCORDING to the plan almost universally adopted for motor-vehicles, the weight of the power source and motor is supported by the same axles and wheels that support the weight of the driver, passengers, and load; the rear axle is rotated by the motor power through gearing or belt, and the propelling power is transmitted through the wheels

and applied against the surface of the road. Steering is effected by the driver using main force to turn the front wheels around vertical pivots that carry horizontal stub axles for the wheels.

These are points of radical difference between the automobile and horse-drawn vehicles, but it is safe to say that they do not exist by express intention of automobile constructors, but have merely followed from a natural inclination to make the automobile conform as nearly as possible to the customary outlines of an ordinary vehicle. If they serve the purposes of an automobile, it is by accident. It is interesting to note how many important chances for errors in other constructional details spring from these differences alone, and how few of them have been considered in relation to road and street conditions and the requirements of the public.

These simple points go far to explain the many breakdowns of automobiles that have been noted during the past year, and are therefore of special interest, although automobile constructors as a rule have considered them as of inferior interest compared to the problems of the motor and the transmission gear between the motor shaft and the wheel axle. And in reality these latter problems are perhaps of superior importance where the roads are uniformly excellent.

I do not agree with the commonly prevailing opinion that the proper construction of an automobile is a matter of ordinary mechanical engineering and machine design, and may be accomplished through the mere application of already acquired knowledge. In place of this supposition, according to which perfect automobiles might make their appearance any day, it is desired to show that experience in the art of building them must overbalance science in importance when it comes to building automobiles, and that therefore a considerable time must elapse before automobiles may be produced that will be thoroughly acceptable to anybody but enthusiasts, unless some phenomenal genius happens to strike the right solution by one miraculous stroke; and the chances for that are at all times and in all cases exceedingly remote. They are made still more remote by the fact that not one but several dozens of automobile types of vehicles, presenting essential variations, must be evolved before the horse may be considered as successfully supplanted in its principal fields of work.

The strength of the ordinary carriage, buggy, spring wagon, etc., to resist the knocks dealt by bad drivers, bad roads, and unruly horses is a good deal like the strength of the bamboo hut, which sways to the blow of the hurricane, but still stands after the blow is over, while the stone mansion collapses; or like the strength of the thin glass which escapes breakage and injury in the careless hands of the kitchen mechanic, while the thicker one chips off on the edges at the slightest jar against a hard substance and cracks from inner tension when it is exposed to heat and cold unevenly. It is the strength of elasticity, the strength in yielding. It depends on a certain degree of thinness of material, certain proportions in dimensions, and upon the choice of materials used in construction. Many things pertaining to the art of incorporating the strength of elasticity in carriages and other structures in which it is required, have been learned solely by experience, and have not yet been scientifically mastered. They are not booked in the manuals of engineers, but an understanding of this factor and a happy knack of applying it correctly have often spelled the difference between failure and success among architects, bridge-builders, carriage-makers, and others, and is of greater importance the more varied and incalculable are the

strains to which the structure is subjected. While architects and bridge-builders have mainly to figure with loads and wind velocity, builders of carriages and automobiles must take into consideration such factors as weight and load aggravated by speed, turns, impact with the inequalities of bad roads, up and down hill work; and they are furthermore handicapped by the æsthetic requirements of the public in regard to design and outlines. What is of greatest interest in connection with the subject of automobiles is the enormous disadvantage under which automobile makers labour as compared to carriage makers in this respect, on account of the greater weight of the structure, the higher speed expected of it, the consequently very highly increased force of all impacts and shocks, and the additional strains arising from the workings of the power mechanism.

Everybody who has given any thought to the mechanics or art of carriage building knows that the questions pertaining to design and material are most intimately mixed up with the requirements for elastic strength and that there comes a point in the dimensions of any construction part—of a given material and form—where it becomes impossible to combine the required elastic strength in said constructional detail with the brute strength that may also be required of it. It would break if thinner, and it would be too unyielding if thicker. If such a case arises, it may be necessary to choose a new material by the use of which the two requirements may be combined; for the proportions vary largely according to the nature of the material that is used as well as its form.

The easiest way out of difficulties of this kind is to sacrifice the elastic strength and add sufficient to the brute strength to resist all shocks. That is what was done before springs were used for carriages, and what is still being done in cheap carts for rough work. It is also being done by that school among automobile builders who believe in making the automobiles "so heavy that they will not bound over a rough road." But by following this easy principle, which testifies to a certain mental indolence in its adherents, carriages become clumsier and heavier than necessary. In ordinary carriage building, the preference in the United States has been decidedly for the opposite principle of making every part as thin, elegant, and light as possible, and by the ingenuity of the construction to ease the strains on any one part. It is by following this principle that American carriage builders have earned the reputation of making the strongest and at the same time the most elegant carriages in the world. They have been assisted in reaching this proud position through their fortunate access to the use of hickory wood, which has greater tensile strength than any wood native to Europe. Lately new developments in the same direction have been due to the introduction of steel tubing, aluminum, and rubber.

It does not seem likely that the prospective buyers of automobiles will be willing to forego the demand as to combined strength and style to which they have been accustomed in horse-drawn vehicles. But to introduce this desirable combination in automobiles so long as the present plan of construction is followed, meets with serious difficulties which are not usually realised by the public, and which are put aside by constructors as being of no consequence in comparison with the inestimable boon of getting rid of the horse. When it is desired to form a sober estimate of the probable progress of automobilism, they must be considered, however.

Proceeding in due order, reference here is only had to the effects of placing the power source and motor in the vehicle and thereby increasing its weight, and it may be premised as self-evident that all difficulties which arise from this cause must be infinitely more serious for vehicles intended to travel over poor roads where the occasions for violent bumps are numerous than for vehicles that may be used over smooth roads exclusively; so that it is quite within the range of possibilities that a French vehicle may be a success in France at a weight of 3,000 pounds, and a vehicle built on the same general plan may be an absolute failure in the United States even at a much lower weight. In this connection it is especially noteworthy that on good roads the strains in a vehicle follow regular lines and planes, along which the necessary strength may be readily provided without much addition of material—as in a bicycle, where the strains are mostly

in the plane of the machine—while on bad roads the strains are utterly irregular and must be provided against in all directions, necessitating an enormous addition of weighty material, unless, indeed, the skilful constructor knows how to provide what has here been called elastic strength, whereby the strains are distributed over a large quantity of material and absorbed in it, instead of being transmitted through a rigid construction and massed according to the direction and nature of the shock—at any one of a number of different points, each of which must be fortified against the entire original shock.

In railway coaches and tramway cars this may be done by dividing the structure into rigid portions flexibly connected by springs, thus absorbing shocks in the latter, or by buffers, but it is only the comparative regularity of the shocks received by rail travel that permits this arrangement. It is readily seen, for example, that under conditions that would twist a railway coach so as to centre a shock in one side of one of the supporting trucks instead of in both sides of two, on a well-ballasted track; either the coach body would need to be made flexible or the springs in each of the trucks would need to be very much strengthened, thereby increasing their weight and diminishing their usefulness for absorbing lighter shocks.

In automobiles it is evident from this parallel that a similar construction plan, consisting in dividing the automobile into large rigid portions, comprising (1) carriage body, (2) the rear wheels and axle and (3) the front wheels and axle—rotatable for steering, but otherwise a rigid whole—with springs interposed between these portions, may be successfully employed only on roads nearly equal to rails as a travel surface. For only on such a surface may irregular strains be averted, and on a rough surface these irregular strains would attack each spring, each wheel, and the carriage body as a whole (through the power mechanism and its connections) with such force that the necessary strength to resist it might only be brought about by a considerable addition of material all over the structure, thus adding still more weight besides that which comes from placing the power source in the vehicle. And it is precisely on rough roads that weight counts heavily to increase the work of propulsion. In other words, in order to propel the thus increased weight, and so on with infinite pyramidally-rising necessity for greater clumsiness and heft. In this sense it may truly be said that weight begets weight. If, on the other hand, an attempt is made to strike a middle course in the construction plan by introducing some degree of elasticity and flexibility in all portions aside from the springs, and especially in the carriage body, the innumerable possibilities for shocks in unforeseen directions on rough roads, makes it a very uncertain thing what particular spot of the structure will be attacked, because by abandoning the system of absolute rigidity of portions of the structure, the possibility has been opened that the shock may attack a part that has not been fortified to with-

stand it, either by its bulk, the nature of its material, or by flexibility and flexible connection with other portions of the structure.

In horse-drawn vehicles all these possibilities have been obviated through the growth of the art of building carriages. Comparative perfection in their construction has been reached by purely empiric methods and cannot be transferred to automobile building. The weight placed in the latter and the new strains arising from having power in the vehicle instead of outside of it, render the problem of constructing them on the flexibility-all-through plan an essentially new one which in all likelihood must be solved by a persevering study and protracted experimenting with new materials to take the place of wood, because wood, in order to be strong enough to resist some of the strains in a heavy vehicle, must be of large dimensions, and when of large dimensions loses its flexibility and adaptedness for distributing other strains arising from shocks of other kinds against which precautions must also be taken.

The only method by which prolonged experimenting may be partially avoided is, as above shown, to adopt the plan of absolute rigidity in each of the main portions of the automobile, accepting great weight as unavoidable. This is the most obvious plan that suggests itself to the orthodox engineer who undertakes to design an automobile in conformity with his mechanical formulas, but even the lay reader will readily understand from the foregoing that the vehicle thus scientifically evolved is, after all, only a good-roads vehicle. Only good roads present the known factors with which the orthodox engineer may figure; while to construct a vehicle for all kinds of roads, and the many unknown factors arising from them to upset calculations, requires art—consummate new-vehicle-building art—and consequently prolonged experimenting

and patient application of the "cut and try" principle.—By M. C. KRARUP, in *American Machinist*.

(To be continued.)

MR. AND MRS. J. J. MANN ON THE NEW MARSHALL CAR. (This vehicle is entered for the forthcoming 1,000-mile trial).

THE Vallée racing car, illustrated in the *Motor-Car Journal* for October 13th last, is now in London. The vehicle, which closely resembles a large shoe on wheels, was driven along Oxford Street and Holborn on Wednesday by Dr. Lehwess, and attracted much attention.

MESSRS. FRISWELL, LIMITED, finding their premises at 18, Holborn Viaduct, E.C., insufficient for their increasing business, have just opened a large new dépôt at 48, Holborn Viaduct. No less than four floors are available, and when we looked in the other day at the Automobile Palace, as the new dépôt has been named, we found quite a large stock of motor-cars and cycles on hand, including Mors, Peugeot, Delahaye, Rochet, Renault vehicles, etc.

THE "CYCLONE" PETROLEUM-SPIRIT MOTOR.

THE accompanying illustrations (Figs. 1 to 4) show a new petroleum-spirit motor, known as the "Cyclone," which has lately been put on the market in France by the Société des Moteurs Cyclone, of 48, Rue Saint-Ferdinand, Paris. As will be seen it is of the vertical two-cylinder type, with radial plates for cooling purposes and electrical ignition. The normal speed of the motor is only 800 revolutions per minute, the claim

FIGS. 1 AND 2.—SECTIONAL ELEVATIONS.

being consequently made that it is less likely to become overheated than those engines whose speed is 1,200 revolutions and upwards. Referring to the illustrations, Figs. 1 and 2, each of the ignition chambers, BB' , is provided with an admission valve a and exhaust valve b . The igniters are represented by $c c'$, and the taps controlling the compression by $d d'$. The pistons are of the single-acting type, and are connected by rods with the shaft E . The lower portion of the operating mechanism is inclosed in a casing F , on which the cylinders are secured. The motor is fastened in position by the shoes ff .

FIG. 3.—SECTIONAL PLAN.

FIG. 4.—PLAN.

At the upper end of each cylinder is a partition g , which serves to deflect the fresh gases admitted through the valve a and prevents mingling with residual gases near the sparking plugs. One of the novel features of the motor is the method employed for controlling the exhaust valves $b b'$. A cam G is keyed on the crank of the shaft E (between the two piston rods $D D'$) and turns therewith. The periphery of this cam is formed with two grooves intersecting at s (Fig. 3). At the upper part of this cam is a roller h engaging the groove and journaled in a lever II (Fig. 2), fulcrumed at i .

The lever has both vertical and horizontal movements, the latter being due to the peculiar 8-shape of the groove. When the lever is shifted horizontally, its flattened free end alternately moves to the extreme points indicated by the numerals 1 and 2 (Fig. 3). In these two positions the lever is given a vertical movement by the cam by which the rods $j j'$ of the exhaust valves $b b'$ are alternately lifted. The reseating of the valves $b b'$ is effected by a spring, the tension of which can be regulated by means of a collar screwing upon the rod. The two pistons, in response to the movements of the single crank of the shaft E , always act together, and as the explosions alternate in the cylinders the motor shaft is driven at a uniform rate of speed. The motor is being made in two sizes—one developing about $1\frac{1}{2}$ h.p. and weighing only 66 lb., and one working up to $2\frac{1}{2}$ h.p., whose weight is given as 1 cwt.

THE WILFORD MOTOR-CAR.

THE illustration given below shows a motor-car of Belgian construction, it having been built by Messrs. Charles Wilford and Sons, engineers, of Tamise, near Antwerp, to the designs of M. Paul Wilford. The motive power is supplied by a two-cylinder horizontal petrol engine of 6-h.p., located in the forepart of the frame. The ignition of the explosive mixture is effected either by an incandescent tube or electrically as desired. The car, as will be seen, takes the form of a four-seated dog-cart,

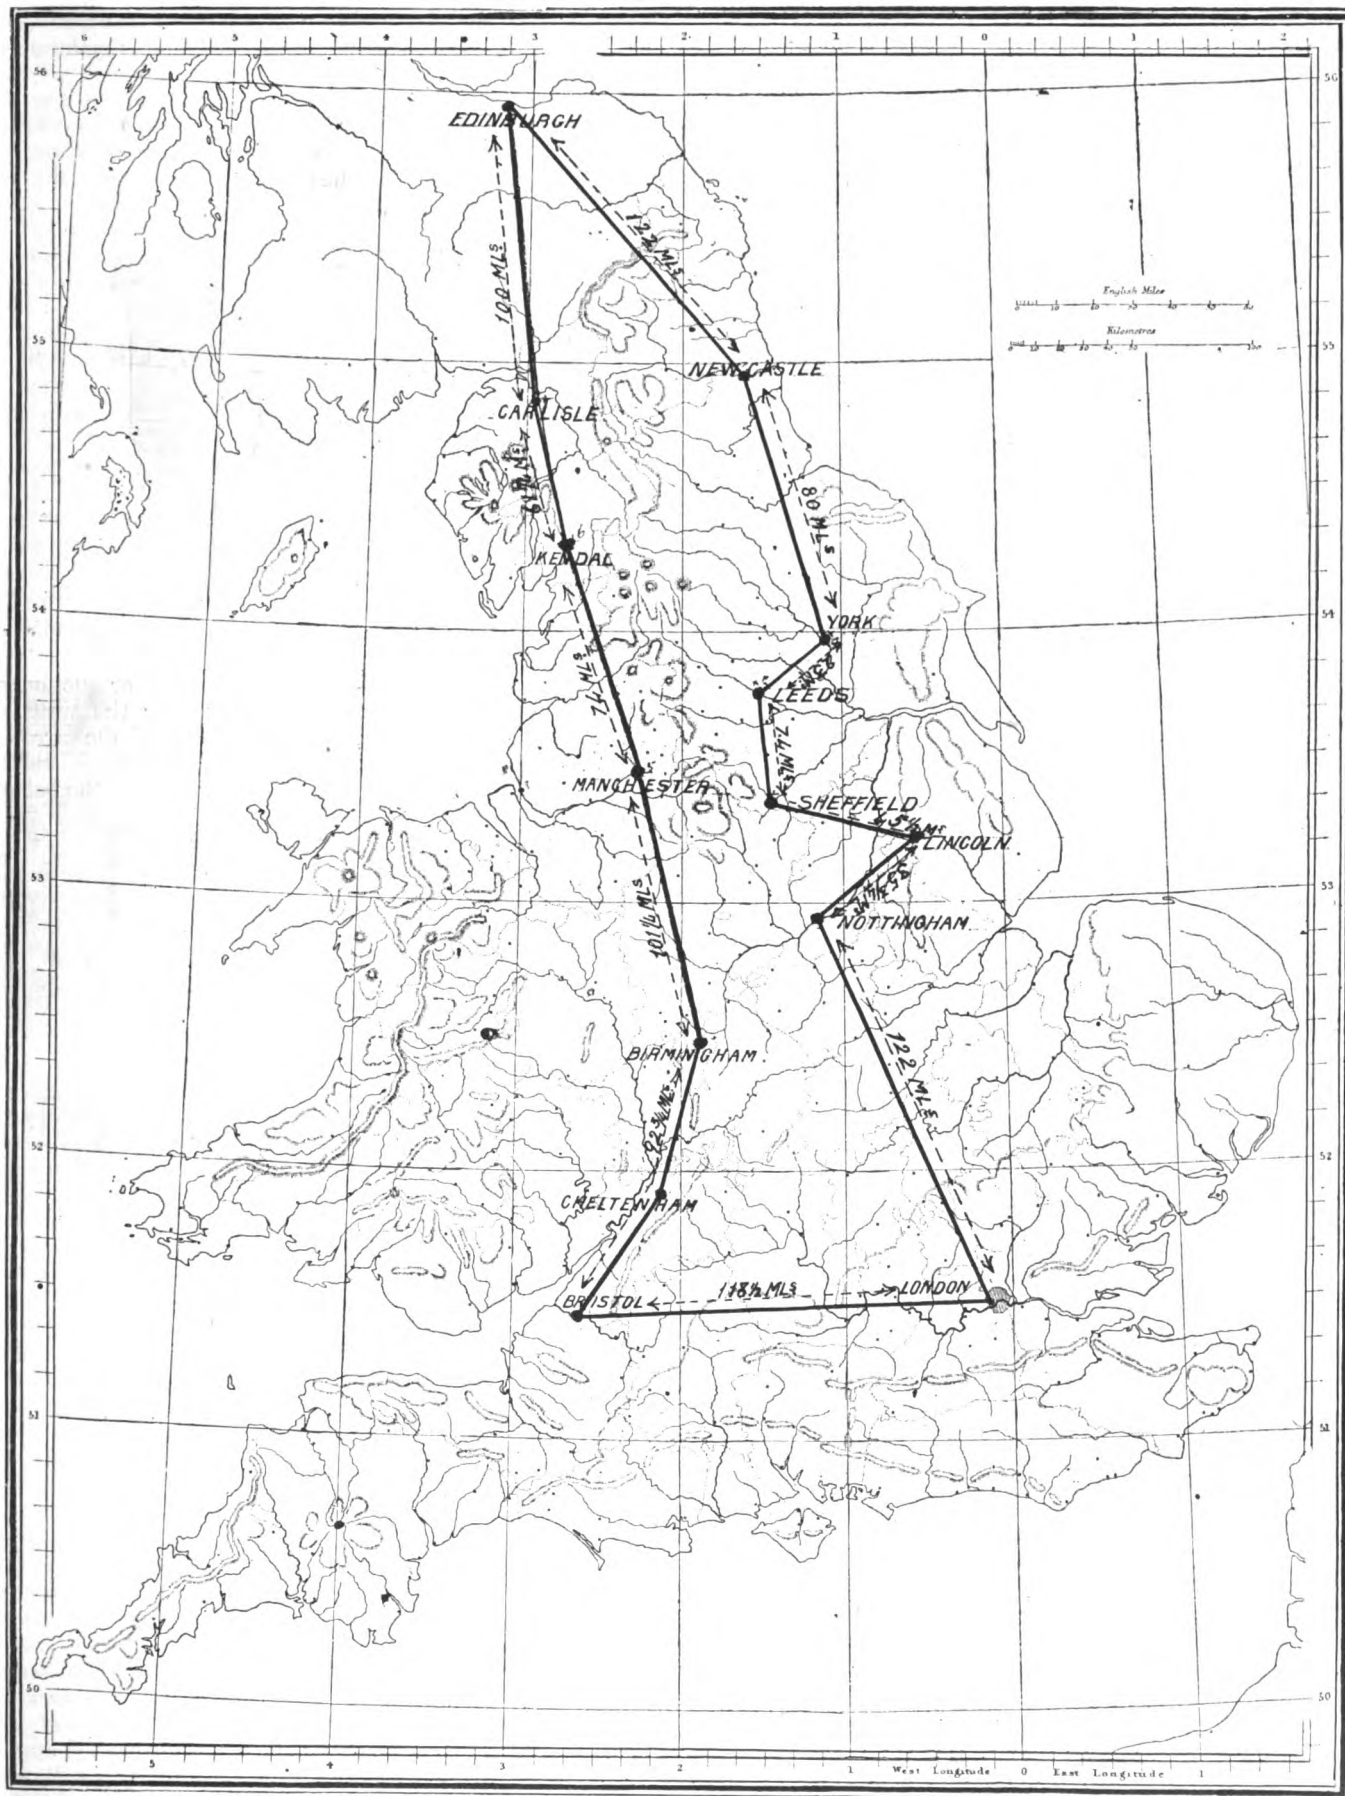

mounted on a steel frame, and wooden wheels shod with pneumatic tires. Three speeds forward—8, 16, and 32 kilometres per hour—and a reverse motion are provided, the power of the motor being transmitted by pinions to a countershaft, and from the latter to the rear road axle by a single centrally-located chain. Tiller steering is provided, while there are hand-brakes on each of the rear wheel hubs, controlled by a hand-lever at the side. Messrs. Wilford are said to be at present engaged on the construction of a 35-h.p. racing car. The motor with which it will be fitted is a four-cylinder one with electric ignition and special water-cooling arrangements.

WE learn that the Automobile Club is arranging for a British handicap section in the Paris-Ostend race, which is to be run off on the 1st and 2nd September next.

THE important announcement is made this week that Messrs. De Dion and Bouton and Co., of Puteaux, are making a $2\frac{3}{4}$ h.p. air-cooled motor as the standard for 1900. We understand that the new engine will fit tricycles and "quads" made for $1\frac{1}{2}$ or $2\frac{1}{4}$ h.p. motors, but that no conversion of old into new patterns is possible; the motor must be new throughout.

THE Lincoln Motor Bus and Parcel Delivery Company, Limited, has been registered with a capital of £5,000 to acquire any cars, carriages, engines, or vehicles, whether propelled by oil power or electric traction, for the conveyance of persons and goods, and to carry on in Lincoln or elsewhere the business of carriers in all its branches. The first directors are W. S. White, J. D. Goy, W. C. Sneath, F. Higgs, J. W. Enderby, and F. Brown.

The Forthcoming 1,000-Mile Trial.

Outline Map showing principal Towns to be passed through, with distances between same.

SOME NEW FRENCH CARBURETTORS.

THE accompanying illustration, Fig. 1, gives a section of the carburettor devised by M. C. Le Blon and used on the Le Blon carriages in France. The inventor states that his device is intended, first, to remedy the defective conditions produced in ordinary carburettors, where, because of the tilting of the vehicles upon which they are placed, the action is rendered irregular; secondly, to mix the air and petrol under the best conditions. The apparatus consists of a conical chamber, *A*, which forms a reservoir for the spirit, and in which is immersed

FIG. 1.—THE LE BLON CARBURETTOR.

the float, *C*. At the lower end of this float is a rod, *d*, terminating in a ball, *D*, which rests on the lips of the conical tube *E*. This tube communicates with the main reservoir of spirit. The ball *D* contained in the tube and drawn vertically by the float, remains always in position, whatever may be the inclination taken by the carburettor attached to the vehicle, and independent of the vibrations or oscillations of the whole arrangement. It will be seen that the quantity of spirit entering the chamber *A* depends upon the buoyancy of the float *C*, and its "lift"; this

FIG. 2. THE DORE CARBURETTOR.

latter is controlled by the screwed spindle projecting through the cover on *A*. Connected with *A* by the joint, *K*, is a cylinder forming the mixing chamber, the upper end of which is in communication with a pipe leading to the suction valve.

At the side of this cylinder is a bell-mouthed chamber, having double walls; the space between the walls is in communication with a branch pipe from the exhaust, the hot gases from the exhaust flow round this space, heating the inner chamber and

escaping at *R*¹. The mouth of this bell is closed by two perforated plates; the outer one can be rotated so that the air supply can be given any desired adjustment, and as it enters it is heated and passes through *N*¹ to the inner cylinder. Within this is a conical tube, *M*, and an envelope, *N*, perforated as seen, the whole forming an injector. At the upper end of the cylinder, where it joins the suction pipe, is a series of baffle plates, *L*. The action is as follows:—Petrol flows into *A*, and is maintained at a

FIG. 3.—GENERAL VIEW OF ELGIN CARBURETTOR.

constant level by the float *C*. On the inhaust or suction stroke cold air enters through *O*, and in passing over the walls of the bell is heated. It follows the direction of the arrow, and simultaneously the petrol flowing through *L* meets it and a mixture is thus formed which is then sucked through the baffles, *L*.

FIG. 4.—SECTION OF ELGIN CARBURETTOR.

Fig. 2 illustrates another carburettor of French design and manufacture, which is now being introduced into this country by the London Autocar Company, of Gray's Inn-road, London, W.C. The illustration shows the device half the natural size: it will therefore be seen that it is exceedingly small, while its

weight is less than half a pound. The carburettor fixes on to the inlet elbow pipe of any high-speed motor, and is coupled direct to the supply tank. After the device is adjusted the mixture is regulated by the lever at the bottom. This carburettor is, we understand, being taken up in France by makers of motor-cycles etc., owing to its lightness and the small space it occupies.

Figs. 3 and 4 represent respectively a general view and section of a new carburettor for petroleum-spirit-motors which has lately been put on the market by Messrs. Eldin and Lagier, of 21, Place Bellecour, Lyons. The petrol passes from the storage tank by the pipe *F*, through filtering discs *H* to the constant-level tank *A*. As the float *B* in the tank *A* rises, the levers *D* operate on the pointer *C*, which extends into the mouth of the inlet pipe and, when the desired level has been attained, finally closes the latter. Under the suction stroke of the motor a charge of petrol is drawn along the pipe *I* to the spraying device *M*. The necessary air is drawn in at *K* and is mixed with the sprayed spirit, a further intermingling being effected by the wire gauze discs *P* through which the mixture has to pass on its way by the pipe *Q* to the explosion chamber of the motor. Provision is made at *G* for clearing out any impurities filtered from the petrol by the wire gauze disc *H*, while the quantity of spirit allowed to pass from the constant-level tank at each suction stroke of the engine can be regulated by means of the small hand-wheel *L*. A new departure is to be found in the mixing chamber, the walls *O* of which, instead of being of metal, are of thick glass, rendering visible the amount of petrol emerging from the spraying nozzle, and consequently, it is claimed, facilitating its regulation. The apparatus is being made in several sizes, one for motor-tricycles and three for motor-carriages.

SPECTACLES FOR AUTOMOBILISTS.

THE considerable development which has taken place in the motor-car movement has shown the extreme importance of providing safety spectacles which will protect the eyes against dust, wind, etc. A bad accident may easily be caused if the driver's eyesight should be interfered with or in any way impeded by any matter likely to get into the eyes.

Already quite a number of different types of spectacles specially adapted to automobilists' use are on the market, and to the number Messrs. Wallach Bros., of 57, Gracechurch Street, E.C., have just added the new one illustrated herewith, and which they

have named the "Evertrusty." The firm have sent us samples of the new spectacles, an inspection of which shows that they are made of a light transparent material resembling xylonite. They easily adapt themselves to the face, and are well ventilated, so as to prevent the eyes from getting heated. We are informed that the spectacles have been adopted by many motor-car and cycle owners in France. They are supplied in a variety of shades, viz., transparent colourless, green, red, smoked grey, blue, pink, and in view of their relatively low price English *chauffeurs* will no doubt be inclined to give them a trial.

THE following gentlemen have been appointed judges for the forthcoming 1,000-mile trial:—Mr. W. Worby Beaumont, Professor C. Vernon Boys, Mr. Dugald Clerk, Mr. Bryan Donkin, Professor Hele-Shaw, Major H. C. L. Holden, Sir W. H. Preece, Professor Boverton Redwood, Sir David Salomons, Mr. James Swinburne, Professor William Unwin, Professor D. S. Capper, Professor Hudson Beare, Professor Archibald Barr, and Mr. A. F. Yarrow, the five latter gentlemen having consented to serve in addition to the ten members of the Automobile Club above-named, who acted as judges in connection with the Richmond Show.

AN AUTOMOBILE TRIP FROM VIENNA TO PARIS.

COUNT STEFAN GYULAI made a most interesting journey last September from Vienna to Venice and back. His vehicle was an 8-h.p. German Daimler. From Vienna he journeyed through Lower Austria, Steiermark, Krain, Carinthia, Goerz-Gradiska to Venice and back by way of Upper Italy and the Southern Tyrol. The distance covered was 1,630 kilometres, the journey from Vienna to Mestre, opposite Venice, being 696 kilometres. This part of the journey was covered in 29 hours, an average of 24 kilometres an hour. The 179 kilometres from Goerz to Mestre occupied 6½ hours; an average of 25 kilometres an hour. From Bruck to Gratz 53½ kilometres were covered in 1 hour and 47 minutes, an average of 29 kilometres an hour. From Gratz to Marburg 66½ kilometres were made in 2 hours and 30 minutes, an average of 26 kilometres an hour. From Cilli to Laibach, 47½ kilometres in 2 hours and 45 minutes, the average was 27 kilometres an hour. From Mestre to Bozen was 267 kilometres, from Bozen to Toblach 104½, Toblach to Klagenfurt 195, Klagenfurt to Semmering 217, Semmering to Vienna 89, an average for the whole of 22 kilometres an hour. The distance from Toblach to Vienna, 501 kilometres, was made in 23 hours. The Count, who was accompanied by the director of his estates, Herr von Lukacsy, of Arad, drove the car himself. They were attended by one servant. They met with no accident or interruption beyond a slight delay caused by a hot bearing between Padua and Vincenza, due to insufficient oiling. No difficulty was encountered in surmounting the Semmering pass, 950 metres above sea-level, and the still higher Berhauer Sattel, 1,250 metres in altitude. The roads were good for most of the way, and were exceptionally adapted to the automobile in the Tyrol and Steiermark. The carriage was covered, sheltering the occupants well. The weather, however, was favourable most of the time.

A CYCLE and motor exhibition is to be held in Leipzig from the 19th to the 23rd of October next.

THE St. George's (Hanover Square) Vestry have placed an order with the Thornycroft Steam Wagon Company for a motor-wagon.

ACCORDING to the Labour Correspondent of the Board of Trade for the Birmingham district, employment in the motor industry at Coventry "continues fair."

MESSRS. ELGIN AND LAGIER is the style of a new firm which has lately been formed in Lyons (21, Place Bellecour), with a capital of £5,200, to manufacture motors and to deal in motor-vehicles.

THE Manchester Motor Club intended to hold an opening run on Saturday last, the success of which was, however, interfered with by the severe wintry weather which prevailed. We learn, however, that two couples of members on quadricycles braved the elements and motored over heavy roads and through blinding snow as far as Knutsford.

AT the Edinburgh Police Court on Monday, Donald Mackenzie, motor-car driver, was convicted of driving a motor-car in a careless manner in Princes Street on the 27th February last, in consequence of which it came into contact with a horse yoked to a hansom cab and cut it on the breast. The Sheriff said he thought it was more an error than anything else, and inflicted the nominal penalty of 10s.

AMONG the latest additions to the list of members of the Automobile Club are: The Right Honourable Sir Francis Henry Jeune, and Messrs. H. White, J. B. Kerr, A.M.I.Mech.E., B. E. Dunbar Kilburn, J. O. Hickman, H. Dunkerdale, Harvey du Cros, jun., F. B. Cavan, A. Rosling, F. C. Baisley, M. D. Rucker, John S. Vivian Bickford, F. J. Gresham, R. A. Whytlaw, jun., B. H. Flint, G. H. Kahn, A. K. Smith, A.M.Inst.C.E., B. R. Banks, H. E. Hippisley, J.P., Llewelyn Thomas, T. H. Thwaites, G. Russell-Miller, R. J. Smith, C. Clifford Potier, F. G. Jonas, C. Burrell, jun., A. C. Edge, E. M. Liffe, W. Summers, H. S. Stoneham, and E. Manville, M.Inst.E.E.

THE MOTOR-CAR CLUB.

THE annual general meeting of the Motor-Car Club was held at the Club's premises on Wednesday evening, Mr. F. F. Wellington being in the chair. The statement of financial matters, presented by the hon. secretary, showed that expenses and receipts had not quite balanced, but only by a few pounds. Some of the members had failed to pay their subscriptions, which had thrown the treasurer out of his estimates. It was decided to strike off the defaulters from the Club's books in accordance with the rules. The recommendation of the committee, "That the club sanction the transfer of its financial business to a company, called the Motor-Car Club, Limited, and agree to pay all money received to the said company, on the understanding that in consideration of this arrangement, (1) The company will be responsible for all debts incurred. (2) The board of the company will be composed of five directors; at least two of whom will be nominated by the club," was unanimously agreed to, and it was decided that the consequent necessary revision of the Rules should be presented to the members at a future special general meeting. A full programme was decided upon for the year, including race meetings at the Crystal Palace on Easter Monday, Whit Monday, and August Bank Holiday, the races to be under Motor-Car Club's Rule. The meet and competition, which was so successful at the Crystal Palace last May, will be repeated, as will also the run to Brighton and banquet. A hill-climbing competition will be one of the features of the year's programme. Mr. H. J. Lawson was elected President for the year, Mr. F. W. Baily, hon. sec., Mr. G. H. Smith, reporting hon. sec., and Messrs. W. H. M. Burgess, Eason, Hart, E. J. Hill, C. Jarrott, McCormack, M. Moyle, W. Munn, C. Schofield, F. F. Wellington, A. J. Wilson, and C. G. Wridgway members of the committee.

THE AUTOMOBILE CLUB'S ONE-HUNDRED-MILE TRIAL.

It was announced some time ago that the Automobile Club would hold 100-mile trials every quarter. The first of these trials is to take place on the 11th April, in order that competitors may have the certificates gained thereat in time for attachment to their vehicles at the Agricultural Hall Exhibition. The following are the rules:—

Competition Rules.—This trial, having been announced prior to the 1st of March, does not come under the rules and regulations governing automobile competitions, but all competitions organised by the club (except the 1,000-mile trial) which are held subsequent to the 11th April, 1900, will come under the rules above referred to, and therefore all owners or drivers taking part in the competitions organised by the club, which are held subsequent to the 11th April, must have registered themselves and their vehicles as provided by Rule 17 *et seq.* of the competition rules and regulations.

Entries.—The trial is open to vehicles of manufacturers, agents or private owners, provided that they weigh under 30 cwt. unladen. Entries for the 100-mile trial must be made on a special entry form which shall be filled in and forwarded to the treasurer's department of the Club, on or before Saturday, the 31st inst., or Saturday, 7th April, at twelve noon as provided below.

1,000-Mile Vehicles.—It is hoped that all vehicles which have been entered for the 1,000-mile trial will be entered for the 100-mile trial.

The entry form of each vehicle must be accompanied by a cheque for 3 guineas in respect of each vehicle which has been entered for the 1,000-mile trial, and 6 guineas in respect of each vehicle which has not been entered for the 1,000-mile trial.

Vehicles entered after 12 noon on the 31st March may be entered up to 12 noon on Saturday, April 7th, provided that the proper particulars are furnished by that hour, and that a payment of £4 14s. 6d. be made in respect of 1,000-Mile Trial vehicles, and £9 9s. in respect of other vehicles is made.

Start.—Vehicles taking part in the trial shall be at a point in London, W., to be hereafter indicated, on Wednesday, April 11th, not later than 10.30 a.m. Any vehicle arriving later will be subject to disqualification. The vehicles will be started in their order of entry.

Route.—The route will be *via* Uxbridge, Beaconsfield, and High Wycombe, to the 52nd mile-stone from London and back again without stopping.

Speed.—No speed in excess of 12 miles an hour will be recognised. Controls will be established, within which no speed in excess of 8 miles an hour will be permitted, and within these controls a competing vehicle may not pass another vehicle in front of it, provided the leading vehicle is travelling at 8 miles per hour. Infringement of this rule will subject the competitor to disqualification and loss of entrance fees. A competitor may not pass a vehicle on a down grade provided the vehicle in front is travelling at not less than 12 miles an hour. The trial will include two hill-climbing trials—namely, Dashwood Hill, and on the return journey Ashton Hill. If any competitor be stopped by the police on a charge of furious driving, and the judges, on inquiry, think the police were justified in their action, the competitor may be disqualified by the judges; also, if he is guilty of inconsiderate driving.

Certificates.—The certificates will be issued by the judges prior to the opening of the club's exhibition at the Agricultural Hall on the 14th April; on them will be stated the following records of the trial:—Number of passengers. Average miles per hour not exceeding twelve miles. Number and causes of stoppages. Average cost per mile for fuel. Quantity of water used. Average speed in ascending the two hills.

Passengers.—In every vehicle having more than one seat, one seat

shall be placed at the disposal of the club for the conveyance of an official observer. Every vehicle shall carry its full complement of passengers, or equivalent weight (other than spare parts or tools) to give an average of 10½ stone per person. The passengers (other than the official observer) or weight to be provided by the owner of the vehicle. Vehicles having no seat except one for the driver shall run under the observation of club observers and obey their directions.

FURIOUS DRIVING CASES.

At the Birmingham Police Court last week, Mr. W. Lanchester, motor-car manufacturer, Ladywood Road, was fined £5 and costs for having furiously driven a motor-car in Broad Street on March 3rd. Police-constable Fish and Police-sergeant Amphlett stated that defendant travelled at a rate of from twelve to fourteen miles an hour. Many persons had to race out of the way of the car. Later in the day a constable shouted to the defendant, but he refused to stop. The defence, conducted by Mr. Staples Firth (London), was that the pace did not exceed nine or ten miles an hour. The maximum speed was only thirteen miles.—Mr. George H. Lanchester, brother of the last defendant, was fined 40s. and costs for having furiously driven a motor-tricycle on the same date.—Mr. W. Neale, Clarendon Road, Hagley Road, was also ordered to pay a similar amount for having furiously driven a motor-cycle in High Street on March 7th.

Herbert Lytle, the driver of Mr. Harmsworth's "Lifu" steam motor-car, which is used for the conveyance of newspapers, was summoned by the City police for driving a motor-car along Cannon Street at such a speed as to endanger the lives and limbs of foot passengers. The evidence of the policeman was to the effect that while proceeding along Cannon Street the driver formed a third line of traffic in endeavouring to pass other vehicles, in consequence of which he ran into a brougham coming in the opposite direction and damaging the hind wheel. After the officer had given his evidence he was subjected to a telling cross-examination by Mr. Staples Firth for the defence, and ultimately the court dismissed the charge. There have been a good many prosecutions of motor-cars in the City, and the police seem to have got their hands in, but we hope this will have the tendency to check their unreasonable attitude towards motor-cars.

We understand that Mr. W. Lanchester is appealing against the decision of the magistrates in his case.

Hearth and Home has become quite a convert to the automobile; no less than six pages were devoted to the subject in one of its recent issues.

THE Lancashire Steam Motor Company, of Leyland, are at present engaged in putting the finishing touches to a steam lorry for the Kidderminster Corporation.

IN the Lord Mayor's procession at Dublin on St. Patrick's Day a motor-car figured in connection with a series of carriages, etc., illustrating the progress made during the century in methods of road locomotion.

It is stated that Messrs. Prinetti and Stucchi, of Milan, Italy, are building a special racing car for Baron Albert Franchetti. The car will be fitted with a 16 h.p. two-cylinder motor, and will, it is said, be geared up to a speed of forty miles per hour.

THE Aachener Stahlwaarenfabrik (vormals Carl Schwanemeyer), of Aix-la-Chapelle, Germany, are going extensively into the motor-car business, the department being under the management of Herr Gaslin, who for about nine years was with the firm of Messrs. De Dion and Bonton.

ONE of the most indefatigable *chauffeurs* in Belgium is Baron de Crawhez. He is at present on his way back from Algiers, where he has been spending the winter, and where the roads, according to the Baron, are deplorable—in fact, scarcely more than beaten paths in many districts.

THE Automobile Association, Limited, consider that they have made a record in the sale of motor-cars in this country, as between the hours of 11 a.m. Wednesday, the 14th inst., and 6 p.m. Thursday, the 15th inst., they inform us they sold no less than thirty-five De Dion voiturettes and one car of another make.

OUR Midland correspondent writes that he had the opportunity the other day of seeing Jelley's motor-tyre detached and attached to the rim. The operation was performed easily and very successfully. "To my mind the most important feature of the tyre is the great width of the base, which must of necessity reduce lateral play to a minimum, thereby giving stability and rigidity to the tyre when fully blown up. The tyre is now on the market, and I understand that Tyres, Limited, Much Park Street, Coventry, have already had a number of inquiries for samples."

COMMENTS.

AS the date of the forthcoming 1,000-Mile Trial draws near the interest of the public is growing, while it becomes increasingly useful as a topic for conversation among motorists. All the preparations are now well in hand, and probably more than one hundred vehicles will set out on the morning of the 23rd prox. The latest time for receiving entries is rapidly approaching, and we would urge those who have not yet decided on taking part in the Trial to quickly make up their minds. The

success of such an enterprise must depend upon two things, firstly, the arrangement of a well-thought-out programme, and secondly, keeping to its details from start to finish. All automobilists should bear these facts in mind, so that the strain upon the club officials may be reduced to a minimum, and everything go smoothly and pleasantly. Hence the primary necessity of being in good time with entry forms.

The Forthcoming 1,000-Mile Trial.

ONE of the latest entries in the forthcoming 1,000-Mile Trial is a car by the Star Motor Company, Limited. Mr. C. Johnson, the secretary of the Automobile Club, informs us that an alteration has been made in the route from Buxton to Manchester, viz.:—Instead of passing through Whaley Bridge, Disley, Stockport, and Longsight as originally intended, it is now proposed to proceed *via* Burbage, Broken Cross, Monks Heath, Alderley Edge, Wilmslow, Handforth, Cheadle, Didsbury, and Chorlton into Manchester. After a careful review of the two routes the latter has been found preferable.

The Provincial Arrangements.

THE various committees which are carrying through the local arrangements are making good progress with the work in hand. Mr. F. M. Newton, the secretary and treasurer, informs us that a special meeting of the committee of the Scottish Automobile Club was held in Edinburgh on the 22nd inst. to consider the arrangements in connection with the Trial. The cars will leave Carlisle on the morning of Wednesday, May 2, with stops at Lockerbie, Peebles, and Penicuik, to reach Waverley Market, Edinburgh, during the afternoon. An exhibition will be held there during the whole of Thursday, and the cars will start again on the return journey to the south on Friday morning. A staff of about thirty will be told off to register the times of arrival and departure at the various stopping places, and to guard the portions of the road where the regulations issued to the drivers require lesser speeds to be maintained for certain distances. The arrangements for the Waverley Market have all been made, and the cars on their arrival will go to specially appointed places to be cleaned, and thereafter be brought into the market and stand there over-night. The exhibition will take place next day,

May 3, and it is proposed that in addition to the exhibit of the cars, races should be organised so as to bring as attractive a programme as possible before the public.

Entrance Fees must be Paid.

It ought to be distinctly understood that entrance fees are required from all participating in the forthcoming trials. Seeing that the whole of the details of organisation with the attendant expense will fall upon the Automobile Club, that institution naturally exacts a fee from all entrants, and those who intend taking part should remit their entrance money as early as possible. It is rumoured that some firms are contemplating sending their vehicles over the course at the same time as the trials take place. If this is so, it is to be regretted as showing a want of consideration for those who have promoted the trials, and also seeking an advantage without reciprocal support to the Automobile Club. More than that, owners who thus avoid the entrance fee will place themselves and those who accompany their cars in a very unfortunate position, and we hope, for the credit of the industry, that only those who have qualified will be found with the vehicles during the trial. Certainly any such intention as that to which rumour has given currency is to be deplored.

Automobilism on the Stage.

A FEW weeks ago we gave an illustration of two artistes on the stage of a New York music hall who careered on their "Autogo" to the delight of crowds and the profit of the management. Now the motor-car has appeared on the stage of the London Alhambra, and with such an expert driver as Mr. E. J. Coles on board the audiences at that place of entertainment have this week been given a demonstration of driving which should convince the least favourable critic that the car is absolutely under control and is not the wayward combination of eccentricity that some people have imagined. To drive a vehicle on a level road is one thing; to manipulate it between flags placed on a limited area is another, especially to one whose work has been on the public highway and not on a stage, to the accompaniment of a band and in the full glare of the foot-lights.

Mr. Coles, Motor Expert.

ON Monday the inaugural performance took place, Mr. Coles appearing in the ordinary attire of a motor-car driver. His car was a Benz, fitted with Crypto gearing, and it ran absolutely silently throughout the performance, which lasted eight minutes—all too short for the many automobilists who were present, one devotee of the motor-car coming from Scotland to see the first motor-car performance on the English stage. A slope had been arranged with a gradient of one in four, and up this went Mr. Coles, coming down backwards—although the car was not provided with a reversing gear. Elsewhere on the stage was a flight of stairs, the gradient here being one in 3½. The descent was accomplished easily and silently, and then we were treated

to a series of clever evolutions between flags placed at such distances apart that one only inch on each side separated the car from the flags as it turned in and about. The slightest miscalculation would have displaced the limit flag. One of the most interesting features of the performance was when Mr. Coles, alighting quickly, let the car continue to negotiate the maze-like course alone.

Demonstration of Control.

DURING the week the performance has been continued, being lengthened on the second and subsequent occasions. Mr. Coles will repeat his feats as he has been offered a four weeks' engagement, and automobilists who are interested in seeing what can be done with a motor-vehicle under the control of an expert will doubtless wend their way to the Alhambra. Long runs and trials along country roads may demonstrate speed and endurance; but such a display as that given by Mr. Coles is equally valuable as showing how perfectly the machine is under the direction of the man with a clear head and a steady hand—two essentials to successful driving of horses and automobiles alike. Not only has the general public shown its appreciation of the performance, but during the week motorists have been present in large numbers, and on most evenings thirty or forty well-known automobilists were to be seen critically admiring the performance which will probably be seen at the forthcoming exhibition at the Agricultural Hall. During the time he is on the stage Mr. Coles uses less than a quart of petrol, and readers will smile when they learn that he is watched by two firemen carrying a wet blanket!

Magistrates and Motor-Cars.

THAT two cases of alleged furious driving of motor-cars should, in the course of a single week, be dismissed by magistrates is a matter worthy of comment, especially in view of the many cases where automobilists have been mulcted in fines notwithstanding that witnesses were brought forward to disprove the statements of the police as to the alleged excessive speed. The first case was that reported in our last issue, where Mr. H. Lytle, the driver of Harmsworth's "Lifu" steam car, was summoned for driving a motor-car at such a speed as to endanger the lives and limbs of pedestrians. Thanks to the telling cross-examination of Mr. Staplee Firth, the Court ultimately dismissed the charge. The second case was that of Mr. Joseph Lisle, who was summoned at Wolverhampton for driving a motor-car at a greater speed than was reasonable and proper, to the common danger of pedestrians. The stipendiary, while holding that the speed was unreasonable, assuming that the evidence of the police officers was correct, dismissed the summons on the ground that there was no proof of pedestrian or vehicular traffic on the highway at the time. In connection with this matter we are glad to be able to report that the membership of the recently formed Motor-Vehicle Users' Defence Association is steadily increasing. We recommend all automobilists to join the association, which is destined to prove of great benefit to users of motor-vehicles, who, owing to the present attitude of many members of the police force to the new method of locomotion, are always open to have summonses issued against them for alleged furious driving.

Chief Constables and Automobiles.

THE interest of constabulary officers and important police inspectors in automobilism is not merely limited to stopping the drivers of cars and summoning them before the local bench. Nor does it universally find vent in the manner of the Chief Constable of Lincolnshire, who has instructed his watchful men to be particularly keen on motorists returning to London in the 1,000-mile Trial. Some, like the Chief Constable of Barnsley, seek a closer acquaintance with the automobile rather than the automobilist, and lose few opportunities of testing its reliability and speed for themselves. Barnsley's Chief Constable has been having a trip on a Marshall car, and at the conclusion of a run of fourteen miles expressed surprise at

its steadiness as well as the thorough control which the driver possessed over the vehicle.

Educating Public People.

WHEREVER motorists are acquainted with police authorities, country magistrates, or public men of any sort, they should always be willing to take such gentlemen for trips. In fact they should even solicit them to become passengers in the interests of other automobilists as well as the industry. For a motorist never knows when he may have to appear in court at the instance of some imaginative policeman, and the more the magistrates and officials are acquainted with the main features of cars and with their capacities, the more likely is justice to be secured. Now that the spring season is approaching we would again urge readers thus to popularise the pastime and, at the same time, extend a knowledge of the sport among people who have authority—and who have, at present, to exercise it with only meagre knowledge of some of the subjects with which they have to deal.

A Doctor Defends Automobilism.

A CORRESPONDENCE has been going on in the *Surrey Comet*, the tone of the original letter being decidedly averse to motor-cars. But Dr. W. W. Hardwicke, of East Molesey, has entered the fray with an interesting letter, which should have a good effect in the county. After impressing upon horse-owners the necessity of training their animals to decent behaviour when near a motor-car, he raises a point which is often overlooked, viz., that drivers are often more nervous than the horses they drive. It is a common thing to see a nervous driver, on spying a motor-car advancing, suddenly excite him or herself, jump out of the carriage and rush to the head of the horse, who takes no notice whatever beyond a passing glance and look of wonderment as to what all the commotion is about. Dr. Hardwicke addresses a few words to those who attack the motor-car which are worthy of extended publicity. "If the horse," he remarks, "is to remain on the roads as an integral portion of the traffic—which he undoubtedly will do, notwithstanding the rapid development of mechanical locomotion—owners must be content to take a place amongst the various other kinds of locomotion which the advancement of the times has evolved. The motor-car has as much right on the road as admittedly dangerous horses. . . . The motor-car causes no wear and tear to roads, and is the cleanest of travellers, leaving nothing behind but a trifling passing smell of not unwholesome gas; whereas a horse scatters a road with dung, the smell from which in hot weather is not only more offensive than petrol, but is detrimental to health, for it undergoes decomposition in wet weather, and in dry weather it is inhaled in the form of dust. If a car comes to grief it harms no one but the owner, for it stops, and is in no way dangerous to the public, for it does not shy, kick, rear, bolt, or commit itself in any other unmannerly way."

The Manchester Automobile Club.

THE first general meeting of the Manchester Automobile Club was held last week. Mr. W. E. Rowcliffe, who presided, said that the duties of the provisional committee were now completed. The nucleus club had been formed, rules for its future management had been formulated, and it was for the members to say if they approved those rules and of what the provisional committee had done. The members of the club now numbered something over forty well-known automobilists in and around Manchester. The election of officers and a permanent committee for the ensuing year was then proceeded with. The provisional committee thought it wise to leave the election of president and vice-president in the hands of the new committee, who will also make all the local arrangements for the 1,000 mile Trial next month. A fund to guarantee the expenses of the local exhibition in connection with the event has been organised. The rules having been approved, the following were elected as the committee and officers:—Messrs.

George P. Dawson, Prestbury ; Frank Gresham, Stretford ; James Lowe, Sale ; Benjamin Marsden, Heaton Chapel ; Samuel Okell, Bowdon ; Victor F. O'Neill, Castleton ; Ludlow P. Perkins, Whitworth Park ; Daniel H. Simpson, Cheadle Hulme ; A. Mac-killop, Didsbury, hon. treasurer ; W. E. Rowcliffe, Alderley Edge, hon. solicitor ; J. Hoyle Smith, Eccles, hon. secretary.

Hong-Kong or Holborn.

RAPIDITY in locomotion is one of the great wants of the age ; and the function of the motor-car will be to give speed where slowness of movement is now the rule. But even the automobile, or those who chronicle its progress, can be credited with too exciting tasks. This reflection comes after reading in a contemporary that "M. Lehweß has reached Hong-Kong, from which place he will journey by automobile to Paris." This will probably be news to Dr. Lehweß as it certainly was to ourselves, for, as we mentioned last week, he has lately been startling Londoners with his shoe-shaped racing car. We are always pleased to hear of record runs, but this latest ride is beyond our comprehension. Probably our journalistic confrère saw the announcement that Dr. Lehweß intended to go to Pekin, and during a dream thought of Pekin and imagined the rest.

Mecaniciens Wanted.

THE suggestion that *mécánicos* should be given an opportunity of having their abilities tested is not a new one ; but it is none the less valuable. As the industry develops there will be a splendid prospect for the young engineers who have ambition to become engaged with owners of motor-cars. Country gentlemen will require men who can both drive and overhaul their cars, and there will be a good opportunity for young engineering fitters to specialise in this class of work. It should prove interesting to many who, possessed of the necessary mechanical bent, prefer outdoor employment to indoor work.

Repairing the Main Roads.

OFTEN have we urged that the progress of the automobile would be attended with a simultaneous improvement of the main roads of the country, and although many of the local authorities have been unkindly critics of motorists, others have shown a desire to facilitate their movements. But probably the most notable instance of the kindly consideration of a local authority has occurred in the north. The Durham County Council is informing some of the lesser boards within the area of its jurisdiction that a motor-car trial is to take place on the main road between the 23rd prox. and May 12th, and requesting that the road be put into good repair. The County Council having shown such a desire to assist automobilism should have been sufficient to have incited the district councils to a desire to put the road in order, so as to give the forthcoming trial a fair chance. Not so, however, the council at Ledgefield, which, rather churlishly, has ordered the letter to lie on the table. We record the incident as typical of what any new movement may expect from many of these pettifogging little bodies, while the enlightened policy indicated in the appeal of the County Council may be regarded as evidence of the more tolerant attitude assumed by those with larger authority and ampler knowledge.

The Monthly Comparison of Accidents in France.

THE statistical table of accidents caused during the month of February by horses, automobiles, and bicycles does not differ from those previously published by *Le Vélo* in exemplifying the increase of safety secured by the employment of mechanical means of transport. During the month the noble steed has wrought considerable mischief, for no fewer than 757 accidents can be laid to his charge. Deaths to the number of 57 have resulted from these mishaps, while 700 persons have been more or less severely injured. As compared with this appalling list the 23 accidents occasioned by automobiles is all the more striking,

and especially so when it is noted that not a single fatality has to be recorded. As for the bicyclists—well, they are responsible for 43 mishaps, which have brought about the deaths of 4 persons and the wounding of 39 others. In this cycle category one very curious accident occurred. It came about on February 25th, at Saint-Ouen, a small town situated on the banks of the Seine, and the victim was a young apprentice in an engineering works. In passing on his machine by the side of the river he accidentally swerved and ran into a tree with such force that he was thrown from his cycle and fell into the Seine, where he drowned. We understand that *Le Vélo* proposes to add a fourth column to its figures, and commencing from April 1 will record the railway accidents occurring in France, so permitting of an easy comparison being made between the four great means of locomotion. Of course, it is hardly probable that these monthly compilations include every accident, but any that are overlooked are infinitely more likely to be those resulting from the horse's eccentricities than from the automobile's vagaries, for there is never any lack of publicity in the event of a motor mishap, whereas the noble steed

THE RECENT "COUPE DES VOITURETTES" RACE.—A GROUP OF AUTOMOBILISTS, INCLUDING M. CHARRON.

frequently indulges in murderous acts without any attention being paid to him. But then he is a horse, and that covers a multitude of sins.

Fenders for Automobiles.

AN inventive and enterprising genius of that enterprising country of invention and genius, the United States, has lodged a patent for fenders for automobiles. In appearance the suggested innovation is not unlike the cow-catchers used on some American railroads, although its design can be adapted to the fancy of the person who intends to adopt the idea. This is well calculated to prevent men, women, children, cows, sheep, and other forms of life being crushed beneath the automobile which happens to go their way ; but whether the concussion of a fender is less distressing than that of the "bonnet" of an ordinary automobile is a matter the inventor must determine—we shan't. The notion offers many interesting possibilities, and as the motor-vehicle is being adopted in connection with municipal work, its development in the collection of street refuse, mud, and other matters found in our public streets might be profitably considered. Thus the fender might be so formed as to scoop up the mud and transfer it through a hopper passing over the head of the driver into a receptacle at the rear of the vehicle. Some will ask, what will become of the mud passed over as the fender-scoop rose to the hopper ? That could be got over by the use of a second vehicle following closely behind the first, or letting some other genius try his hand at the problem. Certainly the man who could put a fender in front of a motor-car—just as though it were a nursery grate—should be taken up by some go-ahead municipality that wants to find a means of increasing the rates.

THE NICE WEEK.

(From Our Own Correspondent.)

THE automobile festivities at Nice commenced on Sunday last in magnificent weather with the "corso fleuri," which took place on the Promenade des Anglais and in the Jardin Public, and which scored an even greater success than that of last year. The scene was a truly brilliant one, for more than fifty gaily decorated automobiles participated in the *fete*, and the grand stands and enclosures were filled with all the fashionable world of Nice. Among the social and automobile celebrities who took part in the "défilé" and in the battle of flowers were noted the Marquis Massengy d'Auzac and the Comte Brunetta d'Usseaux, the Comte and Comtesse de La Ravellière, Mme. Dhasty, Mme. Bob Walter, Mr. H. Johnston, and many other automobilists too numerous to mention. The committee's regulation with regard to the decorations of the cars were carried out with praiseworthy impartiality, for both Baron Henri de Rothschild and M. Jellineck were not permitted to take part in the *fete*, their cars not being sufficiently adorned. After the jury, which consisted of the Duke of Leuchtenberg, Baron Zuylen, Baron Springer, Baron Arthur de Rothschild, Prince d'Essling, Prince Lubecki, Count Biscaretti di Ruffia, Sir David Salomons, MM. Biasini, Jacques Gondoin, Crossa, Camille Blanc, Albert Gautier, De Bary, Michel Dupré, and Falconnet had made their awards, the successful competitors received the handsome commemorative banners from the hands of the Duke of Leuchtenberg, who was accompanied by the King and Queen of Saxony and the Duke of Oldenburg.

Once the *fete* was over, the one all-absorbing topic of conversation was the possibilities and probabilities of the following day's races, and the more enthusiastic motor men occupied their time until a very late hour in watching the *coureurs* make their final preparations. Every *garage* was full, and in many the work of overhauling and readjusting the speed machines was continued uninterruptedly all night long. Rumours as to the non-starters were to be heard everywhere, but it was made known without doubt that neither Albert Lemaitre nor Baron de Turckheim would figure among the drivers of the big cars, while Osmont would be an absentee from the ranks of the cyclists. As to the general opinion regarding the ultimate winners, it may best be exemplified by quoting the betting, which was at even money for R. de Knyff, and four to one against Charron and Girardot. Among the motor-cyclists Béconnais and Marcellin were equal favourites at two to one against.

The first of the racing cars was timed to start at seven o'clock on Monday morning, but long before that hour a great crowd had assembled at the *contrôle de départ*, and they were treated to one most curious and exciting incident. M. de Knyff having descended from his car, the vehicle remained by the roadside, with the motor stopped, but lamps burning and driving gear engaged. As M. Gilles Hourgières drove up behind he ran into the back of it gently, but with sufficient force to set the motor running, and the famous winner of "La Tour de France" promptly proceeded to waltz down the road. Its career, however, was but a short one, for unaccustomed to promenade unguided by the strong hand of its master, the noble creature just ran itself against the nearest tree, and there waited to be taken home. No damage having been done M. de Knyff ranged up with the other competitors, who numbered twelve all told. Charron was the first to leave at seven o'clock exactly, piloting the new Panhard model for 1900, and he was followed by Girardot, who drove the car used by Charron at Pau. The two 24 h.p. German Daimlers of M. Mercedes, the second of them being guided by M. Brown, then moved off, followed by M. René de Knyff and M. Gilles Hourgières, the latter driving a 12 h.p. Panhard. They were followed by M. Levegh with his new Mors of 32 h.p., so quietly constructed in the Grenelle factory, Comte Boson de Périgord and M. Pinson, each mounting a 12 h.p. Panhard, and MM. Gui des Aunairs, Labouré and Kœchlin, the latter driving a 20 h.p. Peugeot vehicle. Ten minutes later, or at 7.15 a.m., Marcellin, the first of the motor-cyclists, started on the journey, and the others followed at half minute intervals. These others were :—

G. de Meaulne, Gasté, Béconnais, Baras, Ducom, Reboul, Cavasse, Jouan, Allègre, Gleizes, Bardin, Teste, Joyeux, Fernandez, Léonard, Renaux-Bonnard and Bectin. The last-named was riding a machine fitted with two motors, each of which is stated to develop 3½ h.p.; Marcellin was on his two-cylinder motor of Pau, while Béconnais rode his Soncin engine with a cylinder of 80 mm. and a stroke of 110 mm. The last of this category was allowed six minutes grace before the five voituresses were despatched, one by one, the whipper in of these leaving the *contrôle* at 7.27 a.m. At Cannes, thirty-one kilomètres from the start, M. Mercedes held a two minutes' lead from M. Girardot, M. Levegh being third, while of the motor-cyclists, Béconnais had secured an advance of five minutes on Marcellin. From that point M. Levegh, M. Charron, and M. de Knyff led in turn, but it was left to the latter, *le roi des chauffeurs*, to arrive first at Marseilles, his net time for the entire journey of 201 kilomètres over a most difficult and dangerous course being 3h. 25min. 30sec. When it is considered that in 1898, Charron, the winner on that occasion, took 6h. 53min. to cover the same route, the value of de Knyff's performance will be appreciated. But he did not have it all his own way, for Hourgières finished but six and a half minutes behind him, and he in turn was hotly pursued by Charron. But to give the complete classification, here it is :—

	H.	M.	S.
1. R. de Knyff	3	25	30
2. G. Hourgières	3	32	1
3. Charron	3	33	0
4. Pinson	3	44	32
5. Levegh	3	49	37
6. Périgord	3	52	47
7. Girardot	3	52	53
8. Kœchlin	3	59	35
9. Labouré	4	51	32
10. Mercedes	4	52	49

Of the motor-cyclists, Béconnais actually beat de Knyff's time by a couple of minutes, a truly marvellous feat. Over any route 201 kilomètres in 203 minutes would be an altogether exceptional performance, but the Nice-Marseilles course is of such a character that one is almost aghast at Béconnais' daring. The order at the finish in this category was as follows :—

	H.	M.	S.
1. Béconnais	3	23	11
2. Teste	3	44	25
3. Marcellin	3	46	11
4. Joyeux	3	51	32
5. Bardin	3	52	20
6. Gasté	4	25	5
7. De Meaulne	4	26	40
8. Baras	4	52	0
9. Allègre	5	0	7
10. Bertin	5	18	0
11. Cavasse	5	27	15
12. Ducom	5	55	58
13. Bonnard	5	56	33

The voituresses completed the course in this order :—

	H.	M.	S.
1. Clérissy	6	7	23
2. Dubois	6	39	50
3. Théry	7	14	25
4. Van Berendonck	7	25	17

No very serious mishaps occurred during this first stage of the race, the most exciting adventure being that which befell Gleizes at the Pont du Var. At this point the axle of his machine broke, and the cyclist was thrown into a ravine full of water, where undoubtedly he would have been drowned had not a witness of the accident promptly come to his aid. The second car, belonging to M. Mercedes, also came to grief, but the driver, M. Brown, suffered no injuries. Among the racers the only other mishap was that of Prenil, whose voiturette capsized owing to a burst pneumatic, but one of the amateur followers of the race, Prince Lubecki, in giving way to Charron, ran his car into a wall and broke the two front wheels.

Unfortunately for the ultimate success of the race the weather on the following morning was just too dreadful, and only seven competitors were bold enough, or perhaps one should say sufficiently foolhardy, to risk the return journey to Nice under racing conditions. These *coureurs* were Béconnais, Gasté, and G. de Meaulne of the motor-cyclist and Chauchard, Dubois, Théry and Van Berendonck of the voiturette category. The three motor-cyclists left Aubagne together, the voiturettes following them at half-minute intervals. As for the drivers of the big cars, it did not take them long to decide unanimously that racing under such conditions as those prevailing would mean the risk of serious accidents, and accordingly all ten signed a formal agreement to the effect that they abandoned the race at Aubagne, and that they were willing to abide by the classification of the first day. This formality concluded, they set out upon their return journey to Nice, breaking the run at Hyères for déjeuner. At this place de Meaulne was the sole cycle representative, and from that point onwards he had the race in his hands, eventually arriving at Nice after a journey of 7h. 26min. net. The big cars reached Nice at about 5.30 p.m., and then took place a lengthy conference of the commissioners as to the course to be pursued in awarding the prizes. Ultimately it was decided to make the awards on the basis of the first day's classification of the big cars, but to admit of no alteration to the original regulations for voiturettes and motor-cycles.

Concurrent with the Nice-Marseilles-Nice event there was decided the race from Nice to Draguignan and back, a *course* reserved for tourists. The distance each way was 96 kilomètres, and happier than the Marseilles competitor, the tourists succeeded in accomplishing the return journey before the heavier deluge of rain commenced. The classification at the finish was as follows:—

CLASS A.

Motor-cycles, motor-bicycles, and voiturettes not exceeding 250 kilogrammes.

	First day.			Second day.			Total.		
	H.	M.	S.	H.	M.	S.	H.	M.	S.
1. Florès ...	2	37	37	2	55	22	5	32	59
2. G. Richard...	3	13	27	3	5	46	6	19	13

CLASS B.

Voiturettes not exceeding 400 kilogrammes.

	First day.			Second day.			Total.		
	H.	M.	S.	H.	M.	S.	H.	M.	S.
1. Ravenez ...	2	34	47	2	19	42	4	54	29
2. Cornillean ...	3	11	3	2	38	17	5	49	20
3. Prenil ...	3	16	12	3	5	9	6	21	21

CLASS C.

Cars not exceeding 1,000 kilogrammes. 4 places.

	First day.			Second day.			Total.		
	H.	M.	S.	H.	M.	S.	H.	M.	S.
1. Chauchard...	3	31	25	2	14	6	4	45	31
2. Liebig ...	3	5	32	2	25	34	5	31	6
3. Cuénod ...	3	15	12	2	55	29	6	10	41

CLASS D.

Cars exceeding 1,000 kilogrammes.

	First day.			Second day.			Total.		
	H.	M.	S.	H.	M.	S.	H.	M.	S.
1. Stead ...	2	14	0	1	44	0	3	58	0
2. Valton ...	2	33	0	2	43	58	5	16	58
3. Bergeron ...	2	32	7	3	17	31	5	49	38
4. Audibert ...	3	0	33	2	51	19	5	51	52

The only striking occurrence in connection with this race was the time made by M. Stead's car on the return journey from Draguignan. To cover the 96 kilomètres of course in 104 minutes, with six people aboard the car, is pretty fast work, and the feat of making the last 32 kilomètres of the distance in twenty-six minutes would not disgrace any of the crack racers.

MR. W. F. PEARE, of Waterford, has just built a motor tricycle, the first turned out in Ireland, to the order of Captain Langrishe, of Knocktopher Abbey.

THE RAMUS VOITURETTE.

STILL they come is the cry with regard to motor-voiturettes of French construction. Herewith we give in Figs. 1 and 2 a general view and plan of the Ramus two-seated car just introduced by Messrs. Ramus Frères, of the Ateliers de Constructions Mécaniques, Chambéry (Savoie). The motor is of the horizontal single-cylinder type with electrical ignition and water-jacket. It is of 4-h.p., and runs at a normal speed of 1,200 revolutions per minute. The cylinder and combustion chamber are cast in one piece, while all the working parts are enclosed in a dust-proof cover and provided with automatic lubrication. The carburetor,

FIG. 1.—THE RAMUS VOITURETTE.

which is of a special type, there being no float, is attached direct to the combustion chamber. No pump is used in connection with the water circulation. A cooling coil is, however, provided (C Fig. 2) in the front of the car; the water tank has a capacity of 20 litres. Three speeds are available, the motor *A*, which is located in the fore part of the frame, transmitting its power by a single belt to a fast and loose pulley *DD'* on a short intermediary shaft *H* at the rear. This shaft carries three pinions of different size, any one of which can be brought into gear with corresponding pinions *F* on the rear axle. The latter is supported in four ball bearings. The change of speed is said to be effected without noise or jar, the belt being first shifted on to the loose pulley by means of a foot pedal. Steering is controlled by a hand-wheel, on

FIG. 2.—PLAN OF RAMUS VOITURETTE.

the standard of which are mounted all the control handles, with the exception of that of the variable-speed gear, which is actuated by the handle seen at the side thereof. The illustration shows a vertical steering pillar, but in future cars it is intended to make this inclined. The body is spring-suspended on a channel-steel frame; the wheels being of the cycle type shod with pneumatic tires. Two band brakes on the differential are provided, one controlled by a foot pedal and one by a hand lever at the side of the car. Messrs. Ramus inform us that their little vehicle can attain a speed on the level of thirty-five kilomètres per hour, and that it will mount gradients of one in eight at a speed of from eight to ten kilomètres per hour.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The Belgian Automobile Show.

THE eighth cycle and motor-car exhibition is to be opened at the Pole Nord, Brussels, on Saturday next, the 31st inst. The automobile display promises to be a most interesting one, the exhibitors including Messrs. Wilford et fils, of Tamise; La Société Générale Belge d'Automobiles; Le Progrès Industriel (Rumpf fils); Les Ateliers Germain; La Construction Liégeoise d'Automobiles; M. L. Linon; La Fabrique Nationale d'Armes de Guerre; Les Ateliers Dechamps; La Société des Automobiles Koch; Les Etablissements Pieper; La Syndicat pour la Construction des Moteurs et Voitures Gobron-Brilié; Les Ateliers Vivinus; La Compagnie Belge de Construction d'Automobiles, etc.

Fatal Accident.

SHORTLY before 1.30 in the afternoon of Friday last an electric cab belonging to the Compagnie Générale was being driven at a very moderate pace across the Place Ferdinand in the Ternes quarter of Paris, when the conductor noticed a lady directly in front of him. He sounded his horn and called out to the lady, who, in her sudden effort to get out of the way, unfortunately slipped on the greasy *paré* and fell right under the wheels of the cab. The vehicle passed over her and death was instantaneous. The victim has been identified as Madame Dourin, a widow lady, seventy years of age, who had for some time past resided in this quarter of Paris. Margat, the driver of the cab, is in the custody of the district Police Commissioner, pending an inquiry into the affair.

The "A.C.F." Club Roll.

THE total number of members of the Automobile Club of France is now 2,301, and additional candidates continue to arrive. On the 15th instant eleven new names were enrolled on the list of members, these being M.M. Comte Albert de Nioac, Baer, Georges Hamot, Marcel Collyn Dupresne, Louis Amiard, Baldon, Baron du Mesnil de Saint-Fiort, Géza Szarvady, Maurier Versèin, Mariano Acosta, and Edgard Lyon. Another recent election was that of Count Zborowski, a well-known member of the English club and owner of a 24 h.p. German Daimler. The growth of the club has been extraordinarily rapid and may well serve as an object lesson for other societies.

At Beziers.

MANY provincial automobile clubs are this year organising, for the first time, races, competitions, or *fêtes*, and in the great majority of cases there is evidently no lack of local support. One of the latest societies to announce its initial promotion is the Automobile Club Biterrois, which will organise a battle of flowers and floral *fête* for Tuesday, May 8th. The Place du Marché-Neuf at Béziers will be the scene of the festivities, and prizes to the value of £60 will be distributed among the owners of the most beautifully decorated cars, voiturettes, and motor-cycles, while every competitor will be presented with a banner as a souvenir of the occasion. No vehicles employed for advertising purposes will be eligible to compete, and the committee of organisation reserve to themselves the right to refuse the participation in the *fête* of any vehicle.

The Paris-Lille Race.

SUNDAY, April 29th, has been fixed as the date of this year's motor-cycle race from Paris to Lille, and once returned from the Riviera, *coueurs* will lose no time in entering their names for this event. The organisers, who are the proprietors of the Lille bicycle track, have not yet announced full details, but most probably the event will be decided on very

similar lines to those in force last year. Then, the start was effected from Châtou and a route of 258 kilomètres followed until Lille was reached, where the competitors wound up by covering five laps on the bicycle track. This year the prizes offered amounted to £42, of which £20 goes to the first man home.

Baron de Crawhez on Tour.

ALTHOUGH Biskra had previously been visited by an automobile the vehicle had never been driven right through from the coast, and it is by his successful accomplishment of this lengthy journey that the well-known Belgian *chauffeur* Baron Pierre de Crawhez has gained renown in the capital of the Zibans. The Baron is no stranger to automobile travelling in Algeria and Tunis, having already made many extended tours in these countries; indeed, it is doubtful whether any *chauffeur* has gone further afield on automobile expeditions than has M. de Crawhez. Interesting as Algeria undoubtedly is, it hardly an ideal country for motor-cars, as the roads are more or less imaginary, the actualities being mere beaten tracks.

The 100 Kilometre Record.

THE record-breaking mania now holds full sway in the breast of every racing motor-cyclist, and one after another of the leading *coueurs* makes his onslaught upon some existing figures. First we have Béconnais, or rather I should say we always have Béconnais, for he is more indefatigable in his pursuit of records than any other motor-cyclist, and is certainly more successful in this class of work than in actual races. Then we have Gasté, who a fortnight ago set up new figures for one and two kilomètres, and now it is Rigal's turn. His objective was to beat Béconnais' record of 1h. 46min. 12 $\frac{3}{4}$ sec. for one hundred kilomètres on the road, a record which has stood since May 14th, 1899, and which was accomplished in a race upon that date. Rigal's original intention to make the attempt on Thursday, the 22nd instant, having been frustrated by reason of the muddy state of the roads, the record man did not set out from Etampes until 11.15 on the following morning, when the general surface of the route was fairly dry but somewhat bumpy. Mounted on a Soncin motor, Rigal travelled at a tremendous rate of speed, and not being hindered by any untoward incident, he reached Chartres at 11h. 58min. 50sec., having thus accomplished the first 50 kilomètres in the extraordinary time of 43min. 50sec., representing an average speed of 68 kilomètres (42 $\frac{1}{2}$ miles) per hour. On the return journey to Etampes the record man had to drive against a fairly strong wind, and consequently he took some three minutes longer to cover the second 50 kilomètres. But he had an ample margin in hand, for upon pulling up at the finish he was sixteen minutes to the good, his actual time being 1h. 30min. 49 $\frac{1}{2}$ sec. This represents an average speed of 66 kilomètres 666 mètres (41 $\frac{1}{2}$ miles) per hour, and not only supersedes Béconnais' figures for the road, but also beats by 6 $\frac{1}{2}$ sec. the track record made by the same *chauffeur* on February 8th last at the Parc des Princes. Due notice of the attempt having been sent to the local authorities the route was kept fairly clear, and it is not a little due to this that Rigal's attempt was crowned with success.

AN overhead-conductor service, to be used for supplying electric power to ordinary motor-vehicles, has lately been tested in France. The invention is that of M. Lombard-Gerin, who proposes to run upon two parallel wires stretched on poles parallel to the highway a small motor-chariot carrying a long conductor, which passes to a trolley-pole on the vehicle to be operated. This conductor operates the motor on the vehicle, and it is long enough to permit very considerable freedom of motion in the vehicle. In the experiments made a 12 per cent. grade was mounted with ease, and the general results were considered sufficiently satisfactory to encourage further tests. The arrangement is illustrated in a recent issue of the *Genie Civil*.

THE MCINNERNEY MAGNETO-ELECTRIC IGNITION DEVICE.

It has been said that the best definition of a gas or petroleum spirit engine is a "spark with an engine built around it." The employment of an electric spark to ignite the explosive mixture in an engine was one of the greatest incentives to electricians to perfect batteries so as to give sufficient life to furnish at a minimum 150 sparks per minute without the engine missing. Great improvements have been made in the past few years in this type of battery, and then electricians and inventors gave their attention to sparking dynamos for similar purposes. Messrs. Thomas Kane and Co., of 64, Wabash Avenue, Chicago, U.S.A., have sent us the following particulars of a device they have recently put on the market, and which they have named the McInnerney Generator, and of which an illustration is given herewith. It consists of two parts, a permanent magnet and a keeper. The permanent magnet is preferably bolted to a part of the frame of the motor, and the keeper is attached to the fly-wheel, and the makers state that in the natural revolution of the engine it passes within one-sixteenth of an inch of the magnet in such a relative position that a spark is given inside the explosion chamber to ignite the mixture. The permanent magnet consists of a series of laminated plates, and in contact with each end is a pole piece consisting of a series of laminæ which are bent to a U shape, one limb in contact with the end of the permanent magnet, and the other limb projecting at right angles to the plane of the permanent

magnet, and having wound around it a coil of wire which connects with the coil upon the other pole piece and is in circuit with the sparking device. The keeper consists of a series of laminæ bolted to the fly wheel at any suitable point. In the operation of the engine the keeper first travels from the toe of the permanent magnet towards the pole end. In consequence of this arrangement there is practically a short circuit of the permanent magnet through the keeper as the latter travels over the magnet, which tends to remove the flux from the pole pieces. This lowers the flux in the pole pieces to the lowest practical extent, just prior to increasing it to a maximum, so that the rate of increase is very rapid, and as the generation of the current depends on the rapidity and magnitude of the change, currents of considerable energy are secured. As the change takes place during the passage of the keeper across the gap between the pole pieces and the ends of the permanent magnet, the time during which the change is developed can be varied by varying the extent of the gap so as to adapt the generators to motors in which it is possible to make variations in the timing of the sparking device.

It will be seen that the device has no moving or wearing parts. The passing of the keeper over the magnets strengthens them to their maximum point, and there is claimed to be no deterioration in use. The keeper is attached on the fly-wheel in such a relative position as to give the spark at the proper time inside the cylinder. If the engine is constructed with two or more cylinders, an equal number of keepers are required. While there is no change in the construction of the permanent magnet,

the generator is so constructed that the coils are water proof and the spark is not affected by oil or water. The current given by the device is claimed to be sufficient to give a spark to start the motor without the use of a battery at slow speed, and as the speed increases in velocity a larger spark is generated, so that it can be used on high-speed engines without any deterioration in its life. Messrs. Kane inform us that the generator has been submitted to the most severe tests, and that it has been successfully used for about two years on Otto and similar types of engines for stationary purposes and on marine and automobile motors of two and four cycle type.

It is reported in Paris that Messrs. Peugeot are about to introduce a new type of car, fitted with a vertical motor located in the fore-part of the frame.

AFTER a winter's rest, the motor-cars at Bishop Auckland are, we learn, running again, and appear to be as popular as ever with the travelling public throughout the town and district.

MR. W. H. BUXTON, 162, Portland Street, Southport, has been appointed agent for the Locomobile Company's steam-cars in the north-west of England.

MR. CRAMPTON, of Great Yarmouth, who is well known as a motor-tricyclist, has finally decided to abandon that form of vehicle and has purchased a Decauville car, with which he is delighted.

HERR ALFRED SCHOELLER, of the Fabrik Electrischer Messinstrumente, Frankfort-am-Main, has lately introduced a new series of pocket volt and ampère-meters. The former are made in sizes to indicate from three up to 250 volts, and the latter from one to thirty ampères.

WE have received a copy of a new catalogue just issued by Messrs. William H. M. Burgess, Limited, 9, Farringdon Road, London, E.C. It gives particulars and illustrations of the Marot-Gardon and Burgess motor-tricycles and quadricycles, the Burgess machines being fitted with the "Auto-moto" engine. The list also includes the Marot-Gardon $4\frac{1}{2}$ h.p. two-seated voiturette, fore-carriages, motors, tires, &c.

A NEW concern in the motor trade is the Service Motor Company, of 292, High Holborn, London, W.C. Mr. C. Clifford Potier, the proprietor, has sent us a copy of a new list he has just issued. In addition to the Allard motor-tricycle, for which they are sole agents in London, it gives particulars of the Phoenix motor-tricycle, the Components motor-tricycle and quadricycle, the Shaw motor-bicycle, the De Dion voiturette, and a large range of motor-car and cycle accessories. A couple of pages at the end of the catalogue are devoted to a useful list of automobile terms in English and French.

CALLING in at the depot of the London Autocar Company, Limited, in Gray's Inn Road, W.C., the other day we were shown a new vertical water-jacketed motor which, in view of its relatively low price, should meet with a large sale. It is of 3 h.p., and is fitted with electrical ignition. The engine is fitted with a very simple form of carburettor, and will work equally well with petrol or ordinary paraffin. The London Autocar Company are also now introducing the Jupiter float-feed carburettor. This device, which is suitable for use with motors of from 4 to 6 h.p., was illustrated in our issue of June 9th last.

THE New York *Wheel* states that "travelling at express train speed, two English motor experts rode motor-tricycles for several miles on the track at Berkeley Oval on Saturday the 24th ult. It was the first time that three-wheeled cycles had ever been used on that track, but the riders apparently experienced no more difficulty in making the turns than if they had been mounted on bicycles. Mr. Charles Jarrott and Mr. C. G. Wridgway, costumed in leather suits, were the riders, and both showed a skill in handling their machines that will be a revelation to motor-cycle riders in this country. For nearly ten miles the two travelled at a rate of about thirty-five miles to the hour, the high wind that swept the track making greater speed impossible.

THE DAIMLER MOTOR-CAR.

THE Daimler motor is now well known by the older class of *chauffeurs*, but as the ranks of automobilists have been greatly increased during the past few months, and are receiving additions at a rapid rate, there may be many who are not acquainted with the details of this largely-used engine to whom the accompanying illustrations, kindly placed at our

ments will be confined to the details. The motor, as will be seen, comprises two vertical cylinders, both water-jacketed and fitted with tube ignition. Two types are furnished as desired, one in which the petrol is supplied under pressure and one in which the feed is by gravity. Figs. 2 and 3 show respectively front and rear general views of the pressure-feed motor, in which it will be seen that the float feed and mixing chamber or vaporiser are attached direct to the top of the cylinders.

FIG. 1.—PART-SECTIONAL VIEW OF DAIMLER 6 B.H.P. PRESSURE-FEED MOTOR.

disposal by the Daimler Motor Company, Limited, will, no doubt, be of considerable interest. Since the late Herr Gottlieb Daimler first introduced his petroleum spirit-motor, with two inclined cylinders, it has been considerably improved and modified. In its present form, with vertical cylinders, it has given, and is giving, such satisfactory results that, so far as general outlines are concerned, the motor may be said to be now on a permanent basis, and that further improve-

Fig. 4 illustrates the gravity-feed type of motor, the float feed and vaporiser in this case being supported just above the fly-wheel and connected to the combustion chamber by a pipe. The various parts of the motor are so clearly shown in the part sectional elevation given in Fig. 1 that but a very brief description is necessary. This picture shows a section of the float feed and vaporiser, the pressure valve, the valve motion, and the cam gear. An enlarged view of the latter is also given in

The Daimler Petroleum-Spirit Motor.

(For Description see opposite page.)

FIG. 2.—FRONT VIEW OF DAIMLER 6 B.H.P. PRESSURE-FEED MOTOR.

FIG. 3.—REAR VIEW OF DAIMLER 6 B.H.P. PRESSURE-FEED MOTOR.

FIG. 4.—VIEW OF DAIMLER 6 B.H.P. GRAVITY-FEED MOTOR.

FIG. 5.—VIEW OF GOVERNOR AND EXHAUST-VALVE MOTION.

Fig. 5. In the pressure-feed motor the pressure in the petrol tank, which is located under the frame, is maintained by means of the exhaust. Reference to Fig. 1 will show that to the main exhaust pipe a short pipe is attached, to which is fitted a valve. Between the pipe and the valve a dirt filter or strainer is fixed. The function of this valve is to allow a small portion of the exhaust to pass through the pipe at each impulse of the motor, thereby keeping up the necessary pressure in the tank to force the petrol upward through the pipe. The valve also acts as an escape valve, being set to lift if the pressure becomes too great.

The charges are fired by means of incandescent tubes in direct communication with the explosion chambers. These are kept at a white heat by means of Bunsen burners fed under pressure. In order to prevent the over-running of the engine a neat form of governor is used. The governor acts on the exhaust valves, and when the motor exceeds its assigned speed keeps the same closed, and thus prevents any fresh charge of explosive gases from entering the cylinders. It will be noticed that the governor does not actuate both valve rods at the same time, the right hand valve rod being first operated upon. In this way, when running on a light road only one of the cylinders is used. The arrangement is, however, so sensitive that when the load is increased the other cylinder commences to work, and thus keeps the motor running at a regular normal speed. As already mentioned, the cylinders are kept cool by means of a water-jacket, the water being kept continually circulating from and to a tank by a small rotary pump. There are several other interesting features about the Daimler motor which we intend to refer to in our next issue. In the meantime we may add that all the working parts are encased, ensuring perfect protection against dirt, dust, and weather. While the motor is constructed as light as possible, every allowance is made for wear of the working parts, the general arrangement being such that that every part is accessible for inspection.

(To be continued.)

AN automobile patrol wagon has been built at Akron, O., and is said to be the first of its kind. The wagon weighs 5,500 lbs. and is equipped with two 4-h.p. motors. Its maximum speed is said to be twenty miles an hour.

THE Automobile Club of America has engaged the Madison Square Garden in New York for the first week in November next for an automobile exhibition. A track will, it is said, be built for demonstrations and speed trials of motor-vehicles.

THE Marlboro Automobile and Carriage Company, of Marlboro, Mass., have completed their first carriage. The power is steam, the fuel gasoline, and the seating capacity two or four persons. It weighs 900lbs., has 30-in. wire wheels and 2½-in. pneumatic tires.

LA SOCIÉTÉ DES MOTEURS GOBRON AND BRILLIÉ, of Boulogne sur Seine, France, are at present engaged on the construction of two racing cars. They are also building an 18-h.p. vehicle for M. P. Chauchard, who intends to take part with the same in the forthcoming race meeting at Turin.

THE Autocar Company, of Pittsburg, U.S.A., is moving into new works at Ardmore, Pa., near Philadelphia. The company has recently announced an advance in the price of its vehicles, the automobile previously quoted at £100 now selling at £130. The advance in the prices of raw material and labour are responsible for this change.

At a recent meeting of the Automobile Club of America it was decided to take action for the protection of automobilists who in storing motor-car spirit for steam or petrol motor carriages might come in conflict with the New York city authorities. The club will retain lawyers to defend any automobilist arrested for violation of the law.

FROM the Winton Motor Carriage Company, of Cleveland, O., we have received a copy of their new list of motor-vehicles which contains particulars of their productions and also copies of testimonials from a number of users. From the list we learn that in the 1900 model, the motive power has been considerably increased over the 1899 standard; the construction throughout has also been simplified, and the style generally improved.

CORRESPONDENCE.

—8—

THE EXHAUST BOX.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I am glad to see from your last issue that the Automobile Club of Nice have decided to prohibit the starting in any race of automobiles, be they cycles or cars, in which the silencer or exhaust box has been removed, and should be further pleased to see this rule adopted by organisers of race meetings on the track in this country. I was one of the spectators of the races on the Crystal Palace track during the course of the National Show in November last, and the awful din made by the dozen machines or so—all minus the silencer—will be long remembered by

St. Albans, March 24, 1900.

Yours truly,
SILENCER.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to know from any of your readers who have had any experience with the new Werner motor-bicycle: (1) if a continuous run of, say, forty miles at twelve miles per hour average, can be run without the explosion chamber getting dangerously hot or unworkable; (2) if so small an engine appears likely to last any reasonable time; (3) if it can be honestly recommended as a practical machine. I am thinking of purchasing one, but have had no experience in their running.

Ealing, March 26th, 1900.

Yours truly,
ENGINEER.

THE COMING MOTOR-CAR EXHIBITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I hope that valuable time will not be wasted at the forthcoming exhibition at the Agricultural Hall in tricycle races, which to my idea serve no purpose whatever, except perhaps to make prejudiced people still more down on motor-vehicles. The exhibition should be strictly confined to useful demonstrations of the utility of motors, and not given over to a few speed men to air their prowess to a select circle of admirers. The day of racing has gone; what is now wanted is good solid utility. Exhibitors have a perfect right to the whole of the exhibition to show their cars to the best advantage, and should at once protest against such a sheer waste of time.

Yours truly,
82, St. John Street Road, E.C., W. T. WARNE.
March 24th, 1900.

It is reported that the Hygienic Ice Company recently organised at New Haven, Conn., U.S.A., will introduce motor-vehicles for the delivery of its ice.

THE Mexican Electric Vehicle Company has been incorporated at Trenton, N.J., with a capital of £100,000, to operate electrical cabs in the city of Mexico.

A COMPANY has just been formed in Paris (49, Avenue de Maine) to be known as La Société Damas and Benoit, Société des Moteurs et Automobiles à Petrole, Columbia.

THE Denison Electrical Engineering Co., New Haven, Conn., it is reported, are building several omnibuses, to be propelled by 12-h.p. three-cylinder vertical petrol motors.

UNCLE ABE: Dem automobiles go so fast it 'ud take two niggers to tell about 'em. Sambo: How's dat? Uncle Abe: One ter say "Here she comes" an' one to say "Thar' she goes!"

THE commissioners of Baltimore parks have decided to admit all kinds of automobiles to the parks, provided the drivers first secure certificates of competence from the general superintendent.

MR. ALEXANDER WINTON, one of the representatives of the Automobile Club of America in the Gordon Bennett International Cup Race, will leave for France on May 5th, taking with him two racing cars.

A TRIP FROM KENDAL TO EDINBURGH.

LATEST ARRANGEMENTS FOR THE 1,000-MILE TRIAL.

By C. JOHNSON, the Secretary of the Automobile Club.

NO description has, so far as I am aware, appeared in your columns of what is probably the most interesting portion of the 1,000-mile Trial route both from a trial and a picturesque point of view. Owing to circumstances which have already been recorded in your columns, it was impossible to include the route from Kendal to Edinburgh in the inspection of the roads which was made at Christmas time. On hearing of this Dr. Dawson Turner, a member of the Automobile Club and one of the most prominent motorists in Scotland, kindly offered to drive me from Edinburgh to Kendal. The Club and those who are about to take part in the Trial owe a debt of gratitude to Dr. Dawson Turner for thus enabling the Club to indicate in its official programme carefully prepared instructions as to the turnings to be taken and other points of difficulty, seeing that on the road from Kendal to Edinburgh, especially in the wild moorland and hill districts which are to be traversed, it will be impossible to provide flags of direction. Dr. Turner was good enough to drive me from Edinburgh to Windermere and back, but for the purpose of this article it will suffice if a description of the arrangements at and road from Kendal to Edinburgh are given.

On Wednesday, the 21st inst., a meeting took place of the committee which has been formed at Kendal to undertake the arrangements there in connection with the Trial. Mr. Edward Boundy is acting as honorary secretary, and has been most energetic in forming the committee. The town council have granted the free use of their splendid market hall for the purpose of the exhibition of the trial vehicles at Kendal. It was pointed out at the meeting that if the vehicles are to ascend Shap Fell on the evening of their arrival at Kendal, and if on their return to Kendal they are allowed to be removed from the exhibition building for three hours for the purpose of cleaning, lubrication, etc., the exhibition, which is being looked forward to with considerable interest, would be more or less a fiasco. The committee were of opinion that the exhibition would be more attractive if the vehicles were seen in their uncleaned condition after they descend from Shap. It has, therefore, been decided that the vehicles shall remain uncleaned until the Tuesday morning, and that on the Tuesday morning breakfast shall be taken at Kendal before the start, that the vehicles shall be cleaned and lubricated from 6 a.m. till 9 a.m., and that the start shall take place at 9.30 a.m. The proposed stop at Ambleside for breakfast will thus be abandoned, and the day's run from Kendal to Carlisle will include only one stop, namely, at Keswick for luncheon, except the timekeepers' stop at Dunmail Raise.

On leaving Kendal, the road comprises a number of small hills, the first really steep one being Bannerigg, at the summit of which Windermere Lake is seen for the first time. There follows a magnificent run down for about $2\frac{1}{2}$ miles, but seeing that the road is at points precipitous, that it passes through Windermere town, contains many turnings, and is used by a fair amount of traffic, the rules provide that the speed should be limited to a maximum of 10 miles an hour, and that no vehicle shall pass another during the descent. If the morning be fine no one will regret that a moderate speed should enable them to enjoy a view of Windermere and the hills which surround it. The road passes through Ambleside and Grassmere, and shortly the long ascent of Dunmail Raise commences, but it will not be until Mill Bridge is reached that the hill-climbing contest will commence. From here to the summit is a distance of 3,013 yards, the average gradient being about 1 in 15. The road is, however, at points considerably steeper, and is reputed by the county surveyor to include 83 yards of 1 in $6\frac{1}{2}$. On the summit, which is about 780ft. above the sea, the county of Cumberland is entered, and, in descending, a sharp turn is made to the left in order that the vehicles may pass over the western road constructed by the Manchester Corporation, from which is obtained a fine view of Thirl-

mere. On the other side of the lake is Helvellyn (3,118ft.) This road by the side of Thirlmere is beautifully engineered. It twists and turns through cuttings made in the solid rock, and will require all the attention and skill of drivers; but in proof of the fact that it presents no serious difficulties I may state that Mr. Montague Grahame White, who had never seen the road before, drove me over it in the pitchy darkness of the night of Christmas Eve by the aid of the light of two candles only. There is some stiff hill-climbing between Thirlmere and Keswick, but, on the whole, the surface of the road is so excellent that the hills should present no difficulties to vehicles in which horse-power and weight are properly apportioned. The descent into Keswick is really very steep, but no one in their senses would be inclined to "rush it," seeing that there is presented before one a magnificent view of Derwentwater, Skiddaw, and the surrounding valleys and hills. From Keswick the road by Bassenthwaite is excellent as far as Castle Inn. From there to Bothel a moorland road is taken from which is seen in the distance the sea. After getting clear of Bothel the surface of the road into Carlisle, about 19 miles, is magnificent.

At Carlisle Mr. Hayton, a solicitor, and others are kindly undertaking the local arrangements. Application has been made to the markets' committee for permission to use the butter market for the exhibition of the vehicles. If this be granted on the evening of Tuesday, 1st May, the arrangement which has been made at Kendal will also obtain here, namely, that the vehicles shall not be removed from the exhibition building until 6 a.m. on the Wednesday morning; that breakfast shall be taken at Carlisle instead of at Lockerbie, and that the start from Carlisle shall take place at 9.30 a.m., thus enabling the timekeepers, by starting early, to arrive at Birkhill in ample time to take the records of the vehicles in the hill climbing competition there.

The road from Carlisle to Moffat, a distance of 40 miles, is truly magnificent. There is very little traffic on it, it is wide and straight. It has a fine surface, and the only hill worthy of notice is that at Ecclefechan. Scotland is entered on crossing the river Sark. From Moffat the character of the road changes, and very shortly becomes a winding mountain road, which leads to Birkhill. The road lies in a valley bordered on each side by many hills of over 2,000ft. altitude. If the morning of Wednesday, 2nd May, be fine, the road selected by Dr. Dawson Turner will here delight everyone. The scenery is indeed magnificent. The hill-climbing trial will commence at nine miles from Moffat, that is, two miles from the summit. In the first mile the road ascends 150 ft., in the second mile it ascends 300 ft., that is to say, an ascent of 100 yards in 1,760 yards. The gradient just before the summit is very steep, and in the opinion of those who have been over both hills Birkhill is considered worse than Dunmail Raise. The summit of Birkhill is 1,100 ft. above the sea. From the summit there ensues a splendid run down to St. Mary's Loch, which stands 730 ft. above the sea. Luncheon will be taken at the Rodono Hotel, which overlooks this loch. After luncheon a run along the loch and the River Yarrow will bring one to the Gordon Arms Inn and the County Police Station, from whence an ascent of 300 ft. follows with a run down to the valley of the Tweed, which is crossed at Innerleithen, and the course of which is followed as far as Peebles, where tea is to be taken. It should be stated that the run down from the top of the hills to the valley of the Tweed is made on a road which cannot be treated lightheartedly, inasmuch as it is divided from a drop into the valley beneath only by an earth barricade about one foot in height. From Peebles, the road, which has a good surface, passes through pretty scenery to Penicuik, after which place the surface deteriorates, but the scenery still continues interesting, as Arthur's Seat and the sea on the right come nearer, and a splendid view of Edinburgh is obtained.

At Edinburgh the committee of the Scottish Automobile Club are making arrangements for the exhibition of the vehicles at the Waverley Market, and they are also undertaking the time-keeping and flagging arrangements between Peebles on the one hand and Berwick-on-Tweed on the other. The secretary, Mr. Newton, has promised to go over the route next week with a view to securing that every detail is properly attended to.

The journey which I recently made with Dr. Dawson Turner was one of great interest, inasmuch as it took place at the time when, according to the original arrangements, the trial would have been actually in progress. It was thought by many that at

VIEW IN MESSRS. MARSHALL'S WORKS (see opposite page).

such a time the roads would have been in a bad condition, if not impassable. So far, however, as the roads between Kendal and Edinburgh are concerned, they happened to be in the best of condition. On Friday last Dr. Dawson Turner had to give a lecture in the morning at Edinburgh, after which we started, and completed the journey of eighty miles to Ecclefechan early in the evening. There was snow on the hills, but the roads were rapidly drying. On Saturday we drove *via* Carlisle and Bothel to Windermere, seventy-two miles, arriving there in time for luncheon a little after one o'clock. The roads throughout were in perfect condition. On Sunday we left Windermere a little before eleven, ascended Dunmail Raise, accomplished the competition portion of the ascent with three persons and luggage for three on board at 9 miles an hour, and proceeded by Bothel to Moffat, 93 miles. Towards the evening we encountered showers of hard, fine snow. On Monday we awoke to find the hills snow-covered, the roads frozen hard and sprinkled with fine snow, and a bitterly cold north wind sweeping over the country. This wind we had to face, and in passing through the valley to Birkhill we found it tearing along at a very high velocity between the hills, and carrying with it snow showers which cut the face and eyes most cruelly. The shepherds in their plaids were with difficulty making their way against the wind. The ascent of the last two miles of Birkhill we made at 9 miles and $7\frac{1}{2}$ miles per hour respectively, and we arrived in Edinburgh at 1.25, having had a cold but, for all that, an enjoyable drive of 60 miles before lunch.

The carriage on which Dr. Dawson Turner drove me is a Delahaye phaeton, having seats for four, a hood, pneumatic tires, and a horizontal two-cylinder motor of nominally 8 h.p., but giving actually about $10\frac{1}{2}$ h.p. The transmission is by means of belts. By many, belt-driving machines are derided. I have had no experience of the Delahaye on slushy roads, but Dr. Dawson Turner tells me that so admirably are the belts adapted to their work, and so thoroughly are they protected from road-splash and wheel-splash, that he has little or no trouble with them, even in very wet weather. During the 300 miles which I travelled on the Delahaye car it behaved most admirably. In going up even very steep hills there were no signs of belt slip. Its hill-climbing powers are extraordinary, and from observation made by me I am inclined to believe that were legal restrictions as to speed removed, the car could with four passengers on board make the journey of sixty-two miles from Kendal to Carlisle—(that is to say, the trial journey of the 1st May)—including the ascent of Dunmail Raise, in $3\frac{3}{4}$ hours, and the journey of 100 miles from Carlisle to Edinburgh, including the ascent of Birkhill, in 6 hours. The machine gave very little trouble, the main cause of anxiety being the presence of solid matter in the petroleum spirit. It is devoutly to be hoped that the time is not far distant when Messrs. Carless, Capel, and Leonard and the Anglo-American Oil Company will not permit a single receptacle of petroleum spirit to leave their premises without the cork being covered by a metal or other seal, so that automobilists may receive the spirit from the agents in receptacles sealed by the makers, and may thus be satisfied by

ANOTHER VIEW IN MESSRS. MARSHALL'S WORKS (see opposite page).

the unbroken seal that they obtained the spirit in the condition in which it left the maker's hands.

THE PIONEER OF AUTOMOBILISM.

WAR Offices are not always slow in their investigations, although our own military authorities have been rather prone to ignore the progress of automobilism. And in the early days of experiment it was the War Office of France that gave to one of the pioneers of the motor-car both encouragement and help.

Drawing vehicles without horses was the subject of a patent taken out in England by Ramsay and Wildgoose in 1619; but that can be left alone, as it evidently was neglected by their contemporaries and successors. To the French, who have made such advances in automobilism during the past few years, must be accorded the position of pioneers; and although others had vague ideas of the possibility of carriages being drawn by other power than that of the horse, the credit of having constructed the first steam carriage to carry passengers belongs to Nicholas Joseph Cugnot, an ingenious Frenchman, who had served in both the German and French armies. On retiring from the latter he took up residence at Paris, and having secured the patronage of the Minister of War was able to carry on a series of experiments until, in 1769, his steam carriage was sufficiently advanced to be tried on an ordinary road. Travelling with four passengers at the rate of two and a quarter miles per hour it came to a standstill after a run of about twenty minutes, owing to the boiler being too small. A further mishap occurred shortly afterwards, a stone wall being knocked down, which naturally served to excite unfavourable comments from those interested in the maintenance of the old system. But the French Minister of War recognised that the invention had merits, and he not only advised but also helped Cugnot to continue his studies. In 1770 the latter produced a machine—still preserved in Paris—which did most satisfactory work—if allowance is, of course, made for the early stages of the industry. The vehicle was actuated by an ingenious form of high-pressure engine, and consisted of two parts united by a movable pin. The body of the carriage was on two wheels and had a seat for the steersman, while the engine and boiler were supported by a single driving wheel of 4ft. 2in. diameter. On the framework of the fore part was a toothed quadrant actuated by spur gearing on the steersman's shaft near the seat, so that the carriage could be turned in either direction at an angle of from 15 deg. to 20 deg. A round copper boiler with a furnace inside was in front of all. Ratchet wheels were on each side of the driving wheel, and as a piston descended the piston rod drew with it a crank, the pawl of which, working into the ratchet wheel, caused the driving wheel to make a quarter of a revolution. This movement placed the piston on the other side ready for making a stroke and turned the four-way cock so that the second cylinder was opened to the steam and the first to the atmosphere. The descent of the second piston then caused the leading wheel to make another quarter of a revolution while restoring the first piston to its original position. Some successful trials were made, but the weight of the boiler in the front part, running practically upon one wheel, did not tend to steadiness and one day it overbalanced itself. Consternation seems to have seized the authorities, for they confiscated the carriage and imprisoned the inventor. Ultimately he was released and awarded a pension, but the troublous period in which he lived did not conduce to his prosperity, and after many vicissitudes he died at Paris in October, 1804. But his name will ever find record in the annals of automobilism.

It has been decided that the following gentlemen shall act as judges in connection with the laboratory tests of the horse-power of road wheels of motor-vehicles which are being organised by the Automobile Club, and which are to take place in the autumn:—Mr. Worby Beaumont, Professor Boverton Redwood, Mr. Dugald Clerk, Major H. C. L. Holden, Mr. Bryan Donkin, Professor Vernon Boys, Mr. Alex. P. Trotter, Professor Unwin, Professor Capper, Professor Hudson Beare, Professor Archibald Barr, and Mr. Carus-Wilson.

A MANCHESTER AUTOMOBILE FACTORY.

VISIT TO MESSRS. MARSHALL AND CO.'S WORKS.

PROMINENT among the English establishments devoted to the production of automobiles are the Belsize Works of Messrs. Marshall and Co., Clayton, Manchester. Clayton is one of the industrial centres of Cottonopolis, and these particular works promise to develop into an important factor in the workaday life of the locality. The area occupied is rectangular in outline, with an area of 6,000 square yards, half of which is covered with buildings. There is thus ample room for the extension that the development of the industry will doubtless require.

The accompanying photograph of Mr. J. J. Mann, to whose energy and acumen the development of these works is due, will be regarded with interest by those who read his speeches at the Automobile Club discussions, and recognise the merits of the Marshall car when running on the road. Mr. Mann has had

MR. J. J. MANN.

exceptional opportunities for observing the progress of the industry with which he is now closely identified, having resided for many years in Paris, where he followed the course of improvements both in construction and design. He is a director of the Société L'Energie, of Paris, who are the owners of the patents for the Renaux motor-tricycle. In other directions his energy has always found vent, and in electrical circles he is known as the inventor of the call-wire system, and of Mann's circuit line, which has been adopted in connection with most of the large town public services of the National Telephone Company.

The Belsize Works are admirably adapted for the production of automobiles, and while on a recent visit we had an opportunity of personally testifying to the excellent arrangements made both for the comfort of the workmen and for facilitating the making of cars. All the departments are on the ground floor, the space required by the different departments being kept quite distinct by wide passages, which have the further utility of allowing the cars to be easily transferred from one section to another. Along the side of the building fronting Clayton Lane

the counting house, drawing offices and stores have been located, and on entering the works we found all the heavy tools placed to the immediate left. These appliances are of the latest design, the planing machines being by the American Tool Works Company, the heavy lathes by the same company, and also by Messrs. Pratt and Whitney, while Messrs. G. Richards and Co., of Broadheath, Manchester, supplied the side planers, which are a noticeable feature of the splendid equipment.

Further removed from the entrance, but on the same side as the heavy machinery just particularised, is the milling department, to which equally efficient and modern appliances have been supplied by Muir and Pratt and Whitney, while nearly all the milling machinery is from Messrs. Brown and Sharpe's latest models.

On the side of the central passage a row of radial drills by Messrs. Richards and Co. is the characteristic feature, so arranged that the heavy work can be easily brought to them. Elsewhere in the works the remaining drilling machines, including multiple drills of the latest design, have been placed for convenience.

At the extreme left-hand corner of the building the well-stocked pattern shop and a useful experimental room have been placed, while at the end opposite to the offices are the smiths' hearths and testing stocks for motors. In front of these, and stretching from one side of the works to the other, are rows of benches for the fitters, and here, at all times, can be seen a large number of oil motors in all stages of construction.

The departments concerned with the lighter and finishing part of the works are arranged on the right hand. There are fixed all the small lathes for brass finishing, and experts in the finer parts of mechanism are there employed, five enamelling stoves completing the equipment.

To motorists generally the section of greatest interest is the central part of the works, views of which are given on page 58. Practically the whole of this area is taken up with the operations of building up the motor-cars from the parts prepared in other departments. And here about twenty cars can always be seen in course of building. Although a number of the bodies are obtained from other makers, Messrs. Marshall and Co. find it convenient to keep a number of body makers on the premises, and these are employed on the latest woodworking machinery.

An interesting department is that where are the pits for testing the complete cars. The car to be tested is placed over one of these pits with the back wheels resting on two sunken pulleys, the periphery of each pulley being on a level with the floor. On the engine being started the car instead of going forward simply revolves the pulleys by the friction between the back wheels and them. The revolving of pulleys is made difficult by means of a brake of calculated power, so that it is easy to see if the motor of each car is up to the standard power.

All the painting operations are performed in a separate building. The storage accommodation is of a threefold character, one store being in the central part of the building, where the different parts of motor-cars are tested as to their accuracy while in process of production. Having been finished, these parts are taken to a second store, while yet another is provided for the accommodation of all the raw material used in the works.

We were much struck with the way in which every detail has been arranged, for while the heating of the premises by steam and also by hot-water apparatus is all that can be desired, the works are lighted by electricity, for the generation of which two dynamos are requisitioned. Along the passages dividing the departments this is supplemented by large gas lamps on the incandescent principle.

MR. E. MARTIN, of 27, Park Lane, Clissold Park Road, can be recommended to any automobilist requiring the services of a competent man to drive and look after motor-cars in the forthcoming 1,000-mile Trial.

THE London Autocar Company, Limited, of Gray's Inn Road, W.C., inform us that they have arranged to carry a stock of all parts and accessories for the motors (70 and 72 mm.) of Beeston tricycles. This should be welcome news to owners of such machines.

THE "STÉATE" SPARKING PLUG.

IN the bulk of sparking plugs so far employed in connection with the ignition of the charge in combustion chambers of petrol motors, porcelain has hitherto mainly been used as the insulating material. In view of the trouble that has been experienced by *chauffeurs* with sparking plugs of this type, two Belgian engineers, Messrs. E. Fremy and M. F. de Mare, have for some time been devoting attention to the question of discovering a substitute for porcelain, which, while possessing all of its advantages, shall not be accompanied by any of the drawbacks such as mis-fires, slow sparking, short circuits, etc. This they claim to have done in the "Stéate" sparking plug, illustrated herewith, the feature of which is that no porcelain is used in its construction. Instead, they make use of the mineral, steatite, which they claim to form a peculiarly well-adapted insulating material for sparking plugs. In its natural state this mineral can, they inform us, be "worked" as easily as soap and can be turned much easier than a block of copper; crude, it can be scratched by the nail, but after being baked in a furnace at a high temperature, emery hardly makes any impression on it. Other advantages claimed for steatite are, that the baking operation does not deform the piece, or cause any variation in its dimensions, that both its mechanical and electrical resistance are increased by the baking, which properties are retained both when cold or when submitted to the high temperature in the combustion chamber of the motor. The "Stéate" plug is connected to the metallic parts without any joints whatever; it is supplied ready adjusted in a short metallic sheath, and is being put on the market by Les Sciences Industrielles, of 43, Boulevard du Hainaut, Brussels.

It is stated that the next run of the Automobile Club of America will be to Philadelphia, and will probably take place the first week in April.

A GENTLEMAN purchased a motor-quadracycle from the Riley Cycle Company, Limited, Coventry, last week, and rode it right through to Manchester under six hours. Considering that it was a brand new machine, this is not a bad performance.

M. E. J. BRIERRE, of Paris, informs us that he has placed the sole agency in England for the Brierre motor-voiturette, illustrated in our last issue, with the London Motor Van and Waggon Company, Limited, Tottenham Street, Tottenham Court Road, London.

THE *Court Journal* remarks that there are already a few very smart "cars" to be seen in the Park sometimes—one enamelled white being aggressively noticeable. It will, however, be possible to judge in another two months whether motor-car driving is to be as fashionable as the makers predict. Ranelagh is going to encourage automobile races and meets, and, no doubt, Hurlingham will do the same, while there will be at least one "motor four-in-hand" at the Derby.

As already mentioned in these columns, in connection with the 1,000-mile Trial a special dinner is to be held at the Agricultural Hall on Wednesday, April 18th. The dinner will be open to everyone taking part in the Trial—whether they be manufacturers, agents, private owners, passengers, or paid drivers; and it is hoped that every person taking part in the Trial may be present. The tickets for the dinner may now be obtained from the offices of the *Motor-Car Journal*, or from the Steward of the Automobile Club, price 2s. 6d. each (without wines).

THE DESIGN OF AUTOMOBILES.

(Concluded from page 41.)

IT MIGHT be objected that the carriage-building industry is not solely concerned with light, elegant, flexible carriages, but also produces heavy vehicles designed for heavy loads, and that the automobile builders might pattern after these, and thus acquire the art of motor-vehicles construction with one bound, saving an unprofitable apprenticeship. But this consolation is illusory, for heavy horse-drawn vehicles are not intended for high speeds as are those automobiles which would equal them in weight; and automobiles intended for heavy hauling at slow speed would be still very much heavier than the horse-drawn vehicle intended for the same work.

So long as the present lines of automobile construction are followed, each style of automobile must remain much heavier than the style of horse-drawn vehicle intended for the same purpose, and no profitable parallels may therefore be drawn from the construction of one to the construction of the other. This truth becomes still more conspicuous to the intuition when it is remembered that the distribution of material is entirely different in the two classes of vehicles, owing to the load of machinery in the automobile and the radically new strains that spring from applying the power at the rear wheel rim in automobiles, instead of at the front wheel hub in horse-drawn vehicles, and also other strains due to the different steering methods.

Some additional reasons should perhaps be pointed out why there is little hope for the deliberately-heavy "scientific" vehicle favoured by the orthodox engineer, as above referred to. This style is admittedly a possibility for good roads, and that is certainly something to boast of; but aside from this limited usefulness—which is being thoroughly exploited in France, in the Panhard-Levassor construction especially—it has few chances for success in the United States for any form of pleasure vehicle, because weight and bad roads are two factors that aggravate each other mutually, and when the requirement of speed is added as a third factor, the combination becomes outright impossible.

It being understood that in its safest form this style of vehicle consists of rigid portions flexibly connected by springs, substantially as above described, it is first noted that a shock from the road may have to be sustained by any one of these springs alone, and they must therefore be made so strong and stiff that they will afford very little protection for wheels, axles and motor mechanism (while occupants may be protected by special spring-supported seats) against the constant succession of smaller shocks associated with common-road travelling and the vibration set up by the same, and by this constant trembling, machinery and wagon-work are rapidly deteriorated and a new necessity created for still further increasing dimensions of material and weights in order to resist it.

It is true that in one of the heaviest American gasoline carriages, made in Holyoke, Mass., a system of auxiliary springs has been introduced, with the effect that small shocks are absorbed in the weakest springs, and the other stiffer springs begin to operate in each case only after the resiliency of the weaker springs has been exhausted; but this is at best only an exception from the general rule, and, as such, shows, moreover, that necessary details even in this heavy form of construction have not yet been worked out by the majority of its representatives in the industry.

Another fact operating against the heavy good-roads vehicle of the usual type is the impossibility of providing much lateral flexibility between the wagon box or carriage body, containing the motor, and the rear axle. The power transmission gear operating between the motor shaft and the axle does not permit much twisting—if it consist of sprocket and chain or gear wheels, as usual in American automobiles—and a sideways jolt which should ordinarily compress one of the rear axle springs and dislodge the other now transmits a strain to the transmission gear and the carriage box, involving manifest danger of disrupting some portion of the structure, unless new material be added to prevent it.

With belt-driving this drawback is of course avoided, and

with electric carriages it does not exist, because the power transmission is by wire to the motor on the rear axle; but it does exist in the majority of American gasoline and steam automobiles and interferes with the benefits to be derived from the rear springs, and these benefits are the more indispensable the less reliance may be placed in the evenness of the road surface.

Usually large pneumatic tires are the expedient chosen for mitigating the strains referred to, as well as all other strains arising from rough roads, it having been accepted as an axiom—transmitted from cycloedom, it seems—that pneumatic tires are well adapted for this purpose. And, in truth, it may be admitted that the heavy good-roads automobile, when used on poor roads, stands more in need of a resilient tire than any other moving thing; but it is unfortunately also a fact that no pneumatic tire has yet been invented the material of which will endure the strains of, for example, serving to stop suddenly, by ground friction, a heavy automobile on a down-grade curve. The use of rubber for the tires of very heavy vehicles is purely in the experimental stage, so far as economical usefulness to the owner of an automobile is concerned.

The most rational method so far devised for obviating twisting strains on motor and gear parts, and at the same time perhaps economising weights somewhat, consists in hanging the motor on the frame of the vehicle rigidly connected with the rear axle, thereby removing its weight from the carriage body and the springs supporting the same and also gaining carrying-space in the wagon box. There is nothing to hinder the employment of special springs for the support of the motor in this position, and the method would undoubtedly be adopted by all designers of heavy automobile vehicles, were it not for the intolerable inconveniences that accompany it and the general unsightliness of the construction. Among the inconveniences it may be mentioned that the design compels slight repairs and adjustments of motor parts to be made by the operator lying flat on his back, reaching upward, and likely to receive scalds from hot lubricating oil dropping on to his face. This spectacle is, however, often witnessed in Europe, where this design has been in considerable favour, probably chiefly with a view to the increased carrying capacity of the vehicle.—By M. C. Krarup in the *American Machinist*.

THE Motor-Car Company, of Shaftesbury Avenue, E.C., expect to have over a new type of Renault car in a few days. The vehicle will be fitted with a 3½ h.p. De Dion water-cooled motor, and will also be provided with a modified form of variable speed gear. The Duke of Manchester, who has already purchased a Stanley steam car, has, we learn, already ordered a car of this type.

WE have received through Messrs. Shippey Bros., Ltd., King Street, E.C., the English agents, a copy of the new catalogue lately issued by the Riker Electric Vehicle Co., of Elizabethport, N.J., U.S.A. The list, which is handsomely printed and illustrated, gives particulars of the various parts of the Riker vehicles, also full page illustrations of a number of types of Riker electric cars, including a "runabout," a phaeton, a victoria, a brougham, a theatre bus, a delivery van, and a heavy truck.

A CURIOUS accident occurred recently in the store-rooms of an automobile company in New York. A cleaner was inspecting vehicles on the cleaning and polishing floor. Orders had been given not to move the car by motor power on the floor. The steam had been generated in the boiler over a gasoline burner for the usual tests, and when it became necessary to move the vehicle, the young man started the motor. The seat had been removed in order to watch the test of the boiler, so that the cleaner stood upright. The carriage was run near the opening to the elevator shaft; it was then stopped and the man intended to back it into its place, but instead of moving the reverse lever he moved the throttle lever and the heavy vehicle plunged against the steel gate of the shaft. Unfortunately it gave way and both man and machine went over the edge. The man first reached the ground some sixty feet below, and the vehicle, banging from side to side of the shaft, fell on him and crushed his skull so that death was instantaneous.

THE BORON ELECTRICAL GENERATOR.

THE Boron primary cell, which was first introduced to the public in 1894 by Professor Henry Warren, Principal of the Liverpool Research Laboratory, and founder of the Boron Battery Company, has, since its introduction, very considerably evolutionised. In its primitive state the cell was for the most part a double-fluid battery, charged either by a soluble dichromate, preferably chromic acid, or one of its haloid compounds. The production of the carbons has undoubtedly been the success of the battery from the very start; since the author, having studied for years both the actinic and catalytic action of the numerous metalloids and their derivatives, has at last been able to produce a cell which is claimed to practically defy polarisation.

The generator on this account alone is naturally particularly well adapted for the charging of accumulators. Depolarisers in this instance should be either ferric sulphate, chromic acid, or potassium bichromate, and the cells, used either in series or parallel, as the case may require, are connected by the positive of the accumulator to the carbon of the cell, and the negative of the accumulator to the zinc element of the battery. Usually about five hours is the time required for charging, and the cost of the same (as for instance the charging of two sets of accumulators for motor-car ignition purposes) usually does not exceed twopence. It is claimed that the cells are so constructed as to last a lifetime without any creeping of the salts or deterioration of the carbons, and the solution can remain in the jars without experiencing any change when the cell is out of action. The zincs, which are also very small, can remain in when not in use, or be lifted from the solution, and are thus always ready when required. The cell will run with one charge of three ounces of chromic acid or potassium bichromate for about forty hours constant, the practical output being an E.M.F. of two volts, the amperes ranging from eight to twelve, or as high as thirty, according to the depolarisers employed. The cells are made slightly different when required for such purposes as motor driving, lighting, or plating, but in any case, we are informed, are equally as constant.

AN automobile club is to be organised in Minneapolis, Minn.

WE understand that many of the gentlemen who went to the United States early in the year, in connection with the Anglo-American Rapid Vehicle Company, have returned to this country.

THE Noye Manufacturing Company, of Buffalo, N.Y., have lately introduced a new horizontal petrol motor for motor-car propulsion, which they have named the "Niagara." It is described as a valveless engine, operated, as desired, either on the two-cycle or four-cycle principle. To obtain this result no extra parts are added. A loose collar on the gear shaft, placed at one end of the shaft, makes the engine run two-cycle; when this collar is placed at the other end of the shaft the motor runs four-cycle. The change can be made permanent or while the engine is running. The motor, being valveless, the makers claim a reliable compression, without variation, at all stages. The gas and air entering the enclosed base are thoroughly mixed by the rotation of the crank before entering the cylinder. Lubrication of all the working parts takes place from the supply of oil fed to the inclosed crank case. The double cylinders, running two-cycle, give two impulses to a revolution, and very nearly constant power. The carburettor used with the motor is very simple, consisting of but one or two pieces. The petrol is supplied to the carburettor direct from the main tank, the quantity being controlled by the motor without the use of needle valves or pumps. The gas for the motor is generated as used, but the mixture is not varied with the varying speed of the motor. The speed of the engine is controlled by a throttle connected with a varying spark. The ignition is caused by a spark in the firing chamber at a point where the purest gas enters. The contact produces what is called a drawn spark, and with only a 10in. spark coil will, it is claimed, produce a spark fully $\frac{1}{2}$ in. long.

A MOTOR-CAR ACCIDENT.

AT the Brighton County Court last week Mr. William Mundy, 52, Whichelo-place, Brighton, fly proprietor, sued Mr. C. Friwell for £5 5s. for damages to plaintiff's victoria through the alleged negligent driving of a motor-car by the defendant on the King's Road in November last. Mr. Buckwell appeared for the plaintiff, who said he was driving his cab along the King's Road on "Motor-car day" when defendant tried to turn his motor-car round in front of the Metropole and ran into the cab, breaking the step and the wings, straining the front carriage and the hind spring.—Thomas Harrington, carriage builder, Church Street, proved repairing the damage to plaintiff's cab for five guineas, and his Honour gave judgment for plaintiff for the amount claimed with costs, payment forthwith.

FURIOUS DRIVING CASES.

AT Wolverhampton last week, Mr. Joseph Lisle, Tettenhall, was summoned for driving a motor-car along the Penn Road at a greater speed than was reasonable and proper, to the common danger of passengers.—Two constables swore that defendant was travelling at the rate of twelve miles an hour.—The Stipendiary, while holding that the speed was unreasonable assuming that the evidence of the police-officers was correct, dismissed the summons on the ground that there was no proof of pedestrian or vehicular traffic on the highway at the time.

BEFORE the Brighton Borough Bench on Monday, Mr. E. A. Salamon, of 14, Great Cumberland Place, London, was summoned for driving a light locomotive on King's Road at a speed greater than was reasonable and proper, having regard to the traffic on such highway, and the safety of pedestrians, on the 18th inst. Defendant did not appear. Hackney Carriage Inspector Ranger stated that on Sunday afternoon, the 18th inst., about 3.55, he saw the defendant driving a motor-car by West Street, going westward. He was going about sixteen miles per hour. Defendant pulled up at the Metropole Hotel, where witness obtained defendant's name and address. Defendant said he did not think he was going more than ten miles an hour.—The Deputy Stipendiary said defendant had written a letter from which it appeared he was evidently a "beginner." He would be fined £5 and costs, or 21 days' imprisonment.

THE UNIVERSAL MOTOR CARRIAGE AND CYCLE COMPANY.

AN extraordinary general meeting of the shareholders of the Universal Motor Carriage and Cycle Company, Ltd., was held at the Institute of Chartered Accountants, Moorgate Place, E.C., last week for the purpose of considering the following resolution, namely:—"That it is desirable to wind up the company, and accordingly that the company be wound up voluntarily, and that Mr. G. H. Chantry, of Blakemore and Chantry, chartered accountants, of 57, Moorgate Street, E.C., be appointed liquidator for the purpose of such winding up, at such remuneration as may be fixed by the members of the company." After some discussion the resolution was adopted.

THE Motor-Carriage Depôts, Limited, 6, North Charlotte Street, Edinburgh, is to be wound up voluntarily.

AN automobile club is to be organised in San Francisco on the lines of the Automobile Club of America.

LA SOCIÉTÉ L'ÉLECTRIQUE, Compagnie Française d'Exploitation de Voitures Automobiles, of Paris (8 Rue Drouot), is increasing its capital from £12,000 to £60,000.

MR. ARTHUR J. EDDY, a prominent attorney of Chicago, was the first automobilist of the city to obtain a licence as a driver of automobiles, after passing the necessary examination.

THE Automobile Forecarriage Company has just been formed in New York with a capital of £1,000,000 to manufacture and deal in carriages, automobiles, etc. This is the company which is introducing the Kuhlstein-Vollmer *avant-train* into America.

AMONG the new joint stock companies registered last week was the Speedwell Motor-Car and Cycle Company, Limited, 71, Woolmanhill, Aberdeen, the capital being £2,500. The company has been formed to carry on the business of motor-car and motor-cycle builders or agents, cycle manufacturers and agents, etc.

A DISPATCH from Boston states that Senator Baldwin has introduced in the Massachusetts Senate a bill for legislation to control the operation of automobiles. The bill provides for such fenders and wheel guards as may be required by the railroad commissioners, who are to notify companies and persons manufacturing and using these vehicles within three months after the passage of the Act.

THE Motor-Car Journal.

VOL. II.]

LONDON, FRIDAY, APRIL 6, 1900.

[No. 57.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON Saturday, the 14th inst., the portals of the Agricultural Hall, Islington, will open on the Automobile Club's great exhibition of motor-cars, which the proprietors of this journal are directing. As already intimated, the arena which proved so popular for demonstrating purposes last year will again be available, and exhibitors will doubtless be glad of the opportunity thus presented of showing intending purchasers the control which is possible over their vehicles. On the various stands will be exhibited some interesting novelties, and many improvements in the details of construction that have lately been introduced will be on view. It is gratifying to all concerned in the development of the industry to know that a thoroughly representative display has been got together, and it can safely be anticipated that the forthcoming exhibition will be the largest, most comprehensive, and the best ever held outside of France. The entire space on the ground floor has been allotted, and practically every British firm in the industry and several of the leading Continental builders will be represented.

Provincial Visitors.

Of course, all who are interested in the industry will attend the exhibition during the week it is open; but the attendance of the general public is also likely to be greater than in the past. The railway companies are running holiday excursions from all parts of the country, and many provincial people will take advantage of Easter to attend the exhibition. Business men in the great provincial towns cannot afford to give up much time on ordinary occasions, but many of them will gladly regard this as a convenient season for coming to London to see the latest things in the way of motor-cars.

A Popular Feature.

LAST week we referred to the remarkable performance given by Mr. E. J. Coles at the Alhambra, and we are now glad to announce that arrangements have been made for him to repeat his feats at the Agricultural Hall every afternoon and evening during the progress of the Exhibition. The slope and other appurtenances of his display will be re-erected in the arena, and the repetition of his performances, which have elicited much attention in the Press, should prove a popular feature calculated to increase the attendance of the general public, and to impress all who go to the exhibition with the absolute control the drivers can obtain over their cars.

The 1,000-Mile Trial.

MOTORISTS who intend to participate in the forthcoming great Trial are taking preliminary spins over portions of the course and generally getting into trim for the task. As the time draws near we are constantly receiving further evidence of the popular interest in the event, and the fact that all the

leading newspapers on the line of route are making special arrangements for reporting the Trial is one upon which automobilists are to be congratulated. It is to be hoped that the local exhibitions will be well attended, and the letters received from the secretaries responsible for the arrangements in the various towns show that this is likely to be the case. Elsewhere we record a few facts which have come to our knowledge since our last issue, and we hope, next week, to bring this chronicle fully up to date.

Some Additional Entries.

SEVERAL additional entries have during the past week been received. In Section I., Messrs. Roots and Venables have entered a two-seated heavy oil-car. New competitors in Section II. are Mr. E. M. Iliffe, with a new 2½ h.p. Enfield quadricycle; Mr. Mark Mayhew, a 8 h.p. four-seated Peugeot car; and Mr. J. D. Siddeley, a two-seated Daimler Parisian car. The 12 h.p. Daimler carriage originally entered by Mr. Mayhew will be replaced by a Panhard car of 8 h.p., the reason being that the Daimler vehicle will not be ready in time for the Trial. The 2½ h.p. tricycle originally entered by the Ariel Motor Company will also, by permission of the club committee, be replaced by the same company's 3½ h.p. quadricycle.

A Boston Inquiry.

SOME time ago a few of the leading commercial men of the city of Boston, U.S.A., joined in an effort to secure reliable information with regard to the automobile, and Mr. W. A. Whittlesey was instructed to secure the necessary particulars, and to make a report which would guide them in the adoption or otherwise of the motor-vehicle. After much inquiry he has come to the view that the automobile will loom large on the roads of the future, and the pamphlet in which much of his information has been collated is of unusual interest, especially to those who have followed the progress of the industry in the United States. From the economic standpoint Mr. Whittlesey makes an interesting comparison of the cost of horse and electric services. In the case of the former the horse is supposed to average 21 miles per day, doing this at the rate of 7 miles per hour under a draw-bar pull of 50 lbs. "In other words, he is doing work at the rate of .89 of a theoretical horse-power for three hours per day. The automobile, on the other hand, is to do 42 miles a day at the rate of 9 miles per hour, and the cost of power is assumed to be five cents per k.w. hour. Under these conditions the automobile can do the work of two horses in 1.34 hours less time than they can do it with a saving of .01689 cents per pound of goods delivered, or at a saving of 40.752 cents per day on a delivery of 2,400 lbs."

Eastbourne and Motor-Cars.

EASTBOURNE is a very superior place; or, rather, the local authorities are very superior people. So eminently respectable are they that they would fain prohibit motor-cars from their Parade and from Paradise Drive. In fact, many of the learned councillors would like to see Eastbourne traffic

monopolised by weary jades and the usual type of horses met with at respectable seaside towns. It appears that Messrs. W. Jury and Sons, Sidney Easton, and H. E. Stredwick have recently applied to the Watch Committee of the town for the renewal of their motor-car licences. This was agreed to by the committee, subject to the prohibition from the thoroughfares already mentioned, but at the meeting of the full council even that curtailed form of licence met with opposition, and a proposition was made by Councillors Welch and Turner that the whole recommendation be struck out. Ultimately that was not pressed, councillors evidently being careful not to go the whole length of their intention, and so preferring to give something with one hand and take it back with the other.

Playing the Ostrich.

FOR that is practically what was done in the end, when temporary licences were granted till the next council meeting, the matter being referred back to the Watch Committee in the meanwhile. Evidently there is a section of the council that does not want the parade—one of the best sea-side fronts in England—to be utilised by visitors who favour the automobile. This is a short-sighted policy that should be resented by everyone anxious for the prosperity of the town. During last season some 3,000 or 4,000 visitors were carried by motor-car during each week, so that the popularity of the vehicles was fully established. At all the Continental seaside resorts these cars are not only allowed but encouraged, the authorities recognising that they constitute an attraction that pleases visitors and helps towards successful seasons. Now that Bournemouth, Hastings, Clacton, and all the progressive seaside places are obtaining motor-car services to a much greater extent than is proposed at Eastbourne, it does seem folly for the local council to respond to the crack of the cab-drivers' whips and play the ostrich, digging its head in the sand—blind to progress and, we would add, the prosperity of the town.

Automobiles Help Seaside Prosperity.

WHY Councillor Eden should want to exclude motor-cars from Paradise Drive no son of Adam can be expected to understand—unless he feels that there is a likelihood of a greater popularity of the motor-car and its power of serving the public better than ordinary vehicles driving cars and char-à-bancs off the road. But the same argument was used at the introduction of railways, and is as antiquated as the ancient civilisation of the Egyptians. It ought not to be allowed to prevail so close to the Twentieth Century, and we hope the councillors of Eastbourne will learn wisdom, and recognise the advantage that must accrue to the town from a broad and tolerant treatment of those who seek to give its streets the best and most modern means of locomotion. Certainly hotel-keepers and those who cater for the accommodation of visitors, as well as residents who wish to see Eastbourne even more prosperous, should welcome the encouragement of the automobile.

Motors and Mushrooms.

STRANGE indeed have been many of the paragraphs appearing in the general newspaper press with regard to the influence that will be exercised by the extended adoption of the automobile. Not long ago an American doctor pointed out that horses were largely responsible for our plagues of flies, and contended that the motor-vehicle would give them nothing to feed upon. Now comes the news that the automobile has greatly increased the price of mushrooms in Paris! To grow the finest variety of champignons refuse from the stalls of mares is required. The great stables of Paris, in the days of omnibuses, met this demand, as there were separate stables for the mares. The automobiles have done away with large numbers of horses, the great stables have been abandoned, and mixed stables substituted, greatly decreasing the supply of the essential fertilizer. Who, other than a French journalist, would have thought of this

intimate connection between motors and mushrooms? American newspaper men should now endeavour to carry their imagination a little further.

Local Authorities.

WHEN local authorities realise the effect that automobiles will have in connection with street traffic—both as regards the crowding of roadways and their maintenance in cleanliness—we may hope for a more sympathetic attitude towards the development of mechanical traction on ordinary roadways. Hence every motorist should endeavour to secure the interest of members of local boards in the subject. We would suggest that personal invitations given to such gentlemen to visit the exhibition to be held this month would prove most helpful in this direction.

Exhibition at Vienna.

WE have been asked by Mr. F. Stockinger, who is the Consul-General in London for Austria-Hungary, to give the publicity of our columns to an exhibition which is to be held at Vienna between May 31st and June 10th. Prince Max Egon Furstenberg and Herr Paul Von Schoeller, the British Consul-General in Vienna, have consented to be presidents of the exhibition, which will be held under the auspices of the Austrian Automobile Club. Foreign productions intended for the exhibition will be admitted free of duty and returned free of charge after the event. The exhibition will include motor-cars, parts and accessories of the same, and all appurtenances to the sport. Prizes are to be awarded in various classes.

Motor Dust-Carts.

UNDOUBTEDLY those firms who specialise motor-vehicles for municipal purposes will find plenty of employment ere long. In addition to the orders recently given out another may shortly be expected from Acton, for we learn that the Works Committee for the Acton District Council have directed the surveyor to make inquiries as to the advantages, cost, and utility of motor dust-carts. Already a vast amount of experience on this subject is being accumulated, and there should be little difficulty in convincing the local authorities of Acton of the value of mechanical power in collecting street and house refuse.

"Motor-Vehicles and Motors."

WE learn that practically the whole of the comprehensive book some time ago announced as from the pens of Mr. W. Worby Beaumont and of Mr. Dugald Clerk is now in the hands of the publishers, Messrs. Constable and Co. The book will deal but briefly with the history of the work of the early steam coachmen between 1824 and 1836, but practical deductions from their designs and experience will be presented. The intermediate period between 1840 and 1885 is more fully dealt with. The great bulk of the book, which will comprise about 600 pages and over 400 engravings, relates to the design, construction, and working of oil, steam, and electric vehicles, most of them dating from 1894 to 1900. At least 300 of these engravings have been made from special drawings to scale. The scales are given in British and metric measures, and the drawings have been made to show every piece of mechanism and every connection. The book contains chapters with elaborate but practical tables of power required; wind and road resistances, frictional losses and mechanical efficiency, on vapourisers and carburettors, on the apparatus and methods of electrical ignition, on brakes, steering gear, and on analyses of the performance of vehicles in the organised trials and races which have taken place in England and France. The part of the work as originally intended by Mr. Dugald Clerk, on, amongst other matters, the physics and economics of internal combustion in motors, and the index to patents, having been unavoidably delayed, will appear hereafter as a second volume.

An American Lady Motorist.

EXAMINATION papers—whether at Oxford or at a Board School in South London—have always produced some amount of fun for others than the actual writers, and automobile tests in the United States will probably soon supply the American newspapers with columns of light reading. Up to the 14th ult. about sixty operators had been licensed in the city of Chicago, the last batch of candidates including Miss Julie E. Bracken, who was the first lady to enter the lists. She is secretary to Mr. C. G. Woods, of the Woods Motor-Vehicle Company, and after she had answered the technical questions, took the City Electrician, Mr. Ellicott, for a ride, and rather astonished him as she showed how expertly she could “cut figure eights, circle around in front of trams, shave the wheels of two-ton trucks, and dust the coat-tails of pedestrians at the crossings.”

Mr. Mark Mayhew, L.C.C.

THE photograph we are able to reproduce this week of Mr. Mark Mayhew, L.C.C., and his stud of motor-vehicles will be regarded with interest, not only by members of the Automobile Club, but also by those who remember his election of last year, when he went to the top of the poll—on a motor-car. The photograph “Scio,” Putney Heath, S.W., and Mr. Mayhew is seen holding the steering wheel of his Panhard racing car. The central vehicle is a 8 h.p. Peugeot car, and to the right is a 3½ h.p. Delagère tricycle. Both the carriages are entered for the 1,000-mile trial, and will doubtless perform the task with distinction.

MR. MARK MAYHEW AND HIS AUTOMOBILE STUD.

Mules rather than Motors.

MULES have always been regarded as strange, wayward, and obstinate creatures, and their frequent stampedes during the war now proceeding in South Africa should destroy what little character they formerly possessed. At Nicholson's Nek the eccentricity of the mules cost Sir George White hundreds of men, and we have just had another loss owing to other mules stampeding, overturning the waggons, and otherwise disporting themselves. Surely the War Office cannot longer turn a deaf ear to the request for experiments with motor-vehicles, seeing that the advocates of the automobile are prepared to give every help in the selection of vehicles which are to be trusted and regarded as efficient. Unfortunately, however, it is easier to drive a coach and four through an Act of Parliament than to get a motor-vehicle into the barrack yard—as a recognised feature of the military equipment.

Horse v. Automobile.

Two important points in connection with motor-vehicles are often overlooked by those who decry the new means of locomotion. Firstly, the little room in which an automobile can be housed as compared with a carriage and horse, and, secondly, the fact that all repairs required by the former are mechanical, and can be dealt with according to certain

rules and methods. On the other hand, the ailments of the horse are often beyond the range of human divination, and their treatment is frequently a matter of great uncertainty—if not largely of guesswork. It must not be forgotten, too, that the keep of the horse has to be continued whether working or not, while no attention need be given the motor-car under the latter circumstance. Of course, these points will be apparent to every automobilist; their frequent reiteration, however, must be regarded as a means of public instruction.

A Carriage Builder's Queries.

IN its recent suggestion to carriage builders, that they should watch the progress of the motor-car and concern themselves with its development, the *Carriage Builders' Journal* has struck a rich vein of correspondence, and its April number contains letters on the subject from Mr. G. H. Smith and Mr. J. E. Tuke from the standpoint of the automobilist. The views of the carriage builder are admirably given by Mr. William Philipson, of the Northumberland Carriage Manufactory Pilgrim Street, Newcastle-on-Tyne, in a letter which we reproduce, as it contains some points of interest for makers of automobiles. Some of the matters mentioned are certainly worthy of serious discussion, and we shall be glad to have the views of automobilists or manufacturers of motor-vehicles. We notice by the way that

our contemporary makes the interesting confession that it spells motor-car as “motocar” “simply and solely for euphony's sake” to avoid the ‘burring’ sound of the final’s.” It is thus apparently a concession to those whose articulation is not of the clearest order.

WE learn that Mr. Thomas Bayley, M.P., has just joined the board of directors of the Daimler Motor Company, Limited.

IN answer to “S. T.,” the address of the makers of the Scott steam tractor is the Société des Chaudières et Voitures Scott, 56, Rue de Provence, Paris.

MR. ROGER WAELACE, Q.C., Mr. Frank Butler, Sir David Salomons, and Mr. Staplee Firth, have been asked to act as the reception committee in connection with the forthcoming exhibition at the Agricultural Hall.

SAYS the *Court Journal*: “Automobiles are much in vogue this season on the Riviera. They are seen on every fashionable promenade, and at the door of every fashionable shop, popular café, and concert-room.”

OUR German contemporary, *Die Automobile*, states that the Berlin Electricitäts Gesellschaft is in negotiation with an English motor company with reference to the supply of motor-waggons for the transport of coal.

MR. H. EDMUNDS, of the firm of Messrs. W. T. Glover and Co., Ltd., Manchester, the well-known manufacturers of electrical cables, has lately placed an order for a Parisian Daimler car. The vehicle is being fitted with Mossberg roller bearings and with an Estcourt cooler of the type recently illustrated in these columns, and which obviates the necessity of using a water-circulating pump. Mr. Edmunds, who has just been elected a member of the Committee of the Automobile Club, hopes to drive his new car in the forthcoming 1,000-mile Trial.

CROWDED STREETS OF GREAT CITIES.

BY OBSERVER.

THE streets of London with their ceaseless flow of traffic from early morning till long past midnight are regarded by provincial and foreign visitors as among the wonders of the world. There is scarcely room to pass from pavement to pavement in many places, so constant is the stream of vehicles of every description; ever and anon stoppages occur for two or three minutes at a time, and immediately a block for two or three hundred yards is created. At a signal from the authoritative policeman the flow recommences, and traffic is resumed. Save at those points where police regulations are made, it is probably impossible to cross a City thoroughfare in a straight line, and the man or woman who cannot stoop below a horse's head or dodge a wagon had better strive to catch the policeman's eye, or, if the pedestrian be near the Mansion House, betake himself or herself into the subterranean pathways which have been formed for the safe passage of harmless people from one side to the other of the most congested spot in the City of London. This tendency to crowd our streets is increasing, and although the development of electric railways around the metropolis with the added mileage of underground locomotion must relieve the pathways to some extent, the vehicular traffic of City thoroughfares seems quite as heavy as ever.

None who have studied the conditions of traffic in our streets can have failed to have noticed how road space is wasted by drivers not conforming to the rule of the road, and keeping properly near the kerb. "It is probable," said Mr. R. E. Crompton in a paper written last December, "that the traffic on a sixty-foot road might be conducted in such a manner as to give two continuous lines each way and afford a third line for overtaking, and thus give double the capacity of a forty-foot road; that is to say that on a sixty-foot road 28,000 passengers could be carried per hour past any given point in one direction." If 28,000 people could be conveyed past any given point in an hour, something substantial would have been done to relieve the congestion of the streets.

It is very clear that the more rapidly the traffic can be conveyed the less crowded will our streets appear. Look at a thoroughfare where half a score of hansoms are being drawn by weary animals while the drivers are scanning the pavements for fares. If they were driven quickly—which could be done without adding to the risks of the streets—there would be many more opportunities for crossing the roads. The rapidity with which the traffic in London is passed along depends, in very great measure, on the speed of the slower vehicles. Other drivers may overtake such vans and conveyances (space being wasted in such room being allowed), but, in the main, they are the great factors in the locomotion of the streets, and if crawling cabs and pirate buses could be taken from our crowded streets and replaced by those which plied at a reasonable speed some ease of the present strain would take place. Under the present conditions the streets must become more and more crowded as the traffic grows and the quality of metropolitan horses declines—so far as their speed is concerned.

Something will have to be done. Increased railway facilities will prove but a small thing in lowering the great tides of traffic developing in volume; and tramways in the suburbs will not ease the central districts. They will, most probably, extend the area of congestion, since they require one-third of the roadway, which is practically taken out of general use in order that their passage may not be obstructed. To widen our streets or bring about any rearrangement so that the whole of their area might be utilised for traffic without waste is now practically prohibited by the cost of such needed improvements in the busy commercial districts. In some of the outer areas, however, the surveyors would do well to bear such matters in mind whenever opportunity for reformation occurs. Under the circumstances, therefore, we are limited to improvement in two directions, viz.: reduction in the area occupied by vans and horses and quickening of the speed so that a proportionately greater traffic can be transported in a proportionately less time.

In this connection the automobile furnishes the much-needed dual reform. The economy in space occupied by the electric-cabs and motor omnibuses which have been run in London was obvious to everybody, and the general adoption of such vehicles would give our main thoroughfares a very different appearance to that now presented. More than that, the rate at which traffic proceeds could be materially accelerated if horseless vehicles were generally adopted, and with that increase of speed there need be no greater risk for pedestrians, for the reliability of modern motor-cars is a matter of increasing acknowledgment. In fact, they can be stopped more quickly than most horses and vans, and many of the accidents now reported from horse-drawn vehicles would be avoided if motor-vehicles were more generally employed.

This is a matter which ought to be brought to the notice of local authorities throughout the country. Many of them are anxious to deal with the important question of street traffic, and hence their encouragement of the automobile ought to be easily obtained. Unfortunately the value it may be to them in solving pressing problems has not yet been directly presented, but as motor-vehicles become more common on the streets, their value will be more and more appreciated. Perhaps no more convincing argument could be given than the view which will be obtained in the arena at the Agricultural Hall during the week after next. Not only will it be possible to safely negotiate in that area twice the number of horse-drawn vehicles that would be allowable, but the cleanliness of automobiles will there be fully emphasised, for under the present traffic conditions an expense is incurred in keeping the streets cleanly and healthy that would be wholly unnecessary were automobiles generally adopted. Thus as a relief to crowded streets, and on economical grounds as well, we would urge local authorities to give heed to the new movement and to encourage the new industry.

THE "M.C.C. TRIUMPH" PETROL CAR.

THE illustration on page 67 shows a new three-seated car, which is being placed on the market by the Motor-Car Company, Limited, of Shaftesbury Avenue, London, W.C. As will be seen, it is of the Renault model, but is stated to comprise many improvements. The engine is a 3½-h.p. water-cooled De Dion, located under a bonnet in the front part of a tubular frame. Three speeds forward and a reverse motion are available, the variable-speed gear being of the Panhard type. No chains are, however, employed, the longitudinal jointed shaft being connected by bevel gearing direct to the rear axle. The wheels are of the cycle type, fitted with Dunlop Multiflex tires. The "body" is comfortably upholstered and is well sprung, the car, one of which has been entered for the forthcoming 1,000-mile Trial, having altogether an attractive appearance.

ON the afternoon of Thursday, the 19th, a meeting of the Motor Trades Association will be held at the Agricultural Hall.

LA SOCIÉTÉ FRANÇAISE DE VEHICULES ELECTRIQUES is the name of a company which has just been formed at 28, Avenue de l'Opera, Paris, with a capital of £12,000, to exploit the Riker vehicles in France.

WITH reference to the statement in a contemporary last week that Mr. C. Jarrott had accepted a position with the Anglo-American Rapid Vehicle Company, we are informed that this is incorrect. Furthermore, we learn that Mr. Jarrott has resigned the secretaryship of the British Motor Company, Limited.

MESSRS. DE DION, BOUTON AND Co., of Puteaux, France, have just delivered to the Italian Government some steam carriages of 50 h.p., each carrying a load of 4 tons and towing an 8-ton carriage. The trials of the vehicles lasted for three days, on very muddy roads, without the slightest accident, and included the great declivity of "Le Cœur Volant," between Marly-le-Roi and Versailles.

THE NICE WEEK.

(From Our Own Correspondent.)

WITH the irony of fate the weather experienced at Nice on the 28th ultimo, the day reserved for the display of the various competing automobiles, was as gloriously fine as that of the previous day had been wretchedly miserable, and in struggling through the crowded exhibition one heard on all sides the remark: "Oh! if we had but had this weather yesterday." Yes, had the atmospheric conditions of the two days been transposed a satisfactory termination of the Nice-Marseilles-Nice race would have been witnessed, and all the unpleasantness and irritation arising from the judges' extraordinary decisions with regard to the awarding of the prizes would have been avoided. The clerk of the weather must be held largely responsible for the lack of success of this year's Nice week; indeed, the worthy man seems to have laid himself out expressly to spoil the meeting. The exhibition of cars was held in the garage of the Nice Automobile, a well lighted and commodious building formerly used for panoramic displays, and the general arrangements being excellent the show passed off without a hitch. During the day the official awards of the prizes were made known, and except in the case of the big car category the decisions gave rise to the liveliest dissatisfaction.

As reported in these columns last week, Béconnais, Gasté, and Gaétan de Méaulne were the only three motor-cyclists to set out from Aubagne on the homeward journey at the appointed time, and of these the last-named was the sole representative at the finish, and he arrived after the *controle* had been closed. Ducom, another competitor in this category, started from Aubagne some three and a-half hours later than the above-named trio, taking the precaution to secure a certificate of departure signed by four witnesses, and he eventually reached Nice during the morning of the following day, that is to say, on the 28th ult. His certificate, however, availed him little, as he was refused classification upon arrival, and a similar fate befell the voiturette drivers, Théry and Jules Dubois, who, mounted on Decauville cars, also made their appearance during the morning, having been *en route* since 10.19 a.m. of the previous day. The time of departure of these two latter *coureurs* was officially noted at the Aubagne *controle*, and as apparently no limit of time was mentioned in the regulations governing the *course* the judges would seem to have adopted a somewhat high-handed proceeding in declining to classify the men, and to withhold the prizes. Théry and Dubois received recognition of their participation in the race at the start, and in the absence of a time limit it would appear only just that they should be timed at the finish. The feeling on this point is so strong that it is highly probable that M. Ravenez, the chairman of the Decauville Company, on whose behalf the two *chauffeurs* were competing, will institute legal proceedings

against the organisers of the meeting for the purpose of obtaining the advertised awards. The official awards as issued on the Wednesday were as follows:—*Motor-cycles*: Gaétan de Méaulne. Prize 500fr. and 1,000fr. *du temps primé*, that is a total amount of 1,500fr., or £60. *Voiturettes*: No prizes awarded. *Cars*: 1, René de Knyff, 1,799fr. 61c. and a medal; 2, Gilles Hourgières, 472fr. 32c.; 3, Charron, 461fr. 74c.; 4, Pinson, 293fr. 58c.; 5, Levegh, 237fr. 73c.; 6, Boson de Périgord, 210fr. 73c.; 7, Girardot, 201fr. 91c.; 8, Gui des Aunaies, 171fr. 90c.; 9, Kœchlin, 163fr. 42c. The system upon which the awards were made is known as the *temps primé*, and has for its object the recognition of every performance achieved in a race. In the past there would be, perhaps, three prizes given for some particular *course*, and the fourth man, although finishing possibly but very few seconds after the last of the prize winners, would receive no award whatever. This was not as it should be; for over these long distances the performances made by the third and fourth cars as above cited would be of practically equal merit, and accordingly race promoters endeavoured to hit

upon some plan whereby each competitor would be able to receive some recognition for a meritorious performance. The result of the deliberations is now seen in the *temps primé* scheme, and as judged by the initial experiment the plan is likely to work well. By this arrangement every competitor arriving within a certain time limit is entitled to a certain share of the prize fund, the exact amount being determined by the lapse of time between his arrival and that of the actual winner of the race. Taking for example the case of the first man home, the value of his prize depends upon how long after him the second man arrives, and so on

THE "M.C.C. TRIUMPH" CAR (for description see opposite page).

with the other competitors. In the motor-cycle section of this Nice-Marseilles-Nice event Méaulne was awarded on the judges' first decision not only the first prize, but the whole of the *temps primé* money, no other competitor being classified. But to return to the day's doings at Nice. After the close of the exhibition the majority of automobile men betook themselves to the Cercle Masséna, where, under the presidency of the Mayor of Nice, the Italian *chauffeurs* were entertained to a banquet. On the morning of Thursday, the 29th ultimo, the rain once again made its unwelcome appearance, and assuredly in no half measures, for it simply poured. The *course du mille* had accordingly to be postponed until the following Saturday, and the organisers of the week spent their time in reconsidering the situation arising from their decisions relating to the motor-cycles and voiturettes. It will doubtless be remembered that by the governing regulations only those vehicles which accomplished the distance of the race for which they had been entered would be eligible to compete in the two succeeding events, that is to say, the hill-climbing contest and the mile race. By the judges' decision the Nice-Marseilles-Nice race had terminated at Marseilles for the big cars, but for the other two categories the finishing point was still Nice, and as but one motor cyclist

and no voituresses had officially completed the course no competition in these two races was possible. The promoters were therefore compelled to make two extra categories for these stray sheep, and they further amended their original decision by classing Ducom second after Méaulne in the motor-cycle section. One small automobile incident served to brighten the day, and that was a speed trial made by Baron Henri de Rothschild with his twenty-four horse-power Cannstatt-Daimler over the 17 kilomètres of gradient used for the hill-climbing contests, and known as La Turbie. The Baron wagered twenty-five louis that he would ascend the hill in 20min., but his attempt was not successful, as his actual time was 24 min. 23 secs. Magnificent carriages as they undoubtedly are, these German racers are too heavy to rival the leading French makes in the matter of speed over a hilly course. The French cars are light, but that they possess at the same time ample strength is clearly demonstrated by the fact of many of them competing in race after race, in addition to daily touring runs, without coming to grief, or even showing signs of the terrible strains to which they have been subjected. As an example, there is M. René de Knyff's car, which he has used continuously since the Spa Spring meeting of last year. Fitted with a motor developing as nearly as possible 24 horse-power, this vehicle complete with body weighs 960 kilos, or about 17½ cwt., considerably lighter than an English 6 horse-power Daimler! But to continue the history of proceedings at Nice. Apart from automobiles the stirring incident of the day was the ascent of M. Santos Dumont in his steerable balloon, which took place from the Place Masséna at 11.30 a.m. The intrepid aeronaut, who is a leading member of the Aero Club, nearly came to an untimely end, for, caught by a terrific hurricane when passing over Grasse, the balloon was carried upwards to a great height, and then dashed down among the trees of one of those woods which abound in the neighbourhood. It was only by a miracle that Dumont escaped death, and his balloon was badly damaged.

The following morning, Friday, March 30th, broke fine and clear, and an early start was made for La Turbie, to witness the hill-climbing contests which were timed to start at 10 o'clock. And in connection with this event it is necessary to chronicle a terrible accident. The victim was M. Wilhelm Bauer, one of the leading engineers of the Cannstatt factory, and the mishap came about in the following manner. Mounted on the German Daimler of M. Mercedes and accompanied by M. Brown, M. Bauer was driving the car for all she was worth, when in taking the first sharp bend on the hill he made a slight error in steering, and the car rushed at the wall bordering the route. M. Bauer promptly and forcibly applied his brakes with the result that the vehicle appeared to spin round on herself, and the unfortunate driver was shot out as from a catapult. He struck the rocky wall at the roadside, and although not killed on the spot he sustained such injuries to the head that he died at four o'clock on the following morning. The other occupant of the vehicle, M. Brown, received but very slight injuries, and can be congratulated on his marvellous escape, for at the moment of the mishap the car was travelling at certainly sixty kilomètres per hour. Apart from this terrible affair the competition passed off successfully, the official times being quoted as follows:—

Racing-cars.—1, Levegh (Mors), 19min. 2sec.; 2, Charron (Panhard), 19min. 15sec.; 3, Girardot (Panhard), 19min. 59sec.; 4, de Knyff (Panhard), 20min. 21sec.; 5, Hourgières (Panhard), 21min. 12sec.; 6, Pinson (Panhard), 23min. 55sec.; 7, Kœchin (Peugeot), 37min. 45sec.; 8, Labouré, 39sec. 50sec.; and Comte Boson de Périgord, who with three passengers made a time of 25min. 19sec.

Motor-cycles (not having finished the road race).—1, Gasté, 20min. 10sec.; 2, Marcellin, 21min. 16sec.; 3, Tart, 22min. 40sec.; 4, Bonnard, 25min. 30sec.; 5, Fernandez, 28min. 52sec.; 6, Baras, 30min. 23sec.; 7, Béconnais, 37min. 20sec.

Motor-cycles (having finished the road race, racers, or tourists).—1, Deville, 29min. 26sec.; 2, Floreo, 35min. 5sec.; 3, G. Richard, 48min. 10sec.; 4, Méaulne, 53min. 48sec.

Voituresses (not having finished the road race).—1, Théry, 31min. 21sec.; 2, Jules Dubois, 43min.; 3, Clérissy, 47min. 30sec.; 4, Van Berendonck, 63min. 55sec.

Voituresses (having finished the road race—tourists).—1, Ravenez, 47min. 33sec.; 2, Cornileau, 67min.

Touring-cars (weighing more than 1,000 kilos.).—1, Stead, 32min. 22sec.

Touring-cars (weighing less than 1,000 kilos.).—1, Liebig, 38min. 28sec.; 2, Cuénod, 49min. 21sec.

M. Levegh's time gives an average speed per hour of 53 kilomètres, and beats M. Lemaitre's last year's record by nearly six minutes. Béconnais made even faster time for the first portion of the route, but then a pinion came unkeyed and he was put hopelessly out of the hunt. Baras was also stopped by reason of the compression cock of his motor breaking, a somewhat curious accident. It is worthy of note that M. Liebig was driving the first Austrian-made automobile. Once the hill climbing was finished a general exodus was made for Monte Carlo, where the cars competing in the *Concours d'élégance* were quickly ranged up for inspection. Unfortunately, down came the rain again, and it was under most depressing circumstances that the judges were required to do their work. Their awards were eventually made as follows:—

Carriages of four or more places.—1, Edmond Blanc; 2, Desjoyeaux; 3, Gobron; 4, Brillié; 5, Hancy.

Carriages of two or more places.—1, Prince d'Oldenburg; 2, Johnston; 3, Stead; 4, Chauchard; 5, Dupin; 6, Duchâtel; 7, Recter.

Voituresses.—1, Serpollet; 2, Seigfried.

On Saturday morning, the closing day of this automobile week, the postponed mile race was run off on the cement foot-path of the Promenade des Anglais, and was favoured with glorious weather. Many of the *chauffeurs* had, however, left Nice, with the result that the race excited but a tithe of the interest that it would have done had it been decided on the day originally fixed. Proceedings commenced at about half-past four in the afternoon, and, as I announced some weeks ago in these columns, the times made by the various competitors were taken by means of an apparatus specially designed by M. Mors for the occasion. By this system the respective times for the mile and for the kilomètre with flying start were accurately ascertained, and the figures officially issued were as follows:—

		CARS.	
		Kilomètre.	Mile.
		S.	M. S.
1. Levegh	...	48½	1 32½

MOTOR-CYCLES (not having finished road race).

		SECS.	M. S.
1. Béconnais	...	39½	1 18
2. Gasté	...	46½	1 27
3. Marcellin	...	48½	1 31½
4. Baras	...	49½	1 32½
5. Joyeux	...	46	1 27½

Joyeux employed Gasté's tricycle, and beat one of his times.

MOTOR-CYCLES (having finished road race).

		S.	M. S.
1. G. de Méaulne	...	59½	1 51½

VOITURES.

		M. S.	M. S.
1. Van Berendonck	...	1 8	2 0½
2. Tart	...	1 9	2 1½
3. Clérissy	...	1 36½	2 50½
4. Guyenet	...	2 1½	3 28

STEAM AND ELECTRIC CARS.

		M. S.	M. S.
1. Serpollet (steam)	...	1 5½	2 0½
2. Prince d'Oldenburg (steam)	...	1 4½	2 3½
3. Notbeck (electric)	...	1 29½	2 30½
4. Hamilton (steam)	...	1 24	2 34½

M. Levegh simply had a walk over, and as he started badly, did not get the best possible performance out of his car, but Béconnais, on the other hand, achieved startling times. He covered the kilomètre with a flying start in the extraordinary time of 39 1-5 sec., which represents a speed of ninety-two kilomètres,

or fifty-seven and a-half miles per hour, and his figures for the entire distance of one mile made from a stationary start was 78sec., or at an average speed exceeding forty-six miles per hour.

In this trial, as in the Nice-Marseilles-Nice and La Turbie races, Béconnais was riding a motor-cycle fitted with a Soncin single-cylinder motor developing between five and six horse-power. The diameter of the cylinder is 86 mm. and the stroke 110 mm. The large pinion carries 98 teeth, and in the mile race Béconnais employed a small pinion of 26 teeth.

This performance more than recompensed the spectators for their previous disappointments, and it must also have been a source of great satisfaction to Béconnais himself, who had been pursued by bad luck throughout the meeting. With this event the Nice week came to an end, and it cannot be honestly said that the meeting achieved the success that was expected of it. The lamentable death of M. Bauer naturally cast a gloom over the festivities, and the miserable weather was not conducive to the enjoyment of the various items on the programme, but apart from these causes the defective organisation told heavily against the success of the fête. There was perhaps also a little too much of the idea that the competing automobilists were mere puppets placed at the disposal of the organisers for the purpose of entertaining their visitors, and as a natural consequence certain disagreements and unpleasantnesses arose. Certain it is that many automobilists will retain far from agreeable recollections of the Nice week of the year 1900, and if the organisers of the fêtes desire to maintain their meet as the premier in the South of France they must act more cordially towards those chauffeurs who contest the various events provided.

After the termination of the Nice Meeting many racing men betook themselves to Cannes for the purpose of competing in a hill-climbing race up the famous "Côte de l'Esterel." The distance required to be covered was 13 kil. 600 mètres, and the turnings were, if anything, more dangerous than those at La Turbie. Thanks, however, to capital organisation, the event passed off without a hitch of any description, and the spectators were treated to some splendid exhibitions of fast travelling. The official returns were:—*Motor-cycles*: 1, Béconnais, 14min. 44sec.; 2, Baras, 16min. 52sec.; 3, Gasté, 17min. 5sec. *Cars*: 1, Levegh, 16min. 23sec.; 2, Stead, 23min. 30sec.; 3, Boileau de Castelnaud, 27min. 6sec.; 4, Gondoin, 32min. 9sec.; 5, Liégard, 35min. 9sec. *Voiturettes*: 1, Van Berendonck, 31min.

In this race, as in the La Turbie contest, Béconnais used a small pinion with twenty-four teeth, and his ascent of the hill of Esterel was made at the speed of fifty-five kilomètres per hour. To see him, crouched low on his machine, taking the sharp corners of the route, as often as not on two wheels only, was a sight not likely to be forgotten by the spectators for many a long day. This race took place last Sunday, and upon its conclusion the competitors proceeded to put their affairs in order preparatory to setting out for Salon, where they were due to contest the two races organised for Tuesday and Wednesday last. The former was a course open to all cars and motor-cycles, and was to be decided over a route of one hundred kilomètres, while the latter was an event to be competed for by members of clubs associated to the Fédération Automobile du Sud-Est over a course of one hundred and eighty kilomètres, but full particulars of these two races will appear in next week's issue of the *Journal*.

MR. J. S. HARVEY informs us that it has now been practically decided to hold the Dieppe meeting on the 29th July and following days. On the 29th there will be the motor-cycle race from Paris to Dieppe. The programme of the international meeting will include a battle of flowers, an international race, a race for English drivers only, and a rallye—that is a paper chase—in the Forest of Arques.

MR. EDWARD LISLE, of the Star Motor Company, Wolverhampton, started from Wolverhampton at eight o'clock on Thursday morning last week to deliver one of his cars by road to Mr. A. J. Boulton, Barnet, reaching the latter place at 8 p.m. He states that the car went well throughout the journey, notwithstanding the muddy roads. Mr. Lisle made frequent halts on his journey, putting in quite a two hours' stay at Coventry.

CORRESPONDENCE.

GUARANTEEING AUTOMOBILES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although we hear much of the developments of the motor-vehicle, the only intimation the ordinary observer has of its existence is on seeing some case of furious driving reported in the police-court. Seeing that some few years have elapsed since the automobile was proclaimed as the vehicle of all vehicles that had come to stay—or rather to go—I really think we ought to see more upon the streets than we do at the present time.

The public is naturally shy at embracing a new hobby, and I fancy manufacturers should do something to secure general confidence by giving guarantees with all vehicles sold. Unquestionably such a policy led to confidence in the bicycle, and there are many men who, if the maker would guarantee the motor-car for, say, a year, would be quite willing to invest in such a vehicle.

Steadily are difficulties in the way of production being overcome, but of all these improvements the public are unaware. Early prejudice is not yet dispelled. What is required is that makers should give a guarantee to keep the vehicle they sell in order for a twelvemonth, and, even if they charged a higher price, the sale would certainly be much quicker than it is at present.

Yours truly,

CYCLE AGENT.

London, E.C., April 2nd.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With a view to acquire the information sought for by "Engineer" in his letter printed in your last journal, and, perhaps, to assist in the cause of automobilism, I have this month felt justified in purchasing a Werner motor-bicycle. I am not yet able to afford a favourable reply to "Engineer's" queries, but I hope that some other correspondent may offer the information which is asked for. I have not been able to travel more than about five miles without coming to a stop, either on account of mechanical, electrical, or calorific troubles, but conclude that as my experience extends I shall find that the "motor-cyclette" is destined to occupy a leading position amongst motors. However, it is pretty clear that anyone bent upon becoming a motorist cannot achieve that purpose more economically than by purchasing a motor-bicycle.

Yours truly,

J. A.

Altrincham, 31st March.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Engineer's" letter in your last issue, I have recently been riding a "Werner," and beg to give him the results of a not very prolonged experience. 1. The machine will run forty miles, say, at a good bit over twelve miles an hour without overheating. To put it in the orthodox way, I conclude that were legal restrictions removed the machine would average sixteen to twenty miles an hour or more. 2. There seems no reason why the engine should not last as well as a De Dion under similar conditions. It appears well made, and equally well proportioned to its work, but, of course, requires the use of the best lubricating oil to avoid fouling, and due attention to valves, etc. It is perfectly easy to manage, but if querist is not used to a free wheel a little practice with a free-wheel bicycle previously would facilitate matters. Steering is perfect, and owing to the belt drive there is none of that tendency to pitch rider off if engine stops or back-fires, which has been such a fatal objection to many bicycle-motors. I have not found the tendency to side-slip, so often ascribed to such machines, at all marked, at least on muddy country roads, but have not been on greasy asphalt, where few automobiles are quite free from it.

Perhaps some more experienced rider of one may reply, and if so I should be glad to know if it has been tried with one of the light French bicycle-trailers, and whether the latter affects the

steering, especially down hill. I find it a very comfortable machine, more so than a tricycle, at least to an old bicyclist.

Yours truly,
R. W. BUTTEMER.

St. Mary's, Godalming, April 2nd, 1900.

GEAR-CASES FOR MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I have had some inquiries from motor-car owners as to whether it was feasible to construct and fit successfully a dust-tight case for the chains of motors, I would like to say that I have just applied for protection (provisional) for a case to fill the requirements as stated below, viz.:—A case to be successful must be dust-tight and firmly fixed, yet able to move up and down with the wheels as the springs work; it must be silent and able to be detached in a few minutes. I should be pleased to forward you, for publication, drawings and particulars of same as soon as I have protected it, if you so desire; also, I should like to know if your readers are of opinion that a chain-case is a needed improvement on motor-cars in general; for myself I believe in casing in all working parts of motor-cars, to make them dust-tight, and so save undue wear.

Yours, etc.

March 31st, 1900.

DUST-TIGHT.

THE VICTORIAN DUTY ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some time past the Victorian Customs authorities have been assessing the duty on motor-cars imported into Victoria at the highest rate fixed for high class vehicles, that is, forty pounds (£40) each, and they also charged an additional duty of 30 per cent. on the value of the mechanical driving apparatus.

Owing to the difficulty of assessing the value of the motor power apart from the rest of the vehicle, the Commissioner of Customs has decided that motor-cars in the future shall be classified under the heading of "Vehicles not otherwise enumerated." The rate of duty will, therefore, be twenty-five per cent. (25 per cent.) *ad valorem*. Motor-cycles were assessed at 30 per cent. on the value of the engine portion, and the balance was subject to 11 per cent. under the heading of "Cycles."

As the above decision applied only to motor-cars, I wrote to the Department of Customs pointing out that motors and voiturettes were considered in Europe as belonging to a separate class, and asked whether they would be subject to the same rate of duty as motor-cars. I have just received a reply from the Department of Trade and Customs stating that, in their opinion, motor-cycles or voiturettes are dutiable at the rate of 25 per cent. It can, therefore, be taken as a settled thing that all motor-vehicles of any description that are imported into Victoria in future will be charged 25 per cent. duty by the Customs Department.

I might point out that this is really equivalent to 27½ per cent. on the invoice value of the vehicle, as 10 per cent. is added to the invoice price to cover the assumed cost of transporting the article from its place of shipment to Victoria, and the duty is then charged on the gross amount. There will no doubt be a revision of this rate when the federation of the Australian Colonies is completed, but the rate will in all probability be fixed at about 20 per cent.

Trusting that this information will be of service,

Yours truly,
KELBURNE EDGE.

305-307, Flinders Lane,
Melbourne, Victoria,
February 27th.

WE learn that the Still Motor Company of Toronto, Canada, will show, through Messrs. Shippey Brothers, their London agents, some new types of electric motor-cars, at the forthcoming exhibition at the Agricultural Hall. The cars will be equipped with the New Ideal storage batteries, for the development and manufacture of which in Great Britain a company is in progress of formation.

THE DAIMLER MOTOR-CAR.

(Continued from page 56.)

IN our last issue we published several views of the Daimler standard two-cylinder 6 h.p. motor. The Daimler Motor Co., Ltd., are also building a four-cylinder engine of 12 h.p., of which a general view is given in Fig. 6. As will be seen, this consists of a couple of the standard 6 h.p. engines mounted on the same bed-plate, and provided with a common crank shaft. This type of motor, which is generally known as the "Twin Daimler," is made for either pressure or gravity feed, as desired, and comprises all the special features referred to last week. Fig. 8 gives a view of the pump employed to keep up the circulation of the water between the cylinder jackets, the radiating coil, and the water tank. The pump, which is constructed largely of aluminium, is supported from one side of the crank chamber, and as will be seen from Fig. 3 (p. 55 ante) is driven by a pinion fixed close up to the fly-wheel on the motor-shaft. The next illustration (Fig. 7) gives a part-sectional view of the petrol storage tank which is located under the floor of the car. The figure shows the inlet hole in the centre with the outlet pipe immediately at the left; it will be noticed that the latter extends across the tank into a small hollow projection at the bottom, the supply of petrol for the carburettor being drawn from the bottom of the tank and up through the outlet pipe. As mentioned last week, the pressure in this tank is maintained by means of the exhaust. To the main exhaust pipe a short pipe is attached, to which is fitted the valve illustrated in Fig. 10. The function of this valve is to allow a small portion of the exhaust to pass through the pipe at each impulse of the motor, thereby keeping up the necessary pressure in the tank to force the petrol upward through the outlet pipe, the pressure pipe being connected to the flange joint seen at the top on the right of Fig. 7, and in the automatic lubricators referred to below. The valve, which can be regulated by the hand wheel shown, also acts as an escape valve, it being set to lift if the pressure become too great.

Passing over Fig. 11 which gives a view of the burners in the gravity-fed motor, we come to the automatic lubricators (Fig. 9). This is known as Drake's patent, and as stated above the device is worked automatically by the exhaust of the motor. There are, it will be seen, three outlets, one for each cylinder of the 6 h.p. motor and one for the crank chamber. This lubricator has been proved to give excellent results in practice and is now being fitted to all Daimler cars; it is located in the dashboard in full view of the driver.

(To be continued.)

MOTOR-CARS are to pay a toll of threepence once per diem on passing through the toll-gate in the College Road, Dulwich.

THE new works of the Fabbrica di Automobili Torino at Turin, Italy, were officially inaugurated a few days ago; they are said to cover an area of 12,000 square metres.

MR. VICTOR ASHBY, cycle and motor engineer, High Street, Towcester, is now carrying a stock of motor-car spirit and all accessories for automobilists. He is also able to undertake repairs to motor-cars and cycles of any kind.

TICKETS for the special dinner to be held at the Agricultural Hall on Wednesday, April 18th, in connection with the 1000-mile Trial may be obtained from the offices of the *Motor-Car Journal*, or from the Steward of the Automobile Club, price 2s. 6d. each (without wines).

WE learn that a new company has just been formed under the style of the Automobile Manufacturing Company, Limited. The new company, which has works and show rooms at North Street, Manchester Square, London, W.C., has acquired and will carry on the business of Messrs. W. C. Bersey and Co., and of the Southern Motor Car Company. At the forthcoming exhibition at the Agricultural Hall the new company, in addition to a large collection of accessories, will exhibit a "Georges Richard" and a new light steam carriage of English construction, known as the Express. We understand that the latter comprises many novel features.

The Daimler Petroleum-Spirit Motor.

(For Description see opposite page.)

FIG. 6.—GENERAL VIEW OF DAIMLER FOUR-CYLINDER 12 B.H.P. MOTOR.

FIG. 9.—DRAKE PRESSURE LUBRICATORS.

FIG. 10.—SECTIONAL VIEW OF PRESSURE-REGULATING VALVE.

FIG. 7.—PART-SECTIONAL VIEW OF PETROL TANK.

FIG. 8.—DAIMLER ROTARY WATER-CIRCULATING PUMP.

FIG. 11.—VIEW OF BURNERS—GRAVITY-FEED MOTOR.

THE AUTOMOBILE CLUB'S 1,000-MILE TRIAL.

INTEREST in this event continues to increase, and by Saturday, the 14th inst., the entries will be complete, that being the last day for both private owners and manufacturers to send in their applications to the secretary of the Automobile Club. On the same day the Exhibition at the Agricultural Hall will open, and on Wednesday, the 18th inst., the arrangements for the Trial will be detailed by the Hon. C. S. Rolls at a dinner at the Agricultural Hall. Then, on the following Saturday, there will be a meeting of all the 1,000-mile Trial vehicles for examination and sealing by the judges.

The start will take place at 7 a.m., on Monday, April 23rd, from the club house, Whitehall Court. Meanwhile the local arrangements are proceeding briskly and everything points to a very successful time. Below we record some of the arrangements which have already been made:—

BRISTOL.—The local committee has decided to abandon the proposed parade round the Downs, and to obtain estimates for a band to perform in the Drill Hall during the exhibition. The committee will also undertake the flagging of the route between Marlborough and Bath. On entering the city the cars will go *via* Victoria Street, St. Augustines, and Park Street to the Drill Hall, and leave *via* Whiteladies Road and Redland Road to Horfield Barracks, where the outward control ceases. There will be a fully adequate supply of petroleum spirit obtainable, and the public are showing considerable interest in the forthcoming event.

CHELTENHAM.—The cars are expected to arrive in Cheltenham about 11.30 a.m., and a short exhibition (under the patronage of the mayor) will be held in the Winter Gardens; the admission will be 1s. and the profits will be given to some patriotic fund. The cars will leave Cheltenham at three o'clock. The Cheltenham committee have undertaken to be responsible for that portion of the route which lies between the Cheltenham "inward control" and the Tewkesbury "outer control," and for the timekeeping duties at the latter town they have secured the assistance of Mr. Osborne, Mr. F. Paxman, and Mr. Palmer. The following are the gentlemen secured by Dr. Abbott to act as time-keepers at the Cheltenham Controls, viz.: Messrs. W. Turner, F.S.S., W. W. Whittard, B.A., E. E. Bick, T. George, W. Hughes, G. Rudge. Although no great effort has yet been made to dispose of the tickets, they are already going well, and there will no doubt be a considerable sale for them.

BIRMINGHAM.—Three members of the local committee at Birmingham went over the course between Worcester and Lichfield last Saturday and Sunday, and completed the organisation for the timekeeping. By order of the Chief Constable, competitors upon entering the Birmingham control, at Selly Oak, will proceed at 8 miles per hour until they reach the Horse Fair, a distance of 3 miles, whereupon they will have to further reduce speed to 6 miles per hour, until Bingley Hall is arrived at, a distance of $\frac{3}{4}$ mile. The same rate of speed (6 miles per hour) will be insisted on at the commencement of the outward journey, until Gosta Green, a distance of $1\frac{1}{4}$ miles, is reached, but from Gosta Green to Four Oaks Station, a distance of $8\frac{1}{2}$ miles, the limit will be 8 miles per hour. The exhibition will be held in Bingley Hall annexe. In Bingley Hall an Industrial Exhibition is proceeding, and the manager, Mr. Stanley, has invited through the local committee, all members of the Automobile Club to pass from the annexe to the main hall at their pleasure. As several military bands have been engaged no doubt this invitation will be cordially appreciated. The cleaning of the vehicles on the morning of the 26th will be done at Messrs. Mulliner's Gas Street Works, quite close to the exhibition buildings.

MANCHESTER.—The Chief Constable of Macclesfield has expressed his intention of assisting as far as possible, and Messrs. Coulthard and Co. will help in making the arrangements at Preston. Between Bakewell and the outward control for Buxton, Mr. J. Walton, the secretary of the Buxton Cycle Club, will do all that is necessary.

NEWCASTLE-ON-TYNE.—The Mayor of Newcastle will open the exhibition at the Drill Hall on May 5th, and there will be a reception of the Automobile Club in the evening. Mr. J. Duncan Hodgson has agreed to act as guide from Berwick to Newcastle.

LEEDS.—The size of the exhibition building at Leeds is 138ft. by 172ft., and the charges for entrance will be 1s. on the evening of May 7th, 1s. up to 5 o'clock on the following day, and 6d. after 5 p.m.

THE "ASTRAL" PETROLEUM-SPIRIT MOTOR.

MESSRS. LINFORD and WILLSON, of the Astral Works, Bell Barn Road, Birmingham, have just introduced a new horizontal petroleum-spirit motor, as shown in the accompanying illustration. The engine, which develops 4 b.h.p. when running at a speed of from 600 to 800 revolutions per minute, has a cylinder $4\frac{1}{2}$ in. diameter by 5 in. stroke. The water-jacket is so designed that it is claimed to be impossible for water to leak into the working space of the

cylinder. The inlet and exhaust valves are located one above the other at the end of the cylinder, and are so arranged that they can be readily removed. Special attention has been paid to the matter of lubrication, the crank working in an oil-containing case. This is provided with a detachable cover, so that the piston and connecting rod can be quickly withdrawn. The bearing surfaces are of phosphor bronze, and are specially large and well lubricated.

THE Safety Steam Automobile Company is a new Maine corporation registered with a capital of £300,000.

THE Maltby Automobile and Motor Company has just been formed in New York with a capital of £200,000.

LA SOCIÉTÉ DE LOCOMOTION ÉLECTRIQUE, of Paris (2 Rue Pasquier), is increasing its capital from £120,000 to £140,000.

AT a meeting of the Institution of Mechanical Engineers on Thursday, the 26th inst., Professor Hele Shaw will read a paper on "Road Locomotion."

MESSRS. SAUVAGE AND FRICK is the style of a new concern which has just been formed at Puteaux (4, Place de l'Eglise), France, to manufacture motor-voitures.

THE recently-formed Lincoln Motor Bus and Parcel Delivery Company, Limited, has, we learn, placed orders with the Daimler Motor Company, Limited, for four ten-seated wagonettes.

NOT only in this country, but also in the United States is the value of the automobile in improving the roads being recognised, and an American contemporary declares that the "automobile is one of the influences that is to broaden and smooth our roads."

THE Automobile Club of America has decided to hold a show of motor-vehicles at Madison Square Garden, New York, from November 3rd to 10th next. It is also intended to offer prizes for the manipulation of automobiles in action, such as in hill climbing, turning, stopping and starting.

MOTOR-CARS IN BELGIUM.

SOME OF THE EXHIBITS AT THE BRUSSELS SALON DU CYCLE ET DE L'AUTOMOBILE.

THAT Belgium means to keep well to the front in motor-car matters is well evidenced by the eighth Salon du Cycle et de l'Automobile which was opened at the Pole Nord, Brussels, on Saturday last, and which closes on Sunday next, the number of motor exhibits far exceeding those of cycles. We have not space to refer to all the exhibits, and those mentioned can only be dealt with briefly. In subsequent issues we hope to publish complete descriptions with illustrations of the more interesting vehicles. As was the case at the exhibition in Paris in December last, the feature of the show is the large number of two-seated voiturettes displayed.

M. L. Linon, ingénieur-constructeur, of Ensival-les-Verriers, Belgium, is the builder of the neat two-seated voiturette shown in the accompanying illustration (Fig. 1). The motor is located in the fore part of the frame; it is of the vertical type of 3 h.p.; the ignition is electrical, while for cooling purposes the cylinder is provided with radial ribs and the combustion chambers with a water jacket, the circulation being maintained by a small pump. Two speeds are provided, the power being transmitted by a single straight belt to fast and loose pulleys on an intermediary shaft at the rear; the pulleys on this shaft are of equal size, but each is connected to a pinion which gears with a corresponding pinion on the rear differential axle. The pinions work in a dust-proof case. Steering is controlled by a sloping hand-wheel, while ample brake power is provided.

The frame is spring-suspended on cycle-type wheels. The car, complete with oil and water, ready to start, weighs about 5 cwt. On the level, it can, it is claimed, attain a speed of 35 kilomètres per hour, while it will also mount gradients of one in eight. M. Linon also shows a car built on similar lines, but fitted with a 5-h.p. two-cylinder motor and three speeds, and a number of heavier cars built on the Gautier-Wehrle system.

Messrs. Ch. Wilford and Fils, of Tamise, near Antwerp, exhibit the 6 h.p. dog-cart illustrated in our issue of the 23rd ult., and a light three-seated car, which has been named the "Comfortable." It is fitted with a 3-h.p. water-cooled motor, located in the fore part of the frame. Belt driving is adopted; two speeds—10 and 35 kilomètres per hour—are provided. The car is well suspended, and fitted with pneumatic-tired wheels has a comfortable appearance. The steering is controlled by an inclined hand-wheel. Three brakes are available, one on the differential and one on each of the hubs of the rear wheels. A car very much on the lines of the Victoria Combination is shown on the stand of La Société des Usines Delin, of 7, Marché du Poisson, Louvain. It is fitted with a 2½-h.p. air-cooled motor, as is also the Delin motor-tricycle. A novelty is to be seen in the Delin motor-bicycle. This is fitted with a 1½-h.p. engine; it is fitted within the frame just in front of the bottom bracket. No pedals or chain gearing is provided, the motor driving

through a long shaft the rear wheel hub, by means of bevel gearing. La Fabrique Nationale d'Armes, of Herstal, exhibit the little two-seated car illustrated in the *Motor-Car Journal* for January 10th last.

An interesting exhibit is that of the Société des Ateliers Déchamps, of 31, Rue Frère Orban, Brussels. It comprises the Déchamps voiturette with 4½-h.p. motor already illustrated in these columns and the new four-seated Déchamps phaeton. This vehicle is fitted with a four-cylinder engine of 8-h.p., the diameter of the cylinders being 3 in. by 3½ in. stroke. The engine is located in the front part of the frame under a bonnet; it is air-cooled, the current of air being intensified by means of a fan driven off the motor. The combustion chamber is, however, water-jacketed. The transmission is by bevel gear to a counter-shaft, a single centrally-located chain connecting the latter with the rear axle. Three speeds forward—15, 30, and 45 kilomètres per hour—and three reverse motions are available. Steering is controlled by an inclined hand-wheel, the pillar of which is hinged at the bottom to facilitate mounting and dismounting. A car of this type is to be shown at the forthcoming exhibition at the Agricultural Hall, and will also take part in the 1,000-mile Trial. The

Déchamps Company also display a 2½ h.p. vertical air-cooled motor, and motor-tricycles fitted with the same.

La Société des Etablissements Pieper, of Liège, exhibit the light two-seated 3 h.p. petrol car illustrated in our issue of December 15th last, and also the combination electro-petrol vehicle. We published a short description of this car some months ago; we are now able to give illustrations, together with some additional particulars. The makers state that they "have tried

FIG. 1.—GENERAL VIEW OF LINON VOITURETTE.

to construct as light and as simple a carriage as possible, and have succeeded in giving to the assemblage of the driving power an elasticity which the petroleum-spirit motor alone does not possess. To this end we have coupled together a petroleum-spirit motor and a dynamo on the same shaft, which by means of a reducing gear of cog wheels drives the back axle of the car. The dynamo is connected with a small battery of accumulators, and the starting up of the motor is occasioned by passing the current of the battery through the dynamo by means of a rheostat. The electro-motor immediately starts turning, dragging the petroleum motor with it. It then only needs the regulation of the carburation and the opening of the gas admission tap to bring the petroleum motor quickly into action. As soon as this is effected, the dynamo works as a generator, and the power developed by the petroleum motor is transformed into an electrical current, which recharges the batteries. The dynamo is shunt-excited, and a rheostat placed in the circuit of the magnetic field enables the speed to be varied considerably. The common shaft of the dynamo and petroleum motor carries a friction cone, which enables its movement to be transmitted by means of spur-wheels to the rear axle. It will easily be understood that this disposition gives a great elasticity to the movement. During a stoppage all the power of the petroleum motor is utilised to recharge the batteries.

When the carriage is in motion the electro-motor acts as a generator or receptor according to the power required. If this power is inferior to that of the petroleum motor the surplus goes to the battery. If, on the contrary, it is superior to that which the petrol motor can supply (except at starting or during a steep grade) the speed of the motor lessens and the dynamo receives current from the battery, the power which it gives out being added to that of the petroleum motor. It will be noticed that all this works automatically without manœuvring on the part of the conductor."

Fig. 2 gives a general view of the car; Fig. 3 a view with body removed; while Fig. 4 represents a plan of the car, and shows the location of the petrol engine and the electro motor. The axles are connected together by two strong steel tubes p . To further ensure solidity four stiffening rods T are provided. Between the speed-changing shaft and the shaft of the electro-motor a flexible coupling is fitted to facilitate the dismantling of the latter.

In order also to be able to quickly transform the combination into a simple electrical carriage should the supply of petrol run out a coupling K is fitted, which, by a simple forward push, after loosening the nut N , cuts out the petrol motor. The current in the battery is sufficient for a run of twenty-five miles on level roads. It will be noticed that all the mechanism, with the exception of the accumulators, tanks, and carburettors, are placed on the

FIG. 2.—GENERAL VIEW OF PIEPER ELECTRO-PETROL CAR.

frame work, and are thus easily got at to clean or to dismount for repairing. The power of the petrol motor is so calculated that the battery is slightly charged on flat roads at the maximum speed of the car. Going down hill, the charging current rises considerably and the dynamo acts as a brake. In practice, the battery always remains charged; however, in the case when for some reason or other it gets exhausted, it can be recharged at a standstill by the engine. The variable-speed gear works in an oil bath, all the wheels being continuously in contact. On good flat roads an average speed of twenty to twenty-five miles an hour can, it is claimed, be attained, and ten miles on grades of about 12 per cent. Steering is controlled by a hand-wheel V . The road wheels are of the cycle type with pneumatic tires. The petrol motor is of $3\frac{1}{2}$ h.p., and is a single cylinder vertical engine with electrical ignition. The cylinder is cooled by cast iron fins, while the explosion chamber and valve boxes are provided with a water circulation. The water for cooling is carried in a small tank above the motor, a radiator being also fitted. The electric motor is hermetically closed in a gear case and develops $2\frac{1}{2}$ h.p. The battery, weighing about 250 lbs., consists of forty elements placed in ebonite boxes with double lids so as to prevent any spilling of the acid. Two brakes are provided, worked by pedals; the first acts on the main shaft, the second on drums F near the hubs of the rear wheels. A reverse motion is effected by means of the starting rheostat, which at the same time cuts off the gas, leaving the electro-motor to work the car alone. The

total weight of the car in running order is about 800 lbs. La Société de Construction Liégeoise d'Automobiles, 83, Rue Lairesse, Liège, who have lately acquired the Belgian rights in the American Duryea vehicles, show a two-seated car of this type and a four-seated dogcart. Several cars very much on Daimler lines are shown by La Compagnie Belge de Construction d'Automobiles, Place du Chatelain, Brussels. They are, however, fitted

FIG. 3.—VIEW OF PIEPER ELECTRO-PETROL CAR WITH BODY REMOVED.

with a two-cylinder 6-h.p. vertical motor, known as the "Pipe." Four speeds forward and a reverse motion are provided, the transmission being effected by pinions and chains. A big display of vehicles is made by La Société des Ateliers Germain, which has large works at Monceau-sur-Sambre, the company controlling the Belgian rights in the Daimler and Panhard patents.

Les Ateliers Vivinus, 54, Rue Destouvelles, Brussels, show their "Vivinus" car, which is now being made in this country under the name "New Orleans," by Messrs. Burford, Van Toll, and Co. Messrs. Antoine Fils and Co., of 43, Quai St. Leonard, Liège, exhibit motor-tricycles and quadricycles fitted with a new air-cooled motor of $2\frac{1}{2}$ h.p., and known as the "Kelecom." They also show a neat two-seated car fitted with a 4 h.p. water-cooled "Kelecom" motor. The car has a tubular frame, the engine being located in the front portion. Two speeds are available, and the steering is controlled by a sloping hand-wheel. The Koch heavy oil car is shown by the Société des Automobiles Koch, of Clichy, near Paris; the Peugeot cars by the Peugeot Company, of Audincourt (Doubs); Vincke cars, fitted with "Ideal" motor, by Les Ateliers Vincke, of Malines; Gobron-Brillié "Silent" cars by M. L. Nagant, 49, Quai de l'Ourthe, Liège; Benz cars by M. A. Baut, of Courtrai; Panhard cars by Le Cycledrome-Automobile, Ancien Marché de la Rue de la Loi, Brussels; Delahaye cars by Messrs. J. Alberts and Co., 19, Rue St. Georges, Ghent.

New voiturettes, of which we hope to give particulars in a later issue, are shown by M. Foidart, 141, Rue de Merode,

FIG. 4.—PLAN OF PIEPER ELECTRO-PETROL CAR.

Brussels; Messrs. S. De Jong and Co., of Berchem, Antwerp; Messrs. Foidart and Rosenthal, 63, Quai du Hainaut, Brussels. Electric cars are displayed by M. L. Lefert, of 17, Rue du Poivre, Ghent, and La Compagnie Internationale des Transports Automobiles (Jenatzy), of 56, Rue de la Victoire, Paris. The foregoing are the principal exhibitors; in addition there is a large number of firms showing motor-cycles and accessories.

THE MONTAUBAN-MARCHANDIER VARIABLE SPEED GEAR.

AN improved variable speed gear for motor-vehicles has recently been introduced in France by Messrs. Montauban and Marchandier, of St. Quentin (Aisne), of which an illustration is given herewith. The claim for the new gear is its compactness, it being enclosed in an aluminium oil-containing case. The latter is built up of two parts bolted together and rendered oil-tight by a packing of leather. Three shafts are arranged in this case; the first is merely an extension of the motor shaft, with which it can be thrown in or out of engagement as desired by means of a friction clutch. The second shaft, *B*, parallel to the rear road wheel axle of the driving-wheels, is provided with two bevel-wheels, *a* and *b*, engaging a third on the motor-shaft. These three gears, when the friction-clutch is thrown into engagement with the motor-shaft, are rotated. Between the two bevel-wheels a clutch is mounted, having teeth adapted to interlock with teeth on the gears, the carriage being propelled forward or backward by throwing the clutch into engagement with the proper gear.

On both sides of the bevel-wheels *a* and *b*, and on the same shaft, are mounted the spur-wheels 1, 3, 5, 7, meshing respectively with the gear-wheels 2, 4, 6, 8 on the shaft *C*, and giving four different changes of speed. Between each pair of gear-wheels 2-4 and 6-8, which are loosely mounted on the shaft *C*, is another clutch, which when thrown to the right or to the left engages one of the pairs, 2-4 and 6-8.

In order to have but one set of gear-wheels in operation at

a time, the lowermost shaft is made in two sections, projecting from both sides of the casing and carrying at each end a small sprocket-wheel, which transmits the movement to the rear driving-wheels. In order to throw each pair of the gear wheels, producing the different changes of speed, successively into operation, each clutch is thrown by means of a fork, carried by a rock-shaft and operated by a crank-arm. The crank-arms are engaged by cam-grooves on the drum *D*. By rotating this drum, the pairs of gear-wheels can be successively thrown into or out of mesh. Less than one revolution, it is claimed, suffices to pass from a complete rest to full speed, or to stop and reverse. The drum *D* is operated from the driver's seat by a hand-wheel, two small sprocket-wheels, and a bicycle-chain. The gear is being made in several sizes suitable for cars of from 3 to 12 h.p.

THE Simplex Motor Vehicle Company has been incorporated at Kittery, Me. U.S.A., with a capital of £100,000.

THE Leesdorfer Automobilwerke Gesellschaft is the name of a new company which has just been formed at Baden, near Vienna.

M. LEON LEFEBVRE, of 12, Rue Emile Allez, Paris, the maker of the "Boule" car, informs us that he has converted his business into a company, under the style of Messrs. Leon Lefebvre and Co., with a capital of £7,000.

THE Duryea Power Company has just been incorporated under Pennsylvania laws to build motor-vehicles at Reading, Pa., under the supervision of Mr. Charles E. Duryea, in other designs than those turned out by the Peoria Company. Among the vehicles manufactured will, it is said, be hansom cabs for city use. The capital is £20,000.

THE PHILIBERT-BOURDIAUX MOTOR.

ONE of the new petroleum-spirit motors which attracted attention at the recent cycle and motor-car show in Paris was the Philibert-Bourdiaux, introduced by M. E. Delalande, of 103, Rue Saint Maur, Paris, and of which an illustration is given herewith in Fig. 1. As will be seen, the motor has two cylinders, parallel and bolted close together to a common base chamber. On the outside of each cylinder is turned a helical groove of small pitch, in which are fitted a series of copper plates *F* for cooling purposes, the bore of which corresponds to the diameter of the bottom of the grooves in the cylinders. These plates are cut across to permit of fixing or withdrawal, while to increase the cooling surface they are corrugated. A feature of the motor is that there is only one crank for the two cylinders. The piston of the cylinder *A* is connected to the crank shaft by the rod *M*, while the piston of the cylinder *A'* transmits its motion to the head of the

same rod by arms *OO'* connected together by the compensating balance arm *P*. This arrangement, it is claimed, greatly simplifies the mechanical control of the motor and reduces the vibration, and enables two cylinders to be employed, which can be more easily cooled than one large one. The motor weighs only about 22lbs., and is claimed to develop 3-h.p. at 2,000 revolutions per minute. The explosion chambers *B B'*, the outsides of which are provided with cooling fins, are held in position by the stays *D D'*. *G* is the admission valve of the cylinder *A*, and *H* is its exhaust valve, mechanically operated by a tappet *S* and a cam shaft driven off the motor shaft by the pinions *R Q*. The valves *G H*, and the inlet pipe and exhaust outlet *K*, are of large section, in order, it is stated, to assure the regular working of the motor at the high speed. The ignition is electrical, the sparking plug being located at *I*, between the inlet and exhaust valves.

THE Wilkesbarre Automobile Company has been organised at Wilkesbarre, Pa., to introduce public electric vehicles there.

THE KÜHLSTEIN-VOLLMER PETROL CAR.

IN addition to the Kühlstein-Vollmer *avant train* illustrated in these columns last year the Kühlstein Wagenbau Gesellschaft, of Charlottenburg, Germany have lately introduced the two-seated car illustrated in Fig. 1 to 4. The frame is built

FIG. 1.—GENERAL VIEW OF KÜHLSTEIN-VOLLMER PETROL CAR.

up of channel steel, and carries the motor and the whole of the transmission gear. As will be seen the motor is located centrally in the rear part of the frame. It is of the horizontal two-cylinder type, with water jacket and electric ignition, and is stated to be capable of developing 5 h.p. The water-circulation is maintained by a pump; the carburettor is a gravity-feed one

FIG. 2.—REAR VIEW OF KÜHLSTEIN-VOLLMER CAR, WITHOUT BODY.

of a special type. Three forward speeds—8, 18, and 35 kilomètres per hour—are provided, as also a reverse motion; the power of the engine is transmitted by a single belt to a counter-shaft spur-wheels, forming the variable-speed gear, connecting

this with the differential shaft, from which the power is transmitted to the rear axle by the usual sprocket-wheels and chains. The crank of the motor and the variable-speed gear work in oil-containing cases. The body is quite independent of the frame, to which it is attached by six bolts; the water tank, which has a capacity sufficient for a run of 100 kilomètres, is located in the fore part of the frame, a *refroidisseur* or coiling coil being introduced in the circuit. The wheels are of wood shod with solid rubber tires, while tiller steering is provided. The weight of the car complete is given as 700 kilogrammes or about 14 cwt., the makers stating that their object has been not to construct a light vehicle but one which will withstand the jolting and vibration caused by bad roads. We are indebted to *Die Automobile* of Berlin for the illustrations.

AN AUTOMOBILIST'S COAT.

LOVERS of the automobile will be glad to know that their sartorial wants are being studied and adaptations made to present-day styles of garments to meet the special requirements of their sport. Messrs. Burberry's (of 30, Haymarket, S.W.) "Automo Slip-on" is an overcoat combining the wind and rain resistance usually only found in mackintosh, the warmth holding and naturally hygienic qualities of the travelling ulster, and the lightness characteristic of the dust or covert coat. Built on their patented plan of combination, the outer surface is the well-known gabardine, while the inner lining, coming next the wearer, is a delightfully soft, light, thick, pure camel fleece, of a natural undyed colour, forming a coat so snug and warm that the greatest comfort is maintained in the bitterest winds or when travelling at the top speed of the motor. Add to this that the coat is capable of turning the heaviest continuous downpours without impeding in the slightest degree the free passage of air through the pores of the cloth, the motorist will see that this garment overcomes many of his chief difficulties so far as an overgarment is concerned.

The design of the "Slip-on" is such as to provide fulness at the knees, acting in itself as a rug, cut with the further advantage that, in addition, the motor-carriage apron may be wrapped round the knees under or over the coat as preferred. Carriage aprons are made of the same materials and supplied with the coat. They afford more protection and natural warmth than either box cloth or mackintosh, and are necessarily more pleasant to use. Messrs. Burberry's secret of success is their plan of proofing, which has long held the forefront in the battle of the proofers. Experience shows that this proofing lasts practically as long as the materials, and though quite as efficient as mackintosh in turning rain, the air passages of the cloth are as open as those of ordinary unproofed materials, as can be proved by blowing smoke through.

THE Foster Automobile Company has been formed at Rochester, New York, to manufacture steam and electric carriages. The capital is £20,000.

THE Motor Manufacturing Company, Limited, of Coventry and Holborn Viaduct, E.C., have arranged to take up the manufacture of De Dion air-cooled engines of 2½ h.p.

THE *Western Electrician* states that the last three or four months have witnessed a marked increase in Chicago in the popularity and number of electric automobiles.

THE Denison Electrical Engineering Company, New Haven, Conn., are building an omnibus for Mr. George D. Jones, of Torrington, Conn., to carry nine passengers and baggage. The motor is a 12 h.p. Yale two-cycle petrol engine, and the vehicle complete will weigh about 2,000 lbs.

THE Baldwin Cycle Chain Company, of Worcester, Mass., U.S.A., has sent us a copy of the list of motor-car and cycle chains it has just issued. The list gives particulars of Baldwin block chains ranging from 1 in. pitch $\frac{5}{16}$ in. wide, up to 2 in. pitch 1 in. wide, and of roller chains from $\frac{1}{16}$ in. pitch to $1\frac{1}{2}$ in. pitch.

CARRIAGE BUILDERS AND AUTOMOBILES.*

By WILLIAM PHILIPSON.

IF an impartial inquiry were made, I doubt whether it would be found that coach makers are either so conservative or so slow in their relations to the motor-car movement as some people would have us believe.

we must employ it in large vehicles like omnibuses and wagons, but here we are hindered by the restrictions laid down as to weight and speed by the Local Government Board.

During the past three years my firm has received scores of applications from potential buyers of automobile vehicles. The three chief purposes for which such vehicles are needed are for passenger traffic in towns where there are no tramways, for country districts where light railways have been projected for

bringing people and farm produce into towns, and for the delivery of goods within a radius of, say, ten or fifteen miles, at a smaller cost and with less risk of breakage and delay than is the case when sent by railway. As the law stands, however, we are not allowed to produce such a vehicle with the requisite degree of reliability and strength, because if a certain weight is exceeded then the law steps in and restricts the speed to a useless rate.

And now as to the oil motor. No one with any knowledge of the subject would attempt to deny that up to the present it is far ahead of all others. One may say without exaggeration that all the cars running in Great Britain and Ireland to-day—and there are several hundreds—are propelled by oil motors.

To the coach maker it is immaterial whether the car is provided with electric or lamp ignition; they are all disagreeable, stinking things, but if the oil motor does the work of moving the car and its load -

FIG. 3.—VIEW OF KÜHLSTEIN-VOLLMER CAR FROM RIGHT-HAND SIDE. (For description see opposite page.)

The electric motor is the one to which coach makers very naturally incline, owing to the absence of noise, vibration, heat, and smell. It may be kept charged ready for work at a moment's notice, night or day, and if provided with duplicate batteries, it is ready for a second journey after finishing its first. No doubt the working cost per mile comes out heavier than is the case with oil or steam, but when we obtain greater reliability and a reduction in the weight very little will be heard about the expense.

At the present moment the steam motor is the only elastic one we have, i.e., the only motor that will adjust itself to all roads, be they wet or dry, hilly or level, and whether the car be full or empty. By the steam valve we can regulate our power to a nicety without having recourse to complicated speed gearing, which adds weight, noise, and friction, and a part that is always requiring repair. To utilise the steam motor to the fullest advantage, however,

FIG. 4.—VIEW OF KÜHLSTEIN-VOLLMER CAR FROM LEFT-HAND SIDE. (For description see opposite page.)

A MOTOR-CAR CONTRACT.

IN the Queen's Bench Division last week, Mr. Wm. Gibson (instructed by Mr. D. S. Doyle), in the case of Joynt v. Hewetsons, Limited, moved on behalf of the plaintiffs for leave to issue a writ out of the jurisdiction, and to substitute service on Mr. Wm. McTaggart, of Dublin, agent for the defendant company, whose offices are in London. The action is to recover £25 3s. 6d. for breach of warranty in the sale of a motor-car to the plaintiff, and for breach of contract, and for money paid for the defendant's use.

Mr. Justice Boyd said the writ need not be served out of the jurisdiction, but could be served on the agent of the defendant company on an order to substitute service on him being made. He granted an order in the altered form.

AFTER A COLLISION.

EDGE v. WESTON.

BEFORE Mr. Justice Ridley and a common jury this case was heard at the Law Courts, London, on Friday. The plaintiff brought the action to recover damages from the defendant for injury done to a motor-car, owing to the alleged negligent driving of the defendant's servant. The defence denied that there had been any negligence, and there was a counter-claim for damages done to the defendant's cart owing to the plaintiff having run into it with his motor-car.

The case for the plaintiff was that on October 5th, 1899, he was proceeding along the Euston Road from the place where he stabled his machine on his way to a meet of the Automobile Club in Whitehall Place. He was driving a machine which was valued at £830, and weighed about a ton. The collision occurred at the crossing of Howland Street and Fitzroy Street, he having travelled down the latter street at a moderate speed. When the plaintiff arrived at the crossing there was a two-horse van in the way. He slowed down for the crossing and passed in front of the van, and when he had got across to where Charlotte Street faces Howland Street, there shot out from beyond the pair-horse van a light cart belonging to Weston, travelling at so rapid a pace that the plaintiff was unable to avoid it, and the horse and shafts of the trap came full into the motor-car, injuring it in various ways. The plaintiff, after having some conversation with the defendant's son and another man named Cavill, who were in the trap, sent for a workman who temporarily put the machine right, and Mr. Edge attended the meet and went to Oxford and back, although the machine was not running as well as usual. On returning to London he found that the motor-car was badly damaged. The repairs necessitated cost £42, and its selling value was greatly depreciated.

Mr. Edge was cross-examined by Mr. A. H. Poyser to endeavour to show that he was in the habit of riding at a high speed. He said that he was not in the habit of riding fast through towns. He had ridden from Holborn Town Hall to Coventry on a motor-cycle at the rate of twenty-three miles an hour.

In re-examination he said that he had never when riding in a motor-car run into, or been run into, by anything until the present occasion.

On behalf of the defendant, evidence was given to the effect that the plaintiff's motor-car was being driven at a furious pace, and that the hooter was not used at the crossing. The two-horse van which was in the road turned to avoid a collision, and the defendant's cart, which was behind the van proceeding at a trot, was run into by the motor-car with such violence that both the shafts were broken and the horse turned completely round, so that his head was where his tail ought to be. The defendant's son and Cavill were both thrown out, and the trap was damaged.

After the addresses of counsel, his Lordship summed up the case to the jury, who returned a verdict for the defendant on the claim and on the counter-claim, with £15 damages. Judgment was given accordingly.

CAVILL v. EDGE.

In this action, which arose out of the facts in the foregoing case, Cavill, who was in the cart when the accident occurred, sued to recover damages for personal injuries sustained by him. By arrangement a verdict for the plaintiff for £15 was taken.

CHARGE AGAINST A DIRECTOR.

AT the Central Criminal Court on Monday, the Recorder (Sir Forrest Fulton, Q.C.), in charging the Grand Jury in the case of Sydney Frederick Atkins, on bail, who stands indicted for that he, being a director of the Automobile Association, Limited, did fraudulently apply to his own use the several sums of £16, £22, and £44, the moneys of the said company, said the accused was formerly in the employ of the company, but was found to be a clever practical man and was made a director with the view of pushing the sales of the company. The charge against him was of having applied three cheques to his own use. It was quite certain the cheques were drawn, and that the money was obtained upon them, but there was no direct evidence that the money went into the pocket of the accused. His defence was that he was given a general authority to draw cheques for the purpose of paying secret commissions, and he apparently pleaded that the money had gone in that manner. The case was one which, he thought, should be fully investigated by a petty jury, and he therefore advised the Grand Jury to return a true bill in order that that might be done.

THE MOTOR MANUFACTURING COMPANY.

THE shareholders of the Motor Manufacturing Company, Limited, met last week, and confirmed the resolutions passed on the 15th ult. for the reconstruction of the company. The chairman moved the following resolutions:—1. "That it is desirable to reorganise the company, and that with a view thereto the company be wound up voluntarily." 2. "That a new company with the same or some similar name, and memorandum and articles of association, to be approved by the liquidator of this company, be formed." 3. "That the draft agreement submitted and expressed to be made between this company and its liquidator of the one part and the said new company of the other part, be and the same is hereby approved, and that the said liquidator be and he is hereby authorised, pursuant to Section 161 of the Companies Act, 1862, to enter into an agreement with such new company (when incorporated) in the terms of the said draft, and to carry the same into effect, with such (if any) modifications as he may think fit." On the motion of the chairman, Mr. J. H. Gretton, seconded by Mr. Buckea, Mr. Alfred Burgess (secretary) was appointed liquidator, without remuneration.

THE Automobile Club meet and dinner at the Sheen House Club takes place to-morrow (Saturday). The start is fixed for 3 p.m. at the Horse Guards Avenue.

THE HON. C. S. Rolls has arrived from Paris with a new 12 h.p. Panhard car which is to run in the 1,000-mile trial. It is fitted with both tube and electrical ignition, which are at times used simultaneously. It is probable that this duplex ignition will be fitted to many Daimler cars in the early future.

MR. EDWARD S. CLARK, of Dorchester, Mass., has just completed a steam-delivery wagon for a firm of bakers in Boston, Mass. The wagon weighs 1,750 lbs. with all supplies on, and has a 63-in. wheel base. The engine is a double-cylinder reversible, giving 8 h.p. at 400 revolutions. The vertical shell boiler contains 650 $\frac{1}{2}$ -in. tubes, giving 90 sq. ft. of heating surface. A double burner is employed, a spray burner heating up the main burner in about two minutes. Steam can, it is claimed, be raised in about seven minutes from the time of lighting the burner. The wheels, 32 and 36 in. respectively, are shod with $1\frac{1}{2}$ -in. solid rubber tires.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. II.]

LONDON, FRIDAY, APRIL 13, 1900.

[No. 58.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE 100-mile Non-stop Road Trial organised by the Automobile Club took place on Wednesday last, but owing to our going to press a day earlier this week on account of the Easter holidays we are unable to give the results in this issue. The start was fixed to take place shortly after 10.30 a.m., the route being *via* Uxbridge, Beaconsfield, and High Wycombe to the 52nd milestone from London and back. Six cars had in all been entered for the competition, viz., two De Dion voituresses by the De Dion and Bouton Syndicate, Limited, a Marshall phaeton by Messrs. Marshall and Co., an Ariel quadricycle by the Ariel Cycle Company, a New Orleans voituress by Messrs. Burford, Van Toll and Co., and Mr. Mark Mayhew's 8-h.p. Peugeot car, illustrated in our last issue. As Messrs. Marshall and Co.'s driver was taking their motor-car to the start of the Trial in the morning he was run into by a London and North-Western Railway van. The car was seriously damaged and the driver much shaken, whilst the railway van driver is reported to have whipped up his horses and galloped away. We understand that Messrs. Marshall and Co. have put the matter in the hands of Mr. Staplee Firth, with a view of obtaining damages against the railway company.

The Motor-Car Exhibition.

AN application—the Agricultural Hall Company, Limited, *v.* Cordingley and Co.—was heard in the Law Courts on Wednesday, when it was agreed, without prejudice to any further question, “that the defendant may exhibit twenty-five, but not any greater number of bicycles and tricycles. The defendant undertakes not to show or exhibit, or allow to be shown or exhibited at the Hall (1) any greater number of bicycles or tricycles than twenty-five altogether, whether the same shall be moved by mechanical motors or other mechanical means or otherwise; (2) or any accessories other than accessories for or applicable to motor-cars.” This undertaking does not in any way interfere with the exhibition as previously arranged, and will not exclude a single exhibitor.

The Hon. C. S. Rolls.

AMONG automobilists the Hon. C. S. Rolls is well known, and they will read with interest the interview which we publish on another page. Accompanying the report of that conversation is an illustration of the new 12-h.p. Panhard car which Mr. Rolls has recently brought over from Paris. The owner is seated at the helm, and has another well-known automobilist by his side. Mr. Rolls is sanguine with regard to the future of the industry, and gives emphasis to some of the views presented by the Hon. J. Scott Montagu in his recent paper read at the Automobile Club. His views on the value of racing in improving the designs of cars are valuable, but whether motor-car races are likely to prove a permanent addition to our

British excitements is a matter on which difference of opinion is found among automobilists.

Combination Electric and Tube Ignition on Motor-Cars.

IN our last issue we briefly referred to the fact that the Hon. C. S. Rolls' new 12-h.p. Panhard car is fitted with both electric and tube ignition to the motors. In connection with this question our Paris correspondent writes:—“During a capital run that I had with the Hon. C. S. Rolls on his 12-h.p. Panhard from Paris to Havre last Saturday week, not the least interesting feature of the drive was the effect produced upon the speed of the car by the employment of electric in combination with tube ignition. Immediately the switch was put over, the pace of the car increased very considerably, only to diminish instantly that the current was cut off. We had no opportunity of actually noting the difference in time over a kilometre, but I fancy that, comparatively speaking, it must have been very considerable. That the car was not absolutely dawdling along may be judged from the fact that on the level we timed her over many kilometres to be doing from 53 to 56sec. for the kilometre. From Saint-Germain to Havre the distance by road is 200 kilometres, the half-way house, Rouen, being about 108 kilometres from the former place. Leaving Saint-Germain at 9.30 we travelled by way of Chambourey, Flins, Mantes, Rosny, Bonnières and Gaillon, descended the famous “Trou du Diable,” and then *via* Pont de l'Arche to Rouen, where we arrived at midday. Half an hour we spent in that ancient city, and then, resuming our journey, we ran over the last 92 kilometres in 1h. 40min.—fast travelling when it is considered that Mr. Rolls drove slowly through the villages, with the exception of one, where the entire absence of visible inhabitants and the presence of an extremely wide straight stretch of road tempted him to travel at a speed considerably in excess of that permitted in Piccadilly, for example.”

Run to Sheen House.

FIFTEEN cars took part in the Automobile Club's run to Sheen House, Richmond, on Saturday last. The outing was a very enjoyable one, and after tea many of the ladies and gentlemen participating went for a drive round Richmond Park. We were on a De Dion voituress, which had three passengers, and took every hill except one at top speed. The dinner in the evening was well attended, and, as is usual at Sheen House, was well served. Such runs as these are useful, not only as giving opportunity for social intercourse among the members of the Automobile Club, but also as a means of increasing the interest of Society in automobilism. By inviting their friends to participate in such outings members can do much to help the popularisation of the pastime.

London to Paris.

DURING the week a new venture has been started which might, in our opinion, have been improved by the adoption of motor-vehicles. We refer to the trips, “London to Paris by Coach.” Starting from Piccadilly, four-in-hands go to New-haven *via* Brighton, and coach, horses, and passengers are put on

board a steamer to be taken to Dieppe. Then along the valley of the Seine the travellers will enjoy some of the finest scenery in northern France. Not more than thirty miles will be run on any day, and on some occasions the progress will not exceed twenty-five miles. The fare for a box seat is twenty guineas, for a seat facing the horses fifteen guineas, and for any other position twelve guineas. The first coach started on Monday morning, and the party should reach Paris next Tuesday morning or Monday evening. The success, or otherwise, of this idea will probably be keenly watched by automobilists.

Excursions by Motor-Car.

SHOULD there be a sufficient number of patrons for such a venture, the motor-car industry should receive great encouragement, and the inauguration of a similar notion, using motor-vehicles instead of horses, need not be long delayed. For while short trips and day excursions have hitherto been the practical limit of public service enterprise, the automobile is essentially adaptable to longer tours and for such excursions as those which are to be organised by the concern to which reference was made in a recent issue. We hope to see a great extension this summer in the use of motor-vehicles for pleasure parties, and owners of such charrs-à-bancs as the "Balmoral" ought to have little difficulty in securing patronage.

The 1,000-Mile Trial.

OUR Paris correspondent writes:—"I am told by the representative of the Automobile Club of Great Britain that M. Ravenez and MM. Albert and Georges Lemaitre, the three members of the 'A. C. F.' who had signified their intention of participating in the English 1,000-mile trial, have now intimated their inability to take part in this tour. This is to be regretted, for the majority of members of the French club have but a poor opinion of English automobiles, and actual participation in this event would have done much to prove to *chauffeurs* here that English-made cars are not so bad as they picture them. I understand that M. Ravenez, who is chairman of the Decauville Company, will probably visit London in order to witness the start of the tour."

An Enterprising Lady Motorist.

WE have already referred in these columns to that enterprising lady, Miss N. G. Bacon, in entering the ranks of lady motorists, and her riding on a Werner motor-bicycle. Apparently she has now got quite accustomed to the machine and its little ways, for we understand that she has just purchased one on which she proposes to take part in her professional capacity as a journalist in the forthcoming 1,000-mile Trial. Thus we shall have two ladies driving their own conveyances—Mrs. Bazalgette and Miss Bacon—in the coming Trial.

The Scotte Tractor.

ALL visitors to the Paris International Exhibition will certainly not fail to remark in the Siberian section at the Champ de Mars four immense railway passenger cars, built and exhibited by La Compagnie Internationale des Wagons-Lits, and automobilists will give them particular attention if only on account of the manner of their transport from Saint-Denis, the scene of their construction, to the place which they now occupy. Weighing no less than 35,000 kilos each, the work of conveying these monster cars would have been a very difficult operation a very few years ago, but to-day, thanks to the progress of automobilism, their transport was readily effected. A Scotte tractor of 27 h.p. was harnessed to this railway house—mounted on a low carriage—and each of the cars was towed safely over the 13 kilometres of road separating Saint-Denis and the Exhibition. The first journey was made during the night of the 5th inst., and the others followed during the subsequent evenings. Starting from Saint-Denis at 9.45 p.m., the tractor and its load, accom-

panied by another Scotte engine and a steam omnibus, made good progress until the Porte d'Asnières was reached. Here a halt was made until 1 a.m., as the police authorities feared that the huge mass would seriously disturb the traffic of the metropolis. Paris was entered at the authorised hour, and upon commencing the ascent to the Place de l'Etoile the services of the accompanying tractor were called into requisition. Once the hill had been overcome, the rest of the journey was quickly accomplished, and at 3.30 a.m. the first of the *wagons-lits* had been installed in the Exhibition. The transport of the others was as readily achieved.

Motor Races at the Crystal Palace.

MR. F. W. BAILY informs us that the arrangements for the cycle and motor race meeting on the track at the Crystal Palace for Easter Monday are now complete. As last year, it is proposed to divide the races into two separate items. The first will be the motor-cycle races held by the Motor-Car Club at 12.30. These races will comprise a one-hour race for the Crystal Palace Brassard between F. F. Wellington, R. Moffat Ford, C. Jarrott, and S. F. Edge. Besides this, there will be a ten-mile scratch race for racing machines and a five-mile handicap for roadsters. This should make a very attractive programme. The cycle races will take place at 4.30, and in order to complete the programme, and to test the question of the superiority of the French or English pacing motors, races for these machines are being held.

Mechanical Traction in South Africa.

THE enforced delay in the progress of the British troops in South Africa owing to the failure of the horses should prove a weighty argument with our military authorities, especially as so much excellent work in connection with the transport arrangements has been done by traction engines—of which more than a score are now being successfully employed. From an answer given to Mr. MacIver in the House of Commons on Friday, it appears that Lord Roberts is considering whether additional means of traction of that character could be usefully employed. The forced marches latterly undergone seem to have caused great difficulties among the horses—which would never have arisen had mechanical traction been more freely employed.

Cyclists and Motor-Cars.

MR. CHARLES JARROTT does well, before the commencement of the touring season, to call the attention of cyclists to the folly and danger of "hanging on" to motor-cars. To the cycling press he has addressed a letter instancing an accident which has occurred on the Ripley road owing to this bad practice, and every motorist could probably give some more or less painful examples of accidents arising from this cause. We do not object to cyclists taking advantage of the pacing afforded by automobiles, although it is not always pleasant to have a total stranger following in one's wake, but we do object to their approaching within a few feet of the vehicle and then looking angry if knocked down owing to the sudden stoppage of the car. The motorist has quite enough to do in looking ahead without being worried with regard to what is in the rear. Some obstruction on the road may necessitate his prompt stop, and as the motor-car can be stopped in a very short space the cyclist who is following stands a very good chance of "coming a cropper." The warning should be widely given as to the danger cyclists run by persisting in such close attention to automobiles, and it is to be hoped they will not disregard the advice.

"Motor-Car Accidents."

LEADING newspapers have, unwittingly in most cases, done much to deepen the prejudice of some of the public against motor-vehicles by describing every collision or mishap as a "motor-car accident." If a brewer's dray runs into an automobile the incident is reported as a "motor-car collision," the inference

being that the mechanically-drawn vehicle was the offender. Often have we drawn attention to this want of accuracy in the Press in general terms as calculated to inspire feelings of distrust. It is to be hoped that motorists will call the attention of editors to such lapses whenever and wherever they occur, and thus render a service to the industry generally.

A Case in Point.

ELSEWHERE we report an accident to a motorist, which was duly recorded in the *Birmingham Daily Gazette* as a "motor-car accident." True it may have been, but those who read the report will see that the motor-car was quite innocent in the matter, and the heading we have given the paragraph is, we suggest, far more applicable. The car was going at only a moderate pace, and it was in the effort to avoid a cyclist and tramcar that the motorist was crushed between his own vehicle and another cart. Such an accident would have occurred had the car been drawn by horses, and to imagine that it was in any way connected with the propelling power employed is absurd. And yet such mishaps—regrettable as they are—are generally regarded by the public as inevitable consequences of motor-car behaviour.

such a decision the members of the vestry were largely influenced by the experience of the Strand District Board of Works, whose vehicle has a capacity double that of an ordinary cart, while the increased speed also tends to accelerate business. We understand that the Strand Board of Works has recently ordered a second motor-van, and that the surveyor to that public body estimates a saving of £200 a year with each, as compared with a corresponding amount of work done by horse-drawn vehicles. During the course of the discussion at St. George's Vestry, Colonel Legge said that smokeless coal or coke would have to be used for fuel, and the vehicle was capable of carrying enough fuel for forty or fifty miles. One important consideration in connection with motor-vehicles for such work is that they can be turned in a small area.

A Group of Panhard Cars.

WE are this week enabled to publish a photo of an interesting group of Panhard cars, all of 6 h.p., the drivers of which will be well known to many of our readers, they being all members of the Automobile Club. On the left we have Mr. Frank H. Butler, the popular honorary treasurer of the Club, on the car which he recently brought over from Paris; in the centre we see Mr. and Mrs. T. B. Browne; while at the right is Mr. H.

MESSRS. FRANK H. BUTLER, T. B. BROWNE, AND H. LOEFFLER ON THEIR 6-H.P. PANHARD CARS.

Photo by]

[Argent Archer, Kensington.

The Queen in Ireland.

ON the occasion of the review of 50,000 Irish youngsters by the Queen in Phoenix Park, Dublin, on Saturday last, several motor-vehicles were about the city, and many of the children from the distant towns probably saw such cars for the first time. After the Queen, at some little distance, was Mr. J. McDonald, the local manager of the Cycle and Motor Company, Limited, and he, mounted with his little daughter on an Ariel motor quadricycle, followed Her Majesty through the Park, Blanchardstown, Clonsilla, and back through the Park to the Viceregal Lodge. Prior to the Queen's drive Mr. McDonald had an opportunity of explaining to the Lord Lieutenant of Ireland and his two sons the principle of his machine, and giving them particulars of its power and speed, as well as some idea of its comfort and serviceability.

Motor-Vans for Municipal Work.

AUTOMOBILES continue to demonstrate their serviceability in connection with municipal work, and London vestries continue to show enterprise in their adoption. The St. George's (Hanover Square) Vestry has decided to purchase a Thornycroft motor tip-wagon, with water tank, at a cost of £750. In coming to

Loeffler, who left London on his car on the 3rd inst., on a journey to Berlin. We may add that both Mr. Butler's and Mr. Browne's cars will take part in the forthcoming 1,000-mile Trial.

The Exhibition.

TO-MORROW, Saturday, the 14th, the great Motor-Car Exhibition, under the patronage of the Automobile Club and managed by the proprietors of this Journal, will open, and during the whole of next week automobilists will meet at the Agricultural Hall to compare notes and see the latest developments of the new industry. We have previously set forth the leading features in detail, and there is now no need to repeat them, as the catalogue of the exhibition will give visitors a comprehensive view of the leading events of the week.

The Catalogue.

A FULL and complete catalogue has been prepared, copies of which will be on sale in the exhibition, price sixpence each. As there will doubtless be some who cannot attend the exhibition, we shall be pleased to send copies post free to such absentees, or to readers abroad, on receipt of ninepence. Early application for copies is, however, requested, as there is likely to be a great demand at the exhibition.

THE AUTOMOBILE MEETING AT SALON.

(From Our Own Correspondent.)

AFTER the hill-climbing contest up the famous Côte de l'Estérel at Cannes had been decided on the 1st inst., a general move was made by automobilists to Salon, where two important events were set down for decision. The first of these, that decided upon Tuesday, the 3rd inst., was a "course" open to all voitures and motor-cycles. The distance was 100 kilomètres, or 75 miles, and the route followed was an ideal one for a race. Seventy-five kilomètres of the course were contested over that wonderful stretch of road lying between Salon and Arles, a road running straight as a die, and without a serious grade from end to end. The Automobile Club of Salon had taken measures to secure this route, it being in a thorough state of repair, and seldom, if ever, has an automobile race been contested under more favourable circumstances. To complete the required hundred kilomètres the organiser had added a loop to this straight run, and here too the road surface was excellent. Small wonder then that on a route so perfect and favoured with glorious weather the times made were altogether exceptional. Béconnais set the example, and what an example, too! One hundred kilomètres in 82min.! An average speed of 73 kilomètres, 150 mètres, or 45½ miles per hour, over a distance of 100 kilomètres is not bad travelling even for the "king of motor cyclists." The actual time for the distance was 1h. 22min. 34½sec., which demolishes Rigal's record made on the Etampes-Chartres road on March 22nd last by 8min. 14½sec. Marcellin, too, achieved magnificent times until leaving Arles, when he came to grief through a broken tube, and let up Gasté into second place. The latter continued to travel well, and by finishing less than seven minutes after the leader, he also beat Rigal's record. The other competitors did nothing worthy of note. Turning to the voitures, an exceptional performance by Théry, driving a Decauville car, has to be recorded. He made the distance in 1h. 47min. 47½sec., beating the ancient record of Léon Bollée by 9min., and giving the excellent average of 56½ kilomètres (35¼ miles) per hour. Jules Dubois, who finished second, also drove a Decauville, but a punctured tyre and the consequent delay made his performance but a slow one as compared to that of Théry.

In marked contrast to the weather of Tuesday the morning of the following day, the 4th instant, broke under miserable conditions, and it was seen at a glance that "La Coupe Provinciale" would be contested for under trying circumstances, and not only was the weather stormy, but the equanimity of certain representatives of the competing clubs was also sadly ruffled. M. Chauchard, representing the Automobile Club of Nice, took exception to the representation of M. Cuchelet for Salon, on the ground that he was a Marseilles man. His objection, although apparently well founded, was not upheld by the committee of organisation, and until the very last moment M. Chauchard expressed his intention not to participate in the race. Perhaps it was a little unfortunate that the objection should have been lodged by him, as it appears that he himself had borrowed M. Pinson's well-known 12-h.p. Panhard in order to strengthen Nice's chance of obtaining the trophy. As is generally known, the "Coupe Provinciale" is the result of a meeting of delegates from the various automobile clubs of the south-east of France, held on February 2nd last, at which it was decided to hold a yearly competition among the clubs of that region. Two trophies were procured, one for cars and one for motor-cycles, and it was to decide the first holders of these trophies that the race of the 4th instant was held. The route selected was one of 180 kilomètres (112½ miles), from Salon, by way of la Fare, Aix, Saint-Cannat, Lambesc, Sénas, Orgon, Saint-Andéol, Avignon, Rognonas, Tarascon, and Arles, back to Salon. At a few minutes past 10 a.m. the first of the eight competing cars set out on the journey, the last of them to leave being that of Cuchelet. The competitors were:—Becq (Béziers), Chauchard (Nice), Vaglians and de Fabrègues

(Marseilles), Pansu, Audibert and Eparvier (Lyons), and Cuchelet (Salon). Immediately after they had got clear away, the motor-cyclists—Donjeon and Gibelin (Avignon), Menard (Lyons), Audibert and Cavasse (Salon), started. At Sénas Chauchard held a 13min. lead of Cuchelet and Becq, but this advantage he did not maintain, for Cuchelet finished but 2min. 52sec. after him at Salon, and as the latter had started 3min. later from the "Contrôle de Départ," his time was the fastest by 8sec. The others to finish were MM. Audibert and Fabrègues, both a couple of hours after the leaders. M. Lambex broke a wheel at Lambesc, M. Becq had an accident at a level crossing, and MM. Pansu and Eparvier gave up. The only motor cyclist to finish was Cavasse of Salon, and he took seven hours and a-half to make the journey. Oh! those short circuits! Both cups would, therefore, appear to have been secured by Salon, but subsequently the president of the Federation telegraphed to M. Gondoin, the president of the Nice Club, to the effect that M. Cuchelet was disqualified, and that M. Chauchard would, therefore, be regarded as the winner of the race, and the Nice Club as the holder of the trophy. The racing was witnessed by many well-known automobilists, including MM. René de Knyff, Étienne Giraud, Pinson, Gondoin, Tart, Gleizes, and Darracq, and the Parisian contingent will have many pleasant souvenirs of their visit to Salon.

THE FASCINATION OF MOTORING.

VOLUMES have been written in praise of riding on horseback, and newspaper columns have overflowed with laudation of bicycling. Ballooning, running, and every form of sport have their votaries, ever willing to descant upon the fascination of their favourite hobby. Naturally each class of sportsman exalts his own pastime above the others.

But who has found a motorist willing to yield to any other sport the charm and delight possessed by motoring? The pursuit of automobilism seems a consuming passion hastening its novitiates into ecstasies of pleasure as they become more and more proficient. People point to the intelligence of the horse as something wholly wanting with the motor-car. It may be that the automobile does not possess that almost human quality of temper which gives such a zest to a ride on a spirited horse; but it also has its moods and its little tricks, which have to be studied and mastered. In the motor-vehicle there is something more than a means of pleasure; there is infinite opportunity for the concentration of ideas and the ever-watchfulness which is associated with riding.

Then, too, the motor never tires, and does not flag. Undue heat will not give the sense of depression which animals feel while the delight of coasting up hill and down again, rushing by country farms, churches, hamlets, and grazing cattle without needing to urge the steed forward with whip, lash, and shouts of encouragement, and concluding long rides with refreshing and invigorating feelings is a sensation only possible to automobilists.

Ordinary driving is enervating if long pursued, but the motorist can spend hours on his car travelling considerably faster than any horse could journey, and reach the end of the trip with a sense of new life and rejuvenation which is only describable by one word, fascinating. Motoring is an added opportunity for enjoyment, a new means of excitement, the climax of driving, cycling, and all other sports on land which the ingenuity of man has devised and the force of nature has provided. Such, at least, is the view of all loyal and enthusiastic motorists—and we cannot imagine a motorist to whom these two adjectives cannot, in truth, be applied.

THE Wolsley Sheep Shearing Company, Limited, of Birmingham, have entered another of their voitures for participation in the 1,000-mile Trial. The company will now have two vehicles in the contest.

THE Columbia Motor and Manufacturing Company, Washington, D.C., has purchased the plant of the Crouch Automobile Manufacturing and Transportation Company, of Baltimore, Md., and will move its plant to Baltimore.

The Audibert-Lavirotte Four-Seated Car.

LA SOCIÉTÉ des Établissements Audibert et Lavirotte, Rue des Quatre-Maisons (Monplaisir), Lyons, France, have lately taken up the construction of high powered cars, fitted with motors of either $7\frac{1}{2}$, 12, or 16 h.p. The accompanying illustration shows a four-seated car lately turned out by this firm. The frame, which is of tubular construction, carries the whole of the motor and transmission gear, so that any style of body can be fitted to meet the desire of purchasers. In the car illustrated the engine is of $7\frac{1}{2}$ h.p.; it is of the horizontal two-cylinder type with electric or tube ignition, and water jacket, its location being at the rear of the frame. The crank works in an oil-containing case. The valves are so arranged that they can, by the removal of two bolts, be readily withdrawn for cleaning, etc. The normal speed of the motor is 650 revolutions, but this can be increased by means of the accelerator provided. Coming now to the transmission mechanism, four forward speeds and a reverse motion are available; the motor shaft is connected through a pedal-operated friction clutch to a short shaft carrying a number of pinions of different size, any one of which can be made to mesh with corresponding gear wheels on the differential shaft, the power from the latter being transmitted to the rear road wheels by the usual sprocket wheels and chains. Like the crank, the variable gear works in an oil bath. As the illustration shows, steering is controlled by an inclined hand-wheel; it will be seen that there are two wheels on the steering pillar, one above the other; it is the upper one by which the steering of the car is effected, the lower one controlling the variable-speed gear. The frame is suspended by easy springs on artillery wheels, shod with pneumatic tires. Ample brake power is provided, while to reduce the necessity of frequently changing the cylinder cooling water a radiating coil is fitted in the front part of the car.

MR. E. J. COLES will repeat the performances recently given by him at the Alhambra every afternoon and evening at the Automobile Club's Exhibition at the Agricultural Hall next week.

THE Panhard Levassor Motor Company, Limited, has been registered, with a capital of £100, to carry on the business of cycle, vehicle, flying machine, launch, and motor manufacturers, electrical and general engineers, etc.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Some New Jenatzy Vehicles.

M. JENATZY, whose "Jamais Contente" electric racing car attracted so much attention in Paris last year, is now carrying out some trial runs with a new car, which can, it is stated, attain a speed of 50 kilomètres per hour, and cover a distance of 97 miles on one charge of the batteries. M. Jenatzy's company is also reported to be at present engaged on the construction of a combination electric and petrol car.

A New Commission.

WITH a view to the amendment of the existing laws regulating the use of automobiles in France, and for the purpose of supplementing them to the extent which the enormously increased number of motor-vehicles renders necessary, Monsieur Pierre Baudin, the Minister of Public Works, has appointed a special commission. In issuing his decree, M. Baudin states that he makes the appointment of this commission because he finds that the application of the law of March 10th, 1899, presents certain disadvantages which he desires to see remedied. He also directs the attention of the members of the commission to the three questions which have of late been so frequently discussed, and the satisfactory solution of which would be so eminently desirable. The first of these is the question of "sonorous signals," as the trumpets are styled in M. Baudin's circular. Are they, or are they not, to be suppressed? Some authorities on the circulation of automobiles advocate their entire suppression, contending that under ordinary circumstances the noise of the motor itself is sufficient to give warning, and that when necessary this can be supplemented by the voice of the driver. This doubtless would be effective enough on quiet country roads, but in towns the hum of the engine passes unnoticed among the noise of the traffic, and the *chauffeur* may shout himself hoarse without attaining his object. As for turning a corner, what a tribulation that would be, and what a strain upon the vocal organs of the motor-man.

Granted that the indiscriminate use of the trumpet is objectionable, nay, more, positively dangerous, for it terrorises the horse in a manner that the motor itself seldom does, still it seems to me that its retention is essential until some equally effective and more agreeable signal shall have been found. The second matter to which M. Baudin draws attention is that relative to the passage of automobiles through towns and villages. There is one very effective method of preventing fast driving through villages, and that is the employment of "pavé" on the route. Except when racing, no automobilist drives fast over "pavé," and the village which rejoices in this commodity need have no fear of cars traversing their streets at anything but a crawl, that is, always provided that the "pavé" is not too good. M. Baudin's third point is the much discussed question concerning distinctive marks for motor-vehicles. While the whole automobile world is against the disfigurement of their cars by the employment of numbers, no serious objection would be raised to the naming of every vehicle. Let the name be painted distinctly and legibly upon each car, and the public and the police will have little trouble in identifying any wrongdoer, although not so easily, perhaps, as would be the case were numbers employed. I am sure that the naming of cars and the intelligent vigilance of the police will safeguard the interests of the public perfectly efficiently without resorting to any such objectionable plan as the numbering of automobiles. M. Baudin has, in appointing his commission, shown sound good sense; for, as will be seen from the following names, the members are all thoroughly acquainted with practical automobilism, and their recommendations are sure to be as moderate as they will be effective. The members are:—MM. Jozon, Forestier, Mourier, Michel Levy, Collomp, De Zuylen, Ballif, Krebs, Pierre Giffard, Rodolphe Darzens, and Walckenaer. It may be noted that eight of these gentlemen are members of the French Automobile Club.

For the Novices.

SUNDAY, April 29th, is the date that has been definitely decided upon for the automobile race known as "La Course du Premier Pas," and which is only open to those *chauffeurs* who have never yet figured as competitors in a race. It is highly probable that a very great number of amateur drivers will avail themselves of this opportunity to indulge in a little excitement, and in order to give all a chance of glory the race promoters have established no less than five categories. These are:—(A) Motor-cycles of one seat; (B) quadricycles of one seat and motor-cycles with trailing car; (C) four-wheeled voituresses, with two seats side by side, weighing less than 250 kilogrammes; (D) Four-wheeled voituresses, with two seats side by side, weighing from 250 to 400 kilogrammes; (E) cars of at least two seats, exceeding 400 kilogrammes in weight. The *Vie au Grand Air* is promoting this event, and has selected as the scene of the contest the Paris-Rouen route. The double journey will be made, that is, a distance of about 135 miles, and among the entries received to date are the Marquis de Lurey, D. Laillault, L. Laillault, Stéphi, Gouchaux, and Klotz.

The Filtz Motor-Tricycle.

A NEW motor-tricycle known as the "Filtz" has lately been put on the market by Les Ateliers de Construction Mécaniques (Turgan and Foy), of Boulevard de Carnot, Levallois-Perret, France. Fig. 1 gives a general view of the machine from the rear. The principal feature lies in the motor (Fig. 2), to the cooling of which, as will be seen, special attention has been devoted. The inlet and exhaust valves are arranged at each side, quite independent of the cylinder; they can be readily taken out, the operation only necessitating the removal of one nut for each valve. The exhaust valve cam works inside a kind of frame to the upper end of which is connected the valve-rod, the lower end forming a guide sliding on the motor shaft. By this means the valve-rod is guided in its course, and cannot, it is claimed, "stick," it being drawn back as well by the springs as by the cam itself. It will be noticed, too, that the

springs are placed well away from the parts where they are likely to be detrimentally affected by the heat.

FIG. 1.—REAR VIEW OF FILTZ MOTOR-TRICYCLE.

FIG. 2.—GENERAL VIEW OF FILTZ MOTOR.

German Contests.

THE project put forward some time ago of organising a competition for electric vehicles in Berlin has taken definite shape, and Tuesday next, the 17th inst., will witness the first of a series of tests to which the competing cars will be subjected daily up to and inclusive of Monday, the 23rd inst.

Mr. Martin Kallmann, the well-known scientist and electrician, and who, by-the-by, is a very prominent member of the Automobile Club of Central Europe, is organising the competition, which will be on fairly severe lines. After the not very creditable performances made by the majority of competing vehicles in the test which took place after last year's automobile exhibition in Berlin, there exists a certain doubt as to the practicability of electromobiles, and it is largely to ascertain their real capacities that the present competition is being promoted. If, as it is hoped, the cars acquit themselves well, electric traction in the German capital will receive a much-needed fillip. Another event which is set down for decision at an early date is a race from Mannheim to Pforzheim and back, a distance of 103 miles. Promoted by the Rhenish Automobile Club, this *course* will be run off on Sunday, May 13th, and the competitors will be divided into four classes, viz., racing-cars, touring-cars, voiturettes, and cycles. It is anticipated that the race will secure many entries and will be hotly contested.

The Paris-Roubaix Race.

It is on Sunday next that one of the oldest and best known of the annual automobile events will be decided under the management of *Le Vélo*, and as nearly all the crack motor-cyclists have inscribed their names, the contest for the premier place will be a severe one. This fixture is the Paris-Roubaix *course*, which, originally a cycle race pure and simple, became in 1898 an automobile event by the creation of a section for motor-cyclists. The race is an extremely popular one with competitors and spectators alike; indeed, many of the latter go as far afield as Breteuil, some 105 kilomètres from Paris, in order to witness the passage of the racers. The start will be effected from Chatou at 10.30 a.m., and, given fine weather and good roads, it is anticipated that the leaders will arrive at Roubaix at about half-past three in the afternoon. The route is by way of Saint Germain, Conflans, Pontoise, Beauvais, Breteuil, Amiens, Doullens, Arras, Seclin, and Lesquin, a total distance of 268 kilomètres, or about 168 miles. Among the entries I note the names of Meyer, Béconnais, Rigal, Marcellin, Osmont, Baras, Tart, Willaume, Rivierre, Léa Lemoine, Vasseur, Dernester, and Bardin.

MESSRS. TH. BOTIAUX AND CO. is the style of a new firm which has just been formed in Paris (21, Avenue St. Ouen), with a capital of £3,200, to build motor-cars.

THE Anglo-American Oil Company, Limited, has issued a very useful card giving the names and addresses of over fifty agents holding a stock of Pratt's motor-car spirit on the route of the 1,000-mile Trial.

MR. HERBERT J. CROFT, of Kendal, informs us that, besides being agent for Carless, Capel and Leonard's petrol, he can charge accumulators for motor-cars, so that anyone taking part in the 1,000-mile Trial can rely upon having both petrol and their accumulators charged in Kendal.

THE annual general meeting of the shareholders of La Société des Anciens Etablissements Panhard and Levassor will be held on Tuesday, May 15th, at the offices of the company, 19, Avenue d'Ivry, Paris. An extraordinary general meeting will follow the termination of the ordinary business as it is required to affect certain alterations in the company's statutes.

THE Autocar Company, of Ardmore, Pa., have just completed a new petrol carriage. It weighs 635lbs., with water and petrol for a seventy-five-mile run, and seats two persons comfortably. The motor, of the Otto cycle type, has two cylinders, with cranks set at 180 degs., and develops $4\frac{1}{2}$ h.p. Power is transmitted to the rear axle by means of a counter-shaft consisting of a speed drum, to which band brakes are applied, so that any speed, including a hill-climbing speed, may be obtained. The vehicle is entirely automatic, both as to fuel supply and lubrication, and is controlled by a single lever. The frame is composed of steel tubes, with brazed joints. The front axle is flexible to compensate for the inequalities of the road. A condenser cooling the water from the cylinder is placed under the footboard.

THE DELAHAYE MOTOR-VOITURETTE.

CALLING at the Automobile Palace (Messrs. Friswell) on Holborn Viaduct, E.C., the other day we were shown a new two-seated car built by Messrs. Em. Delahaye and Co., of Paris, of which a general view is given herewith. The engine, which is of the horizontal single-cylinder type, is of $4\frac{1}{2}$ h.p.; it is located centrally at the rear of the frame, and is fitted with electric ignition and water jacket, the water circulation being maintained without the use of a pump. Two speeds forward and one reverse are available, the power of the motor being transmitted by a single belt working on fast and loose pulleys to a counter-shaft, and from the latter to the rear axle by the usual sprocket wheels and chains. Wheel steering is

provided, while the variable speed gear is controlled by a single handle. As regards braking power, a foot pedal actuates a hand brake on the counter-shaft, while there are also band brakes, worked by a hand lever, on drums on the rear axle. The water tank is located in the front of the car, while that for the petrol is under the seat. The road wheels are of wood, shod with pneumatic or solid rubber tires as desired. Finished in natural wood the car has an attractive appearance; on the level it can, it is claimed, attain a speed of from eighteen to twenty miles per hour.

A MOTOR-OMNIBUS service is about to be started between Montbrison and Sainte Anthème, France. The vehicles have accommodation for twenty passengers, and can attain an average speed of 20 kilomètres per hour.

THE Waltham Manufacturing Company, Waltham, Mass., have secured the exclusive agency in America for the Aster motor, and in future they will fit their tricycles and quadricycles with either the De Dion or Aster motors.

LA SOCIÉTÉ DE VOITURETTES AUTOMOBILES, of 163, Avenue Victor Hugo, Paris, have gone into voluntary liquidation, and the affairs of the company are now being wound up. The society was manufacturing motor-vehicles under the Léon Bollée and E. Durand patents.

FROM the office of the Conty Guides (12, Rue Auber, Paris) we have received a copy of a new pocket guide to Belgium. The book, which is of a very handy size, opens with a brief history of the country, followed by a number of pages of general information. The guide is based on a fifteen-days' tour in Belgium, starting at Brussels, and including visits to all the leading places of interest. Illustrations are given of the principal buildings, while a useful feature is the provision of maps of the leading cities and towns, including Brussels, Antwerp, Ghent, Bruges, etc.

THE AUTOMOBILE OUTLOOK.

INTERVIEW WITH THE HON. C. S. ROLLS.

THE Hon. C. S. Rolls has come rapidly to the front—on a motor-car. Always interested in mechanical science he devoted much of his time to practical experiments, when at Cambridge, where he took his degree in engineering. When a boy at Eton he fitted up, alone, one of the first complete electric light installations in Monmouthshire, the switchboard, etc., being from his own design. He has also travelled much in Russia, Turkey,

Greece, and North Africa while three months at sea, where he qualified as third engineer, gave him considerable acquaintance with the Baltic. Thoroughness is a characteristic of his nature, and he has studied gas, steam, and oil engines until their mysteries have become clear. Before racing on a modern motor-car he acquired skill in connection with traction engines and locomotives and also won distinction as one of the University cycling team, gaining his half blue and being captain of the University cycling clubs. In his cosy room at South Lodge, Knightsbridge, where I recently spent a couple of hours with Mr. Rolls (writes a representative of the *Motor-Car Journal*), are many trophies of the days when he pedalled and also of the more recent events associated with motoring. In response to my wish to see the latter I was shown a blue paper neatly framed and hung in a conspicuous place among a great collection of old friends, familiar cars and capital photographs taken by my host.

"This was my first distinction as a motorist," said Mr. Rolls, "and I regard it as interesting, for it was a summons issued before Parliament removed the restrictions which had hampered the development of automobilism. In those days I had some sharp runs, mostly at night and was fortunate enough to secure the consent of the authorities in Hertfordshire and Cambridgeshire to my driving without the red flag in front. Great was the astonishment of the natives of the villages passed through, and on one occasion when I was going from London to Cambridge the good people of Royston (which is thirteen miles this side of the University town) sat up all night to see the horseless rider go through their little town. Their vigil was, however, unrequited, for I did not arrive until the next day."

"Curiosity has been materially satisfied since then?" I suggested.

"Yes, but in some distant places we motorists are still objects of interest, and it is remarkable how a motor-car when standing quietly outside a shop is generally regarded as having broken down. Many people have not yet comprehended the fact that the driver of a motor-vehicle must leave his car just as the driver of an ordinary horse and carriage. Whenever they see a motor-car by itself a crowd quickly gathers, and the majority of the observers express surprise to see it glide steadily on under the control of the driver. It is very different in France."

As is well known, motoring is accepted as a matter of course on the other side of the Straits of Dover, and Mr. Rolls has decided views as to the reason for that view of things.

"Racing made the industry in France," he said, "and one of the most hopeful signs at the present time is that English makers are turning their attention to the subject. The result should be seen in a higher class of car, for the maker who can produce a vehicle to stand the strain of a great race is best able to build one for ordinary touring or pleasure. Great care has to be taken in the construction of racing cars, and the introduction of aluminium will show makers where the weight of ordinary cars can be safely reduced."

"But you would not advocate the introduction of automobile racing in this country at the present juncture?"

"Certainly not; although now it has been commenced in France it would be exceedingly difficult to put a stop to it. It receives encouragement from the Press and help from the local authorities of the places through which the vehicles pass, for they

realise the substantial benefit conferred on the district—especially those towns where the competition begins and ends. That will probably be demonstrated here during the forthcoming tour of the Automobile Club, and although the stopping places are large towns where the advantages will be spread over a wide area they will be tangible and unmistakable. But the absence of English races should not deter English makers from the construction of racing cars, for there will be classes reserved for Englishmen, and perhaps, after a while, English cars, in some of the leading Continental races. In France the firm that does not construct racing cars which have won good positions is in a very poor position and held in light esteem by enthusiastic *chauffeurs*—even by those who only require cars for ordinary use."

Asked as to his own experience of French racing-cars, Mr. Rolls, who, needless to say, is not interested in any maker, unhesitatingly placed the Panhard firm's productions first, he having done well with their 8-h.p. car against competitors using 12 or 16-h.p. cars. He recently brought a 12-h.p. Panhard car from Paris to participate in the Automobile Club's trials, and later in the year hopes to take part in some of the French races on a Mors car of greater power—the exact power, however, being tantalisingly kept a secret which not even the most insidious methods of the interviewer could obtain. Whether it will be equal to trying conclusions with De Knyff's new car is another matter—for, if report be true, that will be an exceptional vehicle. Still, the machine is not everything in motor-racing, as some think.

"Mechanical instinct and patience are two important factors," said Mr. Rolls, "and care must be taken with all adjustments so that the motor shall give its greatest power at the critical time. All the great French racing men spend hours with their car before the start, and I have found, in practical experience, that after the car is apparently ready to start one can spend three days on nothing else but making trivial adjustments. The man who takes the greatest amount of trouble, spends the longest time over his car, and makes the greatest number of trial runs is most likely to win the race."

From the general subject we got to the men who take part in the French races.

"They are all, so far as I have observed, thorough sportsmen. In fact, many of the leading motorists of France are owners of the best stables—Baron de Zuylen, for instance. They have only taken to motoring because of the sport it affords, and although the motor-car has sometimes been considered *infra dig.* by English sportsmen that prejudice is likely to pass away. It can only be felt by those who have never enjoyed the excitement of a contest, for, in my view, there is no more fascinating form of sport. This, too, is borne out by the number of horsemen who are taking to motor-vehicles and such lovers of horses like the Earl of Carnarvon and my father—Lord Llangattock—are developing into sportive motorists."

"Apart from the sport of motoring, Mr. Rolls, what is the outlook for the motor-vehicle as a means of transport?"

"Highly encouraging to British industry. The advantages are undoubted; and I have seen the plans of a light engine that could draw a load which requires mules or oxen extending to a length twenty times its own. Such economy in space would be of advantage in war as well as in the crowded streets of our towns. The French have regarded the automobile from the sporting point of view, but our makers have regarded it mainly as a commercial vehicle, with the result that our heavy vehicles are already superior to those of Continental construction."

Seeing that the automobile movement is likely to become an important fact in our national industry I naturally invited Mr. Rolls as to his suggestions to British manufacturers desirous of making up the leeway between French makers and themselves.

"As to the commercial outlook the field is enormous, and I do not know of any other industry which sprang up in France with the same rapidity. The first automobile race in France was in 1894, the course being from Paris to Rouen. The public took an immediate interest in the sport. The continuance of racing has maintained that interest and been a great factor in improving the efficiency of motor-vehicles. Those who have specially applied themselves to the production of cars sufficiently light, strong, and serviceable for racing have reaped their reward. It is now

practically the rule in France to consider that if you can get a car without paying a premium in less than, say, six to nine months the car is not much good. In fact, it absolutely holds good throughout the industry that the longer the time before delivery the more likely is the car to be a good one, and the Panhard Co. cannot promise delivery in less than eighteen months or two years.

So roseate is the position in France that I asked Mr. Rolls if that was also true of other countries of the Continent.

"Well," he replied, "I should not like to particularise save to say that in some other countries wonderfully cheap cars are made, the main claim being their simplicity. But so-called simplicity does not always ensure the highest success in operation. The old grandfather's clocks were simple compared with the delicate mechanism of modern watches—but who would prefer the former to the complicated parts of the latter? Each part has actually some work to do, and intending motorists should remember that less working parts will probably mean a less efficient car while in racing it by no means follows that the simplest car will have any chance. Unfortunately the shop-window view of things is frequently taken by intending owners of motor-cars who look to the painting of the body and of the wheels rather than to the degree of strength or mechanical proportions."

In many circles the continued importation of French cars is occasioning some concern in view of the efforts of English makers to secure the market in their own country. Mr. Rolls regards this as an advantage in the present stage of the industry.

"Nothing," he emphatically affirmed, "can assist English constructors more than the importation of French cars. When our British firms are able to build cars as good as the Panhard, for instance, it will then be time for them to begin and work out ideas of their own. Till then experiments will be only a waste of time and of money. We have first to realise that other countries are very much ahead of us."

"That is not the fault of our engineers," I observed, glancing at some old prints of Gurney's, Church's, and other men's vehicles, which were running on English roads before the Frenchman ever thought of travelling other than by animals. There amidst his photographs of modern cars—Peugeot's, Panhard's, etc.—Mr. Rolls has some interesting old prints of vehicles which, had not a short-sighted Parliament prevented development, would have attained high perfection by now.

"Certainly," I agree, "and but for the opposition of interested factions sixty years ago we should have led the way in automobilism now. But that opposition succeeded, and other nations have had years of experience. Let our people utilise that instead of learning it for themselves. If our makers had been wise they would, three years ago, have bought modern French cars and copied them exactly instead of spending money and time in unnecessary experiments. Having succeeded, that would have been the time to strike out along improved lines. I believe that those who have imported French cars would quickly change their custom to English firms as soon as they produced equally good vehicles. That English *chauffeurs* are anxious to race with English cars has been proved by the Hon. J. Scott Montagu, who took the first English built car into a Continental race."

The views of such a practical motorist on other cars are always interesting, and I questioned Mr. Rolls as to some of the American cars with which he is acquainted. The Whitney naturally occurred first.

"I thoroughly enjoyed a ride on a Whitney car when it was in England last year. It was a lovely thing while it lasted, but great care had to be taken to keep the right amount of water in the boiler. Unfortunately the visible exhaust has not been got over—but, even with these two failings, it is about the best steam car I know. But the very best American car is in my opinion the Duryea petrol car, which I drove for a short time some years ago. It had an extremely silent motor and gear, and the speeds of the car were entirely controlled by one lever. I have often wondered why more has not been heard of it in this country."

While holding to the view that at the present time the petrol car is undoubtedly the most satisfactory, Mr. Rolls does not despair of seeing electrical vehicles—of which he regards the Columbia as the best—about the streets.

"They are perfectly noiseless and clean. There is no smell or

vibration, and they should become very useful for town use when fixed charging stations can be arranged. But for country use I do not anticipate they will be very serviceable—at least for many years to come."

"But," I reminded Mr. Rolls, "even country users of petrol propelled cars have their difficulties. Not perhaps from the nature of their cars, but the density of railway officials in connection with the new motor-car spirit regulations."

"Well, they must act with the supplying firms in a united body to resist the recent innovation. And if the railway companies are not prepared to meet us in the matter one or two of the larger firms supplying motor-car spirit must organise motor-car services to deliver their petrol in country districts. Not only would such do something to popularise automobiles, but it would also show the railway companies the value of motor-cars. In France, many of the companies also own motor-vehicles and in many cases they would prove useful adjuncts in this country."

As a winter pastime motoring has been fully justified during the last few months as the *Motor-Car Journal* has amply shown, and Mr. Rolls is quite enthusiastic on this point.

"The trip I took from Paris to Havre last December was largely over the snow and frequently in the hilly districts of my home in Wales I have seen horses struggling to get a foothold on frozen roads while my car went by with ease and grace. Although we have been inclined to regard the motor-car as a fair-weather vehicle I am not sure whether its greatest service will not be in

THE HON. C. S. ROLLS ON HIS NEW 12-H.P. PANHARD CAR.
[Photo by] (F. Howard Mercer, F.R.P.S.)

the winter—so far as easing the hardships of horses are concerned, for it is certain that the motor-car can negotiate steep places which are almost inaccessible to horse-drawn vehicles in frosty and severe weather. My only real difficulty in frosty weather was when in Paris the circulating water froze during 20 degrees of frost and the radiator burst. Three hours spent on my back under the car, however, and three hours thawing with burning petrol, enabled me to put that right and resume the journey."

Before leaving South Lodge I was shown the workshop in which Mr. Rolls has often been engaged throughout the night pursuing his hobby and tending his car after a long run, or preparing it for some great feat on the morrow. It is a very business-like apartment, roomy and lofty, and fitted with a variety of tools and appliances, and a pit, while there is kept a duplication of motor-car parts which keep the owner free from some of the little worries associated with the pleasure of motor-car possession. On the walls are ranged the numbers worn by Mr. Rolls in his various competitions, and these are already making a good total. The longest non-stop run he has done in this country was one of 146 miles on the North Road on the occasion of the *Motor-Car Journal's* trials in connection with the Agricultural Hall exhibition last year, when he obtained a gold medal. Other awards obtained in competition include those for the best

motor-vehicle (an 8-h.p. Panhard) at the Dover meeting of the British Association; two first prizes at the Yorkshire show at Bradford a few weeks ago, and a silver medal in the hill-climbing competition at the same place, when Mr. Rolls performed his task in half the time occupied by anyone else. These and successes won in French races made a record in the new sport which well entitles the recipient to a first place among British automobilists and give enhanced value to his optimistic view of the future popularity of the motor-car as a form of sport and of the prosperity of the industry. Between the purely sporting and the solidly commercial aspects there is another which Mr. Rolls regards as equally important—viz., the social influence of the motor-car in enabling country gentry whose visiting is now restricted by the want of railway facilities, or the capacity of their horses, to get across country and do far greater distances without inconvenience, thereby increasing their circle of friends, while its adoption by shooting parties has already commenced. In fact, he told me, as I bade good-day, the "motor-car will probably become universal—at least, every country house will ultimately possess its motor-car, which will be regarded as as indispensable as the present-day horse and pair."

MEYRA DRY BATTERIES FOR ELECTRICAL IGNITION.

THE Meyra Electric Company, of 75, Newman Street, London, W., are introducing electric sparking sets, consisting of four of their patent dry cells of special shape, conveniently arranged in a rectangular or square box or covering to suit the various requirements of motor-carriages and motor-cycles. The makers state that the suitability of sets of dry cells for petrol or gas ignition has been now proved beyond doubt. Most of the successful motor-cars and motor-cycles in the recent exhaustive trials in France were, we understand, supplied with these sparking sets. They are claimed to be more con-

venient, easily replaced, cleaner, less heavy and bulky, and more reliable than secondary accumulators.

The above illustration shows four dry cells of this special type in a convenient case for a motor-tricycle. The covers can be made of wood, leather, cardboard, india rubber, pegamoid, etc., to suit any requirements. These four cells of M.C. size, together in series giving six volts and ten ampères, weigh only about 12lbs., inclusive of case. The life of a sparking set of this type varies from 300 to 500 hours, according to the work required of it by the motor. An important feature claimed for this ignition set is its reliability in wet and stormy weather, and that no amount of heat or cold can effect its sparking.

LIEUTENANT I. N. LEWIS, secretary of the U.S. Board of Ordnance and Fortifications, Washington, has obtained patents on an oil motor for automobiles, of which much is expected.

THE business of Messrs. Cudell and Co., of Aix-la-Chapelle, Germany, is being converted into a company, with the title Die Gesellschaft für Motor und Motorfahrzeug-Bau, and with a capital of £75,000.

MOTOR-CARS IN AUSTRALIA.

(From a Correspondent.)

Melbourne, March 7th, 1900.

THE motor industry is now beginning to make fair progress in Victoria at least, a number of firms having become connected with the automobile. The most important of these is the Thomson Motor-Car Company, Flinders Lane, Melbourne, just formed to manufacture steam and other vehicles. This company has purchased the patents of the Thomson Steam Phaeton, and is said to have orders in hand to the extent of £10,000. The phaeton in question is of handsome design, will seat six comfortably, and weighs only 10 cwt. The motor is 5 h.p., having cylinders 1½ in. and 3 in. diameter and 3 in. stroke. The steam generator is of simple tubular design, and is only 1½ cubic feet, being 12 in. by 12 in. by 16 in., is worked up to 300 lb. to the square inch, and uses ordinary kerosene. Both the fuel and water supplies to the generator are under automatic control, and the phaeton has complete condensing apparatus, so that with a reserve of only 4 gallons the vehicle may be run about 25 miles; the consumption of oil is also very small, 1 gallon lasting the same distance. This vehicle has now run over 2,000 miles, and has been exhibited at the Melbourne, Bendigo, and Maryborough Agricultural Shows. It was recently exhibited at the Congress of the Society for the Advancement of Science, composed of all the leading scientific men of Australia, during which time it carried loads of eight and nine passengers.

Another successful Australian car is that lately completed by Mr. H. Sutton, who has devoted some years to his experiments. The rights of this car are under offer to the Thomson Motor-Car Company, and they should prove of considerable value, as the car is adapted to burning benzine, which is procurable here at about one-third the price of petrol, which costs up to 5s. 6d. per gallon. The oil motor on this car has a cylinder 3½ in. diameter by 4½ in. stroke, air cooled by radiators, with primary electric ignition, which may be advanced or retarded, and may be started from the seat. The vehicle is a doctor's phaeton to seat two persons, and has rear-wheel steering, the motor, which is mounted on the front axle, being connected to counter-shafting and then back to front-driving wheels by chain gear.

The Automobile Company has just landed a Benz car from Germany. The vehicle is not unpacked yet, but it should run successfully. We will then be able to compare the German "last edition" with an Australian "first edition," and some interesting trials should come off shortly.

There are quite a number of motor-cycles running about Melbourne, but the prohibitive price of petrol makes them rather an expensive luxury. The relative prices of fuel are:—Kerosene, 9d. gallon; benzine, 1s. 7d. gallon; petrol, 4s. 9d. to 5s. 6d. gallon; gasoline, 5s. gallon. Petrol is not stocked here, and what is required has to be imported privately. Our Government regulations prevent more than half a gallon being stored at once, placing a further disadvantage on the article.

The Dunlop pacing motors have done a great deal to assist the motor-car industry here, and they have proved to be highly satisfactory, a number of new cycle records having been established.

Both the postal authorities in Sydney and Melbourne are anxious to adopt motor-vehicles, but will not import at the present high prices ruling in England. The vehicles they want are to be made in the colonies, in order to ensure the carrying out of repairs promptly when necessary.

With reference to prices, it is expected that motor-cars will be placed on the market at English catalogue prices, so with a duty of 25 per cent., freight and charges, foreign competition should not be felt for years to come.

Great interest is being centred in a proposed run from Melbourne to Sydney (a distance of upwards of 600 miles) with an imported car yet to be landed. The Thomson Motor-Car Company, however, are pushing on with a light two-seated steam touring car, fitted with engines capable of running to 10 h.p. This car, it is expected, will do the journey in about 30 hours, but the roads are not particularly good.

CORRESPONDENCE.

STANDARD SIZES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter of a Cycle Agent in last week's issue deals with a practical matter for the manufacturer and factor. There is another matter I should like to ventilate through your columns, viz., the standardisation of wheels and spokes. Hardly any two builders of automobiles use the same sized wheels and spokes on their vehicles. Consequently, every order for the wheels and spokes is a special one requiring extra expense. Could not something be done to secure uniformity and thus lessen the cost?

Birmingham, April 10th, 1900.

Yours truly,
SPOKES.

MOTOR-CYCLE RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On behalf of the National Cyclists' Union and the Automobile Club of Great Britain and Ireland, we beg of you to permit us through your columns to call the attention of motor-cyclists to the rules which now govern motor-cycle racing, viz.:—(1) Motor-cycle races, in which muscular force may be employed for propulsion, are under the control of the National Cyclists' Union. (2) Motor-cycle races, in which muscular force may not be employed, except before the starting line, are under the control of the Automobile Club of Great Britain and Ireland.

1. As regards races held under the rules of the N.C.U., it is necessary that—(a) all riders, both amateurs and professionals, must hold licences from the Union. (b) Handicaps for motor-cycle races must be framed by an official handicapper of the Union. (c) The rules to be observed in motor-cycle races under N.C.U. rules are the same as apply to other cycle races.

2. In motor racing under the rules of the A.C.G.B.I.: (a) Competitors and their vehicles must both be registered with the A.C.G.B.I. (b) Tracks must be approved by the Competitions Committee; and meetings cannot be held under the rules unless a permit be obtained from the A.C.G.B.I.; (c) Handicaps must be framed by an official handicapper of the A.C.G.B.I., and there are other conditions contained in the rules, copies of which can be obtained from the Automobile Club of Great Britain and Ireland 4, Whitehall Court, London, S.W.

Our committees trust that they may receive the loyal support of motorists of all classes in their endeavours to encourage and protect legitimate motor racing in this country.

Yours truly,

April 7th, 1890. S. R. NOBLE, Secretary, N.C.U.
C. JOHNSON, Secretary, A.C.G.B.I.

A 400-MILE TRIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read some time ago in your journal that you were pleased to receive from your readers accounts of motor-car tours, and having read several very interesting ones from the gentlemen, I thought I would send you an account of a 400-mile tour I had with my husband last summer on a small Benz car. We started from Southend-on-Sea on Sunday at 10.30 a.m., driving through Chelmsford and Epping to Waltham Cross, where we were detained about two hours on account of rain. The weather having cleared a little in the afternoon we ventured as far as Barnet to call on some friends. Continuing through Watford with the intention of running to High Wycombe, we unfortunately took the wrong road from Watford and went several miles out of our way through Uxbridge, consequently we only got as far as Tetsworth, where we put up for the night. Leaving there on Monday about 10 a.m. we drove into Oxford, where we obtained petrol, and visited most of the places of interest. We left about 4 p.m., and after a few miles run on the Woodstock road we stopped to oil up, when a coach passed us. The guard, I suppose thinking it could be nothing less than a breakdown, enlivened the scene with the air of "Oh, dear, what can the matter be?" on his horn; unfortunately we were going in the opposite direction, or could have shown them there was very little the matter. After some

refreshments at Shipston we drove to Chipping Norton and called on friends. I think the whole inhabitants must have turned out to see the car, they being the most enthusiastic of any town we passed through. We then drove on to Stratford-on-Avon, arriving about 7.30, only just in time to secure comfortable quarters. On Tuesday we left Stratford after lunch and visited Leamington, Warwick, Kenilworth, and Coventry, where we obtained petrol, and arrived at Leicester about 6.30, the roads being fairly good. Leaving the Red Lion Hotel, Leicester, 10 a.m. Wednesday, we unfortunately took the wrong road, and found the only way, unless we returned, was by a bridle path over about half a dozen fields. We chose the latter; and fortunately the children were only too anxious to open the gates, which saved us dismounting. We arrived at Uppingham in time to lunch with the farmers, it being market day, and found them very favourably impressed with motor-cars. Resuming the journey through Rutlandshire, we reached Peterborough, where we obtained petrol, and then ran on to Wisbech and King's Lynn, arriving about 7.45 p.m. On Thursday we left King's Lynn about 9.45 a.m. and turned towards home, driving through Downham Market along the banks of the Ouse to Ely, and then on to Cambridge, where we spent three hours visiting friends and obtaining petrol, etc. Afterwards, taking the road through Saffron Walden, Dunmow, and Chelmsford, we arrived at Southend at 11.30 p.m., having had a very enjoyable drive.

The only trouble we had with our car the whole distance was in adjusting the belts, which we were over careful in shortening, having only had our car—a 1898 pattern Benz—a few months, and very little time to devote to it.

Yours truly,

Victoria House, Southend-on-Sea,
April 7th, 1900.

E. W. FOSTER.

A TRIAL OF THE CULASSE-BUCHET.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having recently had an old 1½-h.p. tricycle fitted with a new cylinder 70 mm. bore, provided with the Culasse-Buchet, with the valves at the top of the cylinder instead of at the side, a short account of the first trial run from Manchester to London may be of interest to tricycle users. Starting from near Manchester on Sunday morning the tricycle soon settled down into steady work, and I found that the speed was perceptibly increased and the exhaust seemed to get away particularly clear, very little overheating resulting from the use of the large bore cylinder. The machine also went up hill much stronger, the speed was quite 25 per cent greater, and the petrol consumption was very low.

The roads all through were in excellent condition, particularly south of Coventry, excepting about the last thirteen miles through Middlesex into the City. Altogether the Culasse-Buchet is a very marked improvement on the usual form of engine, and presents no difficulties with it.

Yours truly,

April 9th, 1900.

D. H. SIMPSON.

GUARANTEEING AUTOMOBILES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much surprised to read in your last issue that a correspondent, signing himself "Cycle Agent," should suggest that guaranteeing motor-vehicles would increase the trade in them.

At the present time it seems to me that quite a sufficient guarantee is given. Most respectable manufacturers guarantee their goods from bad workmanship or material for three months from the date of purchase, and unquestionably this is quite long enough to test these points, and how it is possible for any manufacturer to give any other kind of guarantee I fail to see, as a customer might easily ruin his vehicle within twenty-four hours of buying it.

I myself cannot see why anything more is necessary to try and popularise motor-vehicles than is being done at the present time. Everyone who has a good article for sale has more orders than he can immediately meet, and what is the good of asking a

lot of new people to come and buy good automobiles when good automobiles are not there for them to buy? My opinion is that the whole industry is moving along in a very satisfactory way, slowly—and for a very good reason why—because motor manufacturers are not made in a day, and those who jump into the business and think they are, will surely result in putting bad vehicles on the market, harmful both to themselves and to the industry as a whole. Good vehicles will do the business much more good than large paper guarantees and bad vehicles.

Yours truly,

7, Tavistock Chambers,
Hart Street, W.C., April 10th, 1900.

S. F. EDGE.

THE DAIMLER MOTOR-CAR.

(Concluded from page 70.)

IN connection with the report of the exhibits at the National Show at the Crystal Palace (see *Motor-Car Journal* for November 24th, 1899), we published an illustration of the 1900 pattern Daimler car, which is known as the Daimler Parisian. Compared with the earlier cars the principal departures are the adoption of sloping wheel and screw steering, the

foot lever projecting upward through the floor of the car. A spring at the left end of the clutch shaft keeps the clutch pressed into the fly-wheel when running, and the same is released by pressing the lever down with the foot. This, of course, disconnects the motor from the driving gear, and so cuts off all propelling power, when meeting with a block in the traffic, etc. The driving gear is arranged by means of hardened spur wheels on the clutch shaft which transmit the power to an intermediary shaft above, which again drives the main counter-shaft by means of bevel wheels. There are two bevel wheels on the last-mentioned shaft, one for forward driving and one for reversing. Either of these are put into gear by means of a thrust bearing actuated by a hand lever in easy reach of the driver, which makes the reversing as easy a matter as forward driving. As already mentioned, there are four different speeds, which are arranged by four different gears on the clutch and intermediary shafts (Fig. 13). On the former they are fitted on to a square sleeve (a portion of the shaft, of course, being square), which allows the same to be moved to the right or left along the shaft, so that the speed of the carriage can be changed at will. To obviate any liability of stripping the cogs when changing the speeds it is necessary to press down the foot lever actuating the clutch, throwing out the latter, so as to take all strain off the

FIG. 12—SECTIONAL VIEW OF GEAR-BOX AND CLUTCH ON DAIMLER 6-B.H.P. CAR.

control of the variable speed gear by levers on the outside of the body at the right hand side instead of by levers working in a quadrant on the steering standard, and the adoption of aluminium wherever possible with the view of reducing the weight of the vehicle. Fig. 13 of the accompanying illustrations gives a rear view of the 1900-pattern car with body removed, which in addition to the features above named shows the Drake pressure lubricators referred to in our last issue, and the cooling coil, with which all Daimler cars are now fitted. Having in previous issues referred at length to the motor fitted on the Daimler vehicles, a few lines may now be devoted to the transmission of the power developed by the engine to the rear road wheels. As is known, four forward speeds and reverse motion are generally provided on this type of car. The motor, which is located in the fore part of the frame, is connected to the driving gear by means of a conical leather-lined clutch fitting into a corresponding recess in the fly-wheel (see Fig. 13). This is arranged in two separate parts, viz., an inner clutch and an outer one. The former protrudes forward from the outer clutch, is of smaller diameter, and is mounted on springs. The latter is perfectly rigid on its shaft, consequently when letting the clutch into the recess of the fly-wheel the inner clutch gives to a certain extent, and so allows the carriage to start smoothly instead of with a jerk, as would be the case if the whole clutch were perfectly rigid. This clutch is actuated by a

gear wheels. The clutch and intermediary shafts run longitudinally down the centre of the frame, and the main driving shaft transversely at right angles across the frame. The latter mentioned shaft is fitted with a differential gear in the centre. At the ends of this shaft are the chain driving pinions, which are connected up to sprocket wheels on the rear wheels of the carriage by pitch chains. All parts of the variable speed, as will be seen, are encased, and run in thick lubricating grease.

THE Construction Liégeoise d'Automobiles, of Liège, Belgium, licensees under the Duryea patent, have completed their first carriages, which weigh 850lb. and have the main mechanical features of the 1898 model of the Duryea Motor-Wagon Company.

THE New York Assembly has passed a bill providing for the licensing of all persons operating automobiles or motor-carriages upon the public highways in the State. Where there is no board in charge of the licensing of stationary engineers, the Board of Supervisors of the county is to appoint a person in each town in the county to examine applicants for automobile licences. The person making the application for the certificate is to pay the examiner 1 dol. The vehicle is to be tested as to its safety.

THE HEALTHY PROGRESS OF THE AUTOMOBILE.

IT would really seem that there is nothing in sight in the mechanical world more sure than the future of the automobile. It is not, even now, something that is yet to come, for it is here. It is coming along in a most healthy and natural way. It is more of a luxury than anything else now, and it may not get far beyond that for a long time, but it will later become a popular convenience, and then a universal necessity of modern civilisation. The other day a lady of wealth with a party of friends visited the New York Navy Yard, and they were conveyed in five automobiles; we hear of many automobile theatre parties, and other similar employments of the revolutionary vehicle. These parties usually make use of the automobile cabs, but, besides these, private vehicles are becoming numerous. A Sunday afternoon walk on the uptown avenues of New York will give a sight of a considerable number of motor-cars of various styles.

The motor-car is, of course, still in the experimental stage, and much money is being spent upon machines soon to be superseded. Wealth, seeking only its own, is still working to produce ultimately the best and cheapest for us all. The public is clamouring, of course, for "useful" vehicles, for auto-trucks that will be cheap and handy for conveying merchandise, for motor-omnibuses and such things. It is just as well to be in no hurry about it. The essentials of the pleasure carriage are not different, after all, from those of the truck or delivery wagon, except that they are more exacting as to speed, endurance, comfort, and convenience. As the greater includes the less, so does the successful pleasure carriage embody the possibilities of satisfying all the conditions of all lines of service, and those, therefore, who are now working only to produce what they consider the highest class of vehicles are really working for all.

The magnitude of this one task which the modern engineer finds himself confronted with is sufficiently shown in the slowness of his progress towards its solution. A writer was saying only a month or so ago that an automobile "must, perhaps, be nearly as complicated as a linotype machine, and its invention calls for as much forethought and simultaneous consideration of a hundred eventualities as was expended on the latter before it became so perfect as it is to-day." Surely no one familiar with the linotype machine could for a moment think of comparing the most elaborate automobile of to-day, with it, and surely, also, no one can think that the line of progress toward automobile perfection is in the direction of increased complication; and yet the latter part of the above quoted assertion is certainly understated. Vastly more thought and planning will be demanded and expended upon the automobile than was put upon the linotype machine to even approach the satisfactory accomplishment of the proposed results.

The task of producing the linotype machine and the automobile are quite different in kind. There is nothing that we are waiting for to put into the automobile. No startling invention is called for, and none probably is coming to solve our problem. All the mechanical essentials are complete and ready to our hand, and combination and adaptation, rather than pure invention, are what is called for. Many of the things, however, have come to hand only within a few years, and especially as to the materials to be used, and the ready parts of the machine in detail. The bicycle has throughout its marvelous development been preparing the way for a vastly greater machine than itself. The tubing, the wheels and tires, the ball bearings, perhaps the sprocket and chain, the steel for every part, the numerous products of the screw machine—all come in as essentials of the manufactured automobile. The motor is, of course, the central and pre-eminant requisite of the machine, and it is only a matter of choice or of resolute insistence as to which to use. Lighter motors than it is now possible to produce could scarcely be asked for, and economy of fuel for the power developed is also satisfactory. Vehicles employing different types of motors may develop side by side with special advantages for each.

The enthusiastic designer of automobiles may easily be led to forget what is wanted, and the purchasers of the first automobiles also may forget precisely what they want. We want, perhaps least of all, a racing machine. Speed records will never establish permanently any type of machine, because we will seldom be able to use them at high speeds, and will less frequently want to. The typical horse, who has been such a valued helpmate of man, is not the racehorse. Neither is the making of long runs over rough roads the thing alone to be kept in sight in designing the vehicle. Thousands of horses, especially around our cities, never go more than ten miles from home, and never see a piece of rough road. As to running upon rough roads, there may be such a thing as being altogether too accommodating. Let the roads, to some extent at least, be smoothed for the machine, and let not all the concessions be made by the machine. Let us first try to produce serviceable, ever-ready, and easily-managed vehicles that will run upon good roads without costing too much, either at first or for repairs, and let us use them and find pleasure and

FIG. 13.—REAR VIEW OF FRAME OF 1900-PATTERN DAIMLER 6-H.P. CAR. (For description, see opposite page.)

comfort and convenience in them upon our good roads and for comparatively short runs, and when this service is fully established improvements will follow rapidly, until we will be able to go everywhere and do everything with them.—By TECUMSEH SWIFT in *American Machinist*.

DIE DORTMUND MOTOR UND MOTORFAHRZEUGFABRIK (LUTZMANN AND HAGER) is the style of a new concern which has just been formed at Dortmund, Germany.

The American Cycle Company, Wausau, Po'and, would like to secure the agency for some manufacturer of petrol motors and motor-vehicle parts. They report a demand for $\frac{3}{4}$ -h.p. motors to propel bicycles.

THE Bavarian and Austrian Automobile Clubs are planning a race from Munich to Vienna, to take place early in June. The participating vehicles will be classed in four groups: Class 1, racing cars; 2, touring cars, weighing over 400 kilogrammes; 3, voituresses, under 400 kilogrammes; 4, motor-cycles. The race will be carried out according to the new racing regulations of the Austrian Club.

THE MERCIÉ TWO-SPEED GEAR.

AN ingenious two-speed gear for use on motor-cycles and light voituresses has lately been devised by M. Jules Mercié, and is being put on the market by Messrs. Malicet and Blin, of Rue des Quatre Chemins, Aubervilliers (Seine), France. As will be seen from the general view (Fig. 1) the gear which is entirely enclosed occupies but a very small space. From Figs. 2 and 3, which give respectively a view of the gear with cover partly removed and a sectional plan, and the following

FIG. 1.—GENERAL VIEW OF MERCIÉ TWO-SPEED GEAR AS APPLIED TO A MOTOR-TRICYCLE.

description, the operation of the apparatus will be easily followed. It will be observed that the motor shaft *M* is longer than usual, and extends into the gear box. The driving pinion *P* is not keyed on this shaft, but is fixed on a sleeve running loose on the shaft—this sleeve terminates at its inner end in a number of *griffes* or equally-spaced projections *G*, similar *griffes* being also formed on the exterior close to the end as shown at *G*². On the motor shaft to the right of this sleeve is a second sleeve, *A*, provided at both ends with *griffes*, *G*¹ *G*⁴, similar to those marked *G* (Fig. 3). This sleeve *A* is

FIG. 2.—VIEW OF GEAR-BOX WITH COVER PARTLY REMOVED.

so fixed that while it must rotate with *M*, it is free to be moved either to the left or the right along it. Surrounding the sleeve *A* is still another sleeve *B*. The last named is provided with *griffes* *G*³, a spur pinion *D*¹, and a groove *F*, in which the operating lever works. It should be explained that the sleeve *B* does not rotate with that marked *A*, but, like the latter, can be made to move either to the right or left, the two sleeves *A* and *B* in this respect acting in unison by means of the key *K*. To complete the description of the various parts shown in the gear box, we find a special pinion *D*¹, special so far that it also is provided with *griffes* at *G*⁵; parallel with the motor shaft is a second shaft carrying a pinion *D*² continually in mesh with *D*¹, and another pinion *D*³ gearing with *D*⁴.

Let us now examine the operation of the gear. To allow the motor to drive the tricycle at its normal speed—the high gear—the sleeves *B* and *A* are pulled over to the left. This brings the *griffes* *G*¹ *G*⁴ into contact, with the result that the sleeve *A*, which always rotates with the shaft *M*, drives the sleeve on which the pinion *P* is keyed. It will be observed that when this is done none of the additional pinions, although in mesh with one another, are rotating. To pass from the high to the low gear the lever is moved so as to pull over the sleeves *A* and *B* to the right. This brings the *griffes* *G*⁴ and *G*⁵ into contact, and at the same time the *griffes* *G*² *G*³; when this is done the power is transmitted through the sleeve *A*, the pinions *D*¹, *D*², *D*³, *D*⁴, and the *griffes* *G*² *G*³ to the sleeve on which the pinion *P* is mounted, the latter—on the low gear—being only rotated at half the speed of the motor. Not only does the gear give two speeds, but there is a central position for the sleeves *A* *B*, in which none of the *griffes* are in contact, so that it is possible, in this way, to instantly throw out the motor from the transmission, when meeting a block in the traffic, etc. Another advantage is that it enables the motor to be started by means of a detachable handle. To allow this to be done the shaft carrying the pinion *D*¹ is made hollow, allowing the stem of the starting handle to be fixed on the end of the motor shaft *Q*. Among the many points of advantage claimed for the Mercié gear is that it is not attached, except by the controlling levers, to the frame in any

FIG. 3.—SECTIONAL PLAN.

way, but is supported by the crank-case of the motor, so that the effect of any jolting is transmitted equally to both motor and variable gear.

TWENTY-TWO licences have been granted to drivers of motor-vehicles in Chicago. It is said there are fifty-three yet to be examined.

TICKETS for the special dinner to be held at the Agricultural Hall on Wednesday, April 18th, in connection with the 1,000-mile Trial may be obtained from the offices of Messrs. Cordingley and Co., at the Exhibition, or from the Steward of the Automobile Club, price 2s. 6d. each (without wine).

THE first road test of the racing machine which Mr. Alexander Winton is to take to France to compete for the Gordon Bennett Cup has been made at Cleveland, Ohio, U.S.A. The car is long and low in build, has the customary sloping wind cutter in front, and is provided with a single cylinder motor of the same construction as usual, but of higher power. The trial is said to have given very satisfactory results.

THE Motor Manufacturing Company, Limited, has been registered with a capital of £200,000 in £1 shares, to acquire and turn to account certain patents, patent rights, and inventions; and, generally, to carry on in all or any of their respective branches the businesses of engineers, manufacturers of and dealers in rolling stock and engines. The first directors (of whom there shall be not less than two nor more than seven) are to be elected by the company. Remuneration, £200 per annum each (chairman £300) with a percentage of the profits, divisible.

THE MOTOR-CAR EXHIBITION.

THE "man in the street"—a definite phrase referring to a rather indefinite quality—who, having in view the great show opening at Paris on Saturday, asks an automobilist if he is going to the exhibition, will probably receive a shock on learning that "the" exhibition is held at the Agricultural Hall in Meade Islington, and that automobilists are not thinking of "gay Paree" at all. At least, they will give no thought to French exhibitions, or Easter, or anything else, until the Automobile Club's exhibition closes on April 21st.

For the annual exhibition of motor-vehicles at the Agricultural Hall is regarded by those interested in the development of mechanical traction on the highway as the event of the year, when they have an opportunity of reviewing the advance of a twelvemonth and confirming their steadfast faith in the future of the industry. Since the last exhibition there have been many improvements not only in the design of cars but also in many parts of their construction, and greater reliance can be placed upon the vehicles generally than has hitherto been the case. In fact British makers have rapidly gained ground, and are now turning out vehicles fully equal to any produced on the Continent. Some are also now wisely turning their attention to voiturettes—in which there has been a profitable boom in France. In this department there is room for further enterprise, experience showing that there is a demand for these light two-seated vehicles for ordinary use.

To anticipate the impressions of visitors to the exhibition next week would scarcely serve any useful purpose. Our readers have been kept well informed of the general scope of the display, and it remains but to be said that our columns next week will contain a full and complete illustrated report of the various stands which will go to make up the most representative exhibition of motor-cars held outside France.

The following is a complete list of the exhibitors:—

Adams and Co.	Lafayette Engine Co., Ltd.
Ailsa Craig Machine Co., Ltd.	Lane and Fitte.
Albone, Dan.	Le Carbone
Allard and Co.	Locomobile Co., of America.
Anglo-American Oil Co., Ltd.	London Autocar Co., Ltd.
Apprin, P.	London Motor Van and Wagon Co.
Automobile Association, Ltd.	Marshall and Co.

Joel Engineering Co.	Wolseley Sheep-Shearing Co., Ltd.

SOME NEW LUBRICATORS.

SO numerous are the parts to be lubricated in an automobile that, for the sake of simplicity and convenience, it is customary to employ a single oil-feeding device by which the moving parts of the driving mechanism are automatically oiled. Among the many devices of this type may be mentioned the

FIGS. 1 AND 2.—SECTIONAL ELEVATION AND PLAN OF SERPOLLET LUBRICATOR.

lately introduced Serpollet lubricator, noteworthy for the ingenious, simple means provided for feeding the lubricant. The lubricator is essentially a pump which forces oil from a reservoir into passages leading to the parts to be oiled, and which contains

FIG. 3.—GENERAL VIEW OF ELGIN LUBRICATOR.

no easily-deranged, delicate valves. The oil is constantly returned to the pump and used anew. The lubricator which is illustrated in Figs. 1 and 2, consists of an oil-reservoir, through the lower part of which passes a shaft driven by the motor. Within

the reservoir this shaft carries a piston, which, besides the rotary movement of the shaft, has also a reciprocating motion imparted by a cam spring pressed on a roller rotating about a fixed axis. The piston at one end is provided with a hollow, perforated cylinder having a simultaneous rotary and reciprocating motion within another cylinder constituting the body of the pump, from which the various oil-ducts lead.

During the period of admission, that is, when the piston enters the cylinder, at the same time making a semi-revolution, the admission orifice of the piston-slide communicates with the reservoir: the return orifice at this period corresponds with the entire wall of the pump-body. During the period in which the oil returns, that is, when the piston is on the return stroke and is making the second semi-revolution, the admission-opening is closed, while the return opening passes successively before the orifices of the return passages, discharging into them the oil pumped during the previous stroke. The oil can be returned at a pressure varying between two and fifty-five pounds, by adjusting the tension of a spring pressing on the piston. The lubricator, which is being made with from two to nine lubricating passages, is being manufactured by Messrs. Schaeffer and Budenberg, of London and Paris.

Fig. 3 shows a new lubricating device, made of aluminium recently introduced by Messrs. Eldin and Lagier, of Place Bellecour, Lyons. It is arranged to be fixed within convenient reach of the driver and can be fitted with any number of lubricating pipes, the one illustrated being fitted with eight outlets. The lubricator is operated by the hand-wheel at the top. This does not alter its position, but operates a screw by means of which a compressing piston is moved up or down.

FURIOUS DRIVING CASES.

IN the Edinburgh Police Court, on the 6th inst., Mr. T. Roland Outhwaite admitted driving a motor-cycle in Bruntisfield Place at an over-regulation speed. Mr. Isaac Connell, S.S.C., on Mr. Outhwaite's behalf, stated that the motor-cycle had only been in the latter's possession for two hours. He desired to try it uphill before accepting delivery. He went out to test it on the Bruntisfield gradient, and the speed was not such as to cause inconvenience or danger to anybody. No policeman checked him, and no person was incommoded. The magistrate, however, inflicted a penalty of £5, which was paid.

IN Edinburgh City Police Court, on the 9th inst., James Collins, 20, a motor-car driver in the employment of the Edinburgh Autocar Company, was charged with driving a motor-car in a reckless and careless manner in Lothian Road on the 27th March last; in consequence of this it came into collision with the private carriage of a Leith doctor, damaging the carriage to the extent of £10, and throwing off and injuring the coachman, William M'Iver, who had his left arm sprained. Evidence was given at considerable length, and Billie Forbes Mackay found the charge proven, and imposed a penalty of £5, with the option of twenty days.

At the Bournemouth Borough Police Court, on Monday, before the Mayor (Councillor C. J. Webber), Dr. J. A. Hosker, and Mr. J. A. Parsons, William House, a motor-omnibus driver, of Somerset Place, Boscombe, was charged with furiously driving his motor-car in the Derby Road on March 26th. He pleaded not guilty. General Sandilands, who was standing talking to Colonel Garrett at the time the car turned into the Derby Road, said he noticed the vehicle was going at a swinging pace, and he shouted to the boy conductor, "You're going too fast," but the only response he got was a laugh. Before he called to the conductor he had said to Colonel Garrett, "That's dangerous," referring to the pace which the car was going. Two women with two perambulators and some children crossed the road just before the car passed. The car was coming up the Christchurch Road at a fair pace, and the driver sounded the hooter before he turned into the Derby Road. He believed that if he had had a bicycle he could have caught up with the car as it turned out of the Knyveton Road into the Christchurch Road if he had ridden straight down the Boscombe Hill. Cross-examined by Mr. Bone, who defended House, witness said he would refer him to the fifth proposition of the first book of Euclid if he wanted to know as to the base of the triangle formed by the Knyveton, Derby, and Christchurch Roads. Colonel Garrett corroborated General Sandilands' evidence. P.S. New gave evidence of seeing the defendant after the complaint had been made to him by the first witness, and to his saying he was very sorry. He also said he was always as careful as ever he possibly could be, and if that was going on here he should have to clear out and go back to America again, as he could not do with it. Mr. Bone, in defence, called House, who said that the maximum speed that he could drive the car was twelve miles an hour on the level road. On the day in question he was coming along the Christchurch Road at about eleven miles an hour, and he slowed down to nine to turn the corner. This was a precaution he always took. He considered that speed was perfectly

safe. He had received no complaint from any of the passengers who were riding in the car at the time of the alleged furious driving. He did not hear the prosecutor (General Sandilands) call out to him as to the speed. He had had three months experience of motor-car driving in Bournemouth, going backwards and forwards to Bournemouth eighteen times a day, and had had considerable experience of electric car driving in the United States.—By Dr. Hosker: The gear of the car would only allow her to go at 12 miles an hour on the flat road.—Mr. Bone, in addressing the Bench on behalf of House, pointed out the seriousness of the charge as regarded his client, but the Bench convicted and fined the defendant 6s. and 4s. costs, the Mayor saying he hoped this case would be a warning to the defendant.

ACCIDENT TO A MOTORIST.

GEORGE LEWIS, a professional footballer, of Kirkwhite Road, Nottingham, was removed to the General Hospital, Birmingham, on Monday suffering from a contused abdomen, which resulted from the following circumstances. Accompanied by Harry Sampson, an ex-champion cyclist, also of Kirkwhite Road, Nottingham, Lewis was driving the car at a moderate pace down Hill Street. He attempted to avoid a tramcar and a cyclist at the corner of John Bright Street, and the motor-car ran into a ginger beer cart, Lewis being crushed between the tail-board of the cart and the car. He was advised to remain in the General Hospital, whither he was taken, but preferred to go home.

DE DION v. AUTOMOBILE ASSOCIATION, LIMITED.

THE motion for an injunction restraining the defendants from issuing or causing to be issued any circular or advertisement representing that Messrs. Cudell and Co. are the sole agents of Messrs. De Dion and Bouton, Puteaux, France, or that Messrs. Cudell hold the patents of Messrs. De Dion and Bouton, or representing that the plaintiff syndicate are not the agents or are not the sole agents in England of the plaintiffs De Dion and Bouton, or making any other representation calculated to injure the plaintiffs in their business, came before Mr. Justice Stirling on the 6th inst. The plaintiffs were represented by Mr. C. F. E. Jenkins, Q.C., and Mr. O. Leigh Clare, M.P., and the defendants by Mr. S. O. Buckmaster. Mr. Jenkins proceeded to open the case, and whilst he was doing so Mr. Buckmaster offered to give an undertaking until the trial of the action that the defendants would not issue any circular representing that Messrs. Cudell and Co. were the sole agents of Messrs. De Dion and Bouton. Mr. Jenkins expressed his willingness to accept this with the addition that it should be extended to any representation that Messrs. Cudell and Co. hold the patents of Messrs. De Dion and Bouton for the United Kingdom, but Mr. Buckmaster would not agree; the Judge, however, after referring to the affidavits, said that the defendants must undertake not to represent that Messrs. Cudell and Co. were the holders of the patents for the United Kingdom, and Mr. Buckmaster gave way. The Judge accordingly directed the motion to stand until the trial, the defendants undertaking until judgment or further order not to represent by circular or otherwise that Messrs. Cudell and Co. are the sole agents of Messrs. De Dion and Bouton, or that Cudell and Co. hold the patents for the United Kingdom of Messrs. De Dion and Bouton, the undertaking being given without prejudice to any question.

A SQUAD of police automobilists is, according to the New York correspondent of the *Morning Leader*, about to be established in that city.

DURING the last financial year La Société des Automobiles Peugeot, of Audincourt (Doubs), turned out 300 motor-vehicles as compared with 175 in the preceding year.

AT a recent meeting of the Electrical Section of the American Institute in New York, Mr. R. A. Fliess, engineer, gave a historical account of the development of the automobile. He stated that the first idea of the automobile originated among the ancient Egyptians, and that attempts to build a self-propelled vehicle could be traced through the Middle Ages.

The toll for motor-tricycles at Dunham Bridge on the Retford-Lincoln road will in future be sixpence, and for cars one shilling and sixpence. The former charge was four shillings per vehicle, and for the reduction thanks are due to Mr. Wilkinson, hon. sec. of the Lincolnshire Centre N.C.U., who has been acting as local secretary for the Automobile Club 1,000-mile Trial.

THE Detroit Automobile Company, Detroit, Mich., have finished their first motor delivery van, which is now undergoing tests for the collection of mails in that city. The wagon weighs about 1,200lb., aluminium and gun metal having been liberally employed in its construction. The axles are of nickel steel. The company has several other styles in process of construction and expects to be turning out ten vehicles a week by the middle of April.

THE Motor-Car Journal.

VOL. II.]

LONDON, FRIDAY, APRIL 20, 1900.

[No. 59.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ALTHOUGH the "exigencies of the situation"—to quote a much-repeated phrase—require the enlargement of the *Motor-Car Journal* this week, the price has been maintained at the popular penny. Without seeking to discourse upon the merits of the current number, we feel that the enterprise evidenced in our pages will be appreciated by our readers, who will regard our present issue as an interesting and valuable souvenir of the great exhibition, in which their interest has been aroused. In addition to a complete report of the many stands at the Agricultural Hall, we publish the impressions of an exhibitor as they occurred to him day by day. Naturally he regards the matter almost wholly from a business standpoint. In our "Exhibition Echoes" are a series of chatty notes on many points of more or less interest, and, altogether, the exhibition predominates largely in our pages. The forthcoming 1,000-mile Trial is also responsible for our bulkier proportions this week, and the paper by Mr. Rolls will provide suitable reading for those who venture thereon next week. In consequence of these matters our usual features have been necessarily somewhat curtailed, but there is sufficient of general interest to sustain the position attained by the *Motor-Car Journal* as a representative organ of British automobilism.

The Exhibition.

OUR issue this week is mainly devoted to the exhibition at the Agricultural Hall, Islington. Doubtless those of our readers who have been sufficiently near London to pay the display a visit have already done so: while the applications for catalogues (post free 9d.) show the interest felt in the exhibition by many distant automobilists unable to come to town. It remains but to be said that the exhibition will continue open to-day (Friday) and will close to-morrow (Saturday), when the exhibition of the vehicles entered in the 1,000-mile Trial will give an additional feature of great interest—sufficiently interesting to lead many people to pay a second visit to the Agricultural Hall.

The 1,000-Mile Trial.

INTEREST in this great event is quickening every day, and our issues for the next month will record its progress and chronicle its incidents. This week we publish the latest arrangements made for the Trial, which will start punctually at 7 a.m. next Monday from Grosvenor Place, W. On another page we give the final list of entries and also a rough plan of the arena at the Agricultural Hall, Islington, where the vehicles will be exhibited on Saturday. In connection with this we are asked by the Committee of the Automobile Club to say that all vehicles entered for the Trial should be at the Hall not later than 10.30 a.m. to-morrow for examination by the judges, and that no vehicles are to be removed until they have

been sealed. No vehicle is to be withdrawn before 9 p.m.—so that visitors to the exhibition at any time during the day will have an opportunity of seeing all the carriages, etc.

Petrol or Motor-Car Spirit.

FOR the convenience of those who are going on the 1,000-mile Trial, both the Anglo-American Oil Company, Ltd., and Messrs. Carless, Capel and Leonard have issued a list of agents for Pratt's motor-car spirit and petrol, respectively, in the various towns through which the forthcoming 1,000-mile Trial will take place. These lists should be extremely valuable to all motorists, and both firms will be pleased to supply them to those who tour.

Annual Police Notice.

THE Commissioner of the Metropolitan Police has issued a notice to automobilists. It is not, says *Country Life*, of a special character in any sense, but merely sets forth in detail the regulations of the Highway Act and the Local Government Board in so far as they concern the driving of motor-vehicles. Presumably it will be issued annually, in the same way as the Commissioner's 'notice to cyclists,' and will be equally superfluous, inasmuch as every automobilist knows well enough what the provisions of the law are in regard to the use of his vehicle on the highway. Moreover, these placards are merely hung up as a rule inside a police station, so that even if they contained any item of valuable information they would not reach the parties to whom they refer. It is a pity, by the way, that when the Commissioner does issue a special placard, instead of those which merely summarise the regulations of certain Acts, some means could not be arrived at by which not only would it be more widely circulated, but also that its provisions should be enforced. Last year, for example, the Commissioner published a request to the drivers of slow-moving vehicles that they should keep near the kerb instead of encroaching upon the trotting line, a request which, if rigidly adhered to, would do more to relieve the congestion of traffic throughout the metropolitan area than anything but the whole ale introduction of motor-cars could possibly accomplish. As a matter of fact, however, the drivers of slow carts, which are the curse of London traffic, continue to go on in the same old way, and appear likely to remain a nuisance for a long time to come.

Motor Racing.

ELSEWHERE we report the conversation of one of our representatives with Mr. Charles Jarrott, whose record race at the Crystal Palace on Monday places him in the foremost position among riders on the British track. His views with regard to the progress of automobilism are of special interest at the present time, and those who accept the ideas of the Hon. C. S. Rolls on the subject will be interested in the opinions of Mr. Jarrott on the same matter. Mr. Rolls is an enthusiast with regard to racing. Mr. Jarrott restrains himself, and is

rather inclined to regard motor racing as a more or less transient sport. There must certainly be a limit somewhere, and on the Continent that limit is fast being reached. With Mr. Jarrott as record-breaker we shall probably soon reach finality on the English track.

Motor-Cycle Racing in America.

ARRANGEMENTS have, we learn, been made for a motor-tricycle race to take place at Boston, about May 1st, between Mr. Kenneth A. Skinner, United States agent for the De Dion motors, and Mr. Albert Champion, an expert French racer, who will ride an "Orient" tricycle, propelled by an Aster motor. The distance will probably be 100 miles, and the motors employed will, states the *Horseless Age*, be limited to 2½ h.p. in order that the speed attained may not be too great. From the same source we also learn that Mr. C. G. Wridgway has accepted the challenge of Mr. Skinner to race any motorist in America for a distance of fifty miles and upwards, either upon a track or road, to be ridden off within a month.

A New Benz Car.

DURING the week Mr. E. J. Coles, of Messrs. Hewetsons, Ltd., showed us in the yard at the Agricultural Hall a new type of Benz car, which he is going to drive through the 1,000-mile Trial. The car possesses several new features, but as it is as yet only in an experimental stage, we are not permitted to publish the details. We may mention, however, that the

MR. E. J. COLES ON A NEW BENZ CAR.

Photo by]

[A. Cornell, Tonbridge.

water tank is placed in front instead of at the rear, as in the ordinary Benz cars, and that a radiating coil and pump are provided. Mr. Coles drove the car illustrated from the Agricultural Hall to Tonbridge on Good Friday last, a distance of 35 miles, in 2 hours and 10 minutes without a stop. Its behaviour during the coming Trial will be watched with interest.

A Scotch Motor-Car Service.

MUCH has been heard of the competition that is likely to be felt between tramways and motor-cars in the future, and in some places the latter are coming to the front to the detriment, or in place of, the former. At Torry, near Aberdeen, considerable feeling has been caused by a Parliamentary Select Committee having blocked a proposed tramway service between that place and the City of Aberdeen. Instead, however, of merely bemoaning their fate, the traders and householders of the district have bestirred themselves with a view to the formation of a motor-car service. Already estimates of the price of motor-cars have been secured from the leading motor-car depôts in Aberdeen.

The intention of the syndicate which has been formed is to begin by purchasing four motor-cars and establishing a system which shall provide full facilities for the inhabitants in every part of Torry to reach Union Street, Aberdeen, cheaply and expeditiously. It is estimated that the capital requisite to float the syndicate at the outset will amount roughly to £4,000. That sum has been promised—a guarantee has not yet been considered necessary—by twelve house proprietors, and the gentlemen who constitute the syndicate are inclined to limit the number of the "trust."

To Commence at Once.

AFFAIRS have reached the stage when, if all things favour, the service may be started at once. The only hindrance is the provision of motor-cars. There are only one or two cars for sale in the city depôts which would meet the requirements of the syndicate. It is confidently asserted, however, that motor-cars, capable of seating from half a dozen to a dozen passengers, will be procured immediately, and the service formally opened. The whole project is in the hands of the energetic committee armed with practically full powers, and, unless something unforeseen occurs, the system of motor-cars between Aberdeen and Torry will be in full running order within a couple of weeks. Of course there is no doubt in the minds of the promoters that the scheme will succeed at first; whether it will continue an attraction remains to be seen—the probability seems to be that it will. At any rate there can be no doubt that it will have the hearty support of the inhabitants of Torry and of the public of Aberdeen generally.

Fire at a Motor-Car Stable.

OWNERS of motor-car stables should pay particular heed to the lamps used when cleaning operations are in progress, a fact which has just been emphasized by the fire at a depôt at Pokesdown, Bournemouth. It appears that Mr. C. Goodridge, the second engineer in charge of the night workers, was engaged overlooking the cars and getting them ready for the day's work about two a.m., in company with another employé, when a lighted paraffin lamp he was using exploded, burning him rather severely about the hands and body. The blazing oil spreading over the floor set the place in flames, and the uninjured employé ran out and gave the alarm. Several of the police hurried to the spot and endeavoured to put out the fire. The fire brigade came on the scene with commendable speed, and securing a good supply of water from the hydrant soon put out the fire. The motor-car stable was formerly known as Parkwood Hall, and had been used by Mr. Bell for some months. It is a galvanised iron structure, with match board lining, and the woodwork was very much scorched in places. Two of the motor-cars were badly damaged, but can be repaired in due course. Another car was slightly injured. The car services will be continued as usual, except that for a time there will only be four cars running instead of five. Visitors to the exhibition at the Agricultural Hall will see some useful lamps specially designed to prevent such accidents.

Proposed Motor Union.

PRESSURE on our space prevents us from publishing a long and interesting letter we have received from Mr. A. G. Wilson with regard to motor-racing rules. After reviewing the present position of those who indulge in motor-racing he invites all interested parties—i.e., motor owners who have raced, or who intend to race, and race promoters who have promoted, or intend to promote, motor races—to write to him their views upon the question of whether it is desirable to inaugurate races under the rules of the N.C.U. or the A.C.G.B.I., or to form a Motor Union and "chance the consequences."

AUTOMOBILISM IN AMERICA.

—8—
VIEWS OF MR. C. JARROTT.

INSULAR Englishmen are inclined to regard their climate as one of the least favoured in the world, looking upon it as a variety of displeasing circumstances with few mitigating pleasantries. That other countries have equally unaccommodating weather conditions has, however, often been demonstrated, and the latest witness to that fact is an automobilist of renown. Mr. Charles Jarrott lately returned from a trip to the United States (writes a representative of the *Motor-Car Journal* who interviewed him), and the opening of our chat turned on the weather—a very conventional introduction, but one that, nevertheless, must be regarded as quite natural under the circumstances.

"Unfortunately," said Mr. Jarrott, "the weather during my stay was not only unsuited for much motoring, but its variability was more a question of degree than of actual change. Some nights the temperature dropped 46 degs., and from the middle of January, when I landed at New York, to the first week of March, when I left, we had a succession of icy cold winds and blizzards."

"But such inconveniences need not discourage the automobilist," I meekly suggested, having in mind the scores of vehicles which were seen in the Metropolis during the bad days of the early year.

"Perhaps not, when there are mitigating circumstances. But we had no consolation. Why, often the snow was a foot deep, and it was necessary to empty the water from one's motor every night, or it would have been frozen by the morning. This was essential after each run. Besides, New Yorkers skate and sleigh when such conditions prevail, and I, being in New York, and remembering the old adage as to following the custom of the country, also indulged in skating and sleighing a good deal of the time."

But Mr. Jarrott did not wholly abandon himself to the new delight, and, mounted on his Ariel quadricycle, disported himself on the bumpy roads of New York whenever possible.

"Evidently my quad was somewhat of a novelty," he remarked, "for as much curiosity was evidenced as would have been the case in England two years ago, and whenever I stopped a crowd gathered with the alacrity with which a London crowd can be got together. You see my quad was a novelty, electric vehicles being the most familiar automobiles in the United States."

"What particular car is to the front just now?" I asked.

"I should say the Winton carriage is the most popular. Certainly very few other gasoline carriages are to be met with. Some very handsome electric vehicles are always to be seen in the streets of New York, and the fact that there are plenty of charging stations throughout the city leads me to suppose that electricity will for a long time have advantages for town work. A great feature is being made by American makers of little cars on the lines of the American 'runabout,' to carry two persons. These are driven by ladies with apparent ease and safety. I expect that ere long a vehicle of a light construction made by the American Bicycle Co.—an amalgamation of more than forty of the bicycle companies of the States—will be upon the streets, that company having recently taken up the subject of motor manufacture."

"Is not the Columbia company well to the front?"

"Yes, and among the interesting motors I saw in New York was that of a parcels carrier built by the Columbia people. The gasoline motor was a single cylinder, water-cooled, with very large radiating plates. I was informed that these carriers are capable of carrying four to five hundredweights, and can attain a very good speed of from twelve to fourteen miles an hour. I understand a considerable number of these are being built."

"Are steam vehicles much employed in the States?"

"They are certainly in use, as may be seen by the inevitable trail of steam which marks their course. They are light in construction and pretty in appearance, but little good for long continuous runs."

"But will electricity always have the practical monopoly?"

"Most certainly no, although the capital invested in its development and the number of charging stations in the United States will give it a great advantage. In the parks I never saw anything but electric carriages. Still I believe the prospects of gasoline are decidedly improving, and many of the manufacturers are turning their attention in that direction, and the eventual recognition of gasoline as the right thing must take place. Perhaps it will come with the greater development of automobiles for delivery work."

"I suppose the outlook for the employment of mechanical traction in such work is promising?"

"Decidedly so, and also for public services. Electric buses are popular in New York, and for comfortable travel I would recommend the electric cabs. A large number of these, fitted with pneumatic tires, are plying for public hire; and, although I do not know much about their financial results, their excellence as a means of conveyance is undoubted. They certainly are a great contrast to the stage-coaches which perambulate up and down Fifth Avenue. These are the greatest funniosities I have seen, with their broken-down and miserable horses looking as though they had been tied up for the purpose of going."

"Did you see anything of the new American Automobile Club?"

"Yes, and found the members keen enthusiasts, and fully determined to secure the advance of the industry—both for purposes of recreation and also of business. I attended one meet of the club, having a seat on Mr. A. C. Bostwick's Winton gasoline carriage. The assembly took place at the Waldorf-Astoria, and I counted about a score of vehicles, mostly electric. Only eleven, however, started for our run of twenty-five miles, the vehicles including four Winton cars and two or three Stanley steamers. The outward journey occupied us one hour and fifty minutes, and we returned in about ten minutes' less time. Only the Wintons and a Stanley steam car survived the test."

"And a short test, too, seeing the runs to Brighton are here regarded as small affairs, and it requires a 1,000 miles trial to arouse enthusiasm and startle Clubland."

"I don't know how far some of the American vehicles would go on a 1,000 miles trial," mused Mr. Jarrott. "But you must remember that the conditions for motoring are very different in the United States to those prevailing in this country. Runs of 150 or 200 miles are there regarded as phenomenal performances, and practically all the motoring that is done takes place in towns."

"What about the roads?"

"Worse than most of the bad roads we know in England. In New Jersey and the State of Massachusetts there are some very good ones, but the ordinary American road is terrible. The main roads are in summer particularly dry and dusty, while all are of very uneven surface. There is no doubt that the development of the automobile will bring about a reform in that direction—for which all men and horses should be thankful. The chief advantage of the city roads of New York, as compared with those of London, consists in their length, and this is especially true of the Fifth Avenue, which runs out along the side of Central Park right into the country. But that is bumpy in many places. Why, even the Broadway is paved with cobble stones."

"Do the local authorities show any encouragement of automobiles?"

"Well, their view of the matter is about as varied as one finds in this country. The police authorities, however, are uniformly keen and watchful, and those mounted on horses or bicycles are particularly observant of their duties. It is no use slowing down to salute the policeman, and having proceeded a hundred yards quicken pace, for the officer invariably follows. And there is no opportunity of being summoned, for automobilists exceeding eight miles an hour are simply locked up. A system prevails, however, by which substantial security can be left for the appearance of the victim in the police court, and the automobile is frequently left by motorists as security."

Mr. Jarrott was much struck with the excellence of the automobile factories he saw—both structurally and in arrangement they bore evidence of skill and thought in design. After

telling me of some of these, he continued: "I also had the opportunity of going over, under the personal guidance of Mr. J. Brisbane Walker, the works of the Mobile Company of America at Kingsland Point, where they are building light steam carriages of the locomobile type. It is one of the prettiest situations for a works I have ever seen, built right out on the banks of the Hudson, a handsome structural appearance, situate in a big clearing with pine trees all round, and fitted up with the latest American machinery. It certainly appeared in every respect a model factory. I was exceedingly interested here to see the very quick manner in which the construction and erection of the carriages took place, and they seem to have a tremendous amount of work in hand."

"By the way," said Mr. Jarrott, as I rose to go, "I have seen it stated that while in America I indulged in racing. Just let me have this opportunity of contradicting that. Much as I should like to have had the opportunity I found no adequate chance. There is a very fair track at Morris Heights, but when I went there with Mr. Wridgway we found it covered with snow, and racing was out of the question. I had hoped to have done something at Madison Square Gardens, but there, again, I was thwarted, as the banked track for cycling races is but a temporary erection. Motor racing to any extent—even to the extent to which it is practised in this country—is not known in the United States."

Recent speeds on the Continent have caused some automobilists to doubt the wisdom of any great encouragement of the idea of racing, and Mr. Jarrott, although one of the fastest British motorists, is not greatly enamoured of the future of that particular section of the sport. His views on this point are interesting and valuable.

"I can see finality to speed in the distance, and even in France I do not think it can go on without some special regulations being made. In track racing the tendency is towards sameness, and that must result in tameness, unless, of course, there is a constant accession of new blood to the ranks of the racing men. And, so far, their number—I refer to the track-racers—has been limited. But the public will not attend mediocre motor races; they will want to see the best racing where the highest speed is allowed and the greatest excitement given."

"And with banked tracks the possibility of danger will increase?"

"Exactly so, and even the most skilful men will run very great risks. Apart from that I doubt the value of such excessive speeds in assisting the maker to improve upon the construction of his vehicle, although I fully recognise that, up to a certain point, racing experience can, and has been, very useful indeed. But it can be overdone."

Although thus not very optimistic with regard to the prospects of racing at home, Mr. Jarrott is sufficiently attracted to racing that he intends to take part in some of the French races this year, and will probably be seen on a 16 h.p. Napier car across the Straits ere long. Looking all round the industry he is naturally convinced of its continued progress, and feels that the United States will quickly make up any leeway it has lost. And by reason of the tariff, which is 45 per cent. *ad valorem* on all automobiles imported, the industry thus created will be purely a home one, little in the way of imported machines being done. In the United States there is the capital and the ingenuity to quickly develop the motor-car, and the many experiments now going on with electric, gasoline, and steam vehicles should result in satisfactory vehicles before many months have passed.

And then, shall we have another American invasion?

THE British and Colonial Motor-Car Company, Limited, has been registered with a capital of £10,000, to acquire the benefit of an agreement between Mr. J. H. Adams and the Aacheuer Stahlwaarenfabrik (vorm. Carl Schwanemeyer) Actien Gesellschaft, and to carry on the business of motor-car, motor and cycle manufacturers, and merchants, engineers, etc. The first directors are Messrs. J. H. Adams, E. C. Barton, O. Selback, and M. De Breyne.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Nice Mathematicians.

WITH the view of aiding the automobilist who desires to find the machine which will give him the maximum of speed and carrying capacity for the minimum of running expenses, Monsieur H. W. Bartol, of Nice, initiated a scheme which was duly carried into effect by the "A. C. N." last Monday. Primarily, M. Bartol's idea was a race, but careful note was made of the weight of each competing vehicle, as well as the quantity of petrol used during the run. The average speed per hour was then multiplied by the weight of the car, and the result divided by the quantity of petrol employed. Under these trying mathematical circumstances it is, perhaps, as well that only nine competitors put in an appearance at the start, while the judges were only required to make their elaborate calculations in the case of six vehicles at the finish, the three remaining cars obligingly breaking down. The itinerary was from Nice by way of Colomars, Vence, and Cagnes, and then through Vence again to Nice, the total distance being 100 kilometres 600 metres, including a hill 9 kilometres in length. The first man home was Pinson, who took 2h. 22min. 59sec. to cover the course, which equals an average speed of 42kil. 21m. per hour. He employed 14.75 litres of petrol *en route*, and if the above quoted formula be applied one obtains the mystic figures—9.329! P. Chauchard was second, averaging 27 kilometres per hour, and using 12 litres of petrol. MM. Johnson, Gondoin, Vogel, and Cléricy finished in the order named, while MM. S. Gondoin, Stead, and Desjoyaux abandoned for various reasons. This class of race, however useful it may be, is not likely to become popular with "course" promoters in France, as it would be far too great a strain upon the mental capacities of all concerned.

Electric Passenger Cars in Paris.

DURING the next six months in Paris the capacities of the public vehicular service will be taxed to their utmost, and exceptional efforts will require to be made by the various public carrying concerns to meet the demand. We have heard that the electric cabs formerly used in London were about to be introduced on the streets of Paris, and now it is asserted that a well-known German tourist agency has definitely decided to put a dozen electric cars in circulation during the Exhibition, in order to assure facility of transport to the clients of the firm. Each of these electromobiles will carry twelve persons, and they are being constructed by a German firm. The idea is undoubtedly an excellent one, for even now it is difficult to get from place to place in Paris readily and cheaply. The number of omnibuses in circulation is perfectly inadequate, and one may wait a considerable length of time before securing a place.

At Antwerp.

THE Automobile Club of Antwerp announces its intention to hold a series of speed trials on Sunday, May 6, these trials to be open only to members of the Belgian Automobile Club and to members of societies recognised by it. Every competitor will be required to make a trial over a kilometre from a stationary start, and another over the same distance with a flying start. The route selected for these tests is that of Putte, the exact place being at Calmpthout, where the road is perfectly straight and in excellent condition. No less than seven categories will be provided for, these being: 1, Motor tricycles; 2, Voiturettes weighing less than 250 kilos.; 3, Voiturettes exceeding 250 but less than 400 kilos.; 4, Cars exceeding 400 kilos. in weight and fitted with motors of less than 10 h.p.; 5, Cars exceeding 400 kilos. in weight and fitted with motor of more than 10 h.p.; 6, Electric cars and voiturettes; 7, Steam cars and voiturettes.

CORRESPONDENCE.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a multitude of counsellors there is wisdom, and perhaps your correspondent, "Engineer," would also like to have my views of a Werner motor-bicycle. I can speak feelingly on the subject as I have had many falls from my machine, the last one laying me up with a broken leg. However, to be just, this fall was not entirely due to the bicycle, as I was run into by a butcher's cart which shot into me from round a corner, but had I been mounted on my motor-tricycle I could have doubled out of the way. On an ordinary bicycle I can do most things, having been an ardent cyclist for years, but, unfortunately, you can do no evolutions on a motor-bicycle of the Werner type.

To begin with, I strongly advise "Engineer"—if he can possibly afford it—to buy something else, at least something with three wheels. The Werner bicycle is a dangerous machine—everyone says so here in France, especially those who have ridden them. At the same time, as motor-bicycles go, the Werner is the best—that is to say, the motor is the best that has as yet been adapted to a bicycle. Also, more of them have been sold than of any other make.

The motor is placed in the best possible position as regards the cooling, but in the worst possible position as regards stability, the centre of gravity, etc. It is very high, which makes the machine top-heavy, and it throws all the weight on the front wheel, which makes riding both difficult and dangerous.

It is all right when you are going along straight ahead with both wheels in the same straight line, but beware of making any movement with the front wheel to go round a corner, or even to avoid anything on the road. You can't move the front-wheel without moving the motor with it, and the sudden weight, over on one side of the machine, has a strong tendency to make the front-wheel skid, and bring down the machine. The balance is very delicate and there is no playing any tricks, or going fast round a corner with a lean on. But the veriest purgatory for the poor motor-bicyclist is wet places—mere damp spots—on the road. You could not ride one yard in mud, so there is nothing to be said about that. You are spinning along quietly at a grand speed, very pleased with yourself, when, without any warning—Crash! and you're down! You then discover you have crossed some slightly damp place.

Sometimes by extraordinary gymnastic feats I have succeeded in sticking on to my machine, but those happy times have been few. Now, whenever I observe a damp spot I jump off and walk, experience having taught me that it is a sheer impossibility to ride on a wet road. I heartily recommend "Engineer" to do likewise.

The great safety in an ordinary bicycle is that you have got the front-wheel light and free and therefore you can remedy almost the worst of side-slips of the back-wheel. But the skidding of the front-wheel on an ordinary bicycle is a very different thing. On an ordinary bicycle it is all you can do to keep your balance when that happens. What then on a motor-bicycle where your front—besides being most inclined to skid itself—cannot possibly help you if you begin skidding with your back!

Of other makes of motor-bicycles here in France the two best known are the Pernoo and the Labre. The former has its motor behind the back wheel, leaving the front part of the machine absolutely clear and light. It is hard to skid on this machine, and you are as safe as on an ordinary bicycle. The only thing there is against having the motor so placed is that the rider and the whole bicycle are directly in front of it, screening it from the necessary draught required for cooling. In spite of that, however, a Pernoo machine won the great French race for motor-bicycles last year, "Le Critérium des Motocyclettes, 1899," beating the Werner and all others. Nevertheless, the Werners have won every other important race. Two of their riders rode in the Nice-Marseilles race, and did very well. Although they had only 1½-h.p. motors, and had to compete in the same class with tricycles up to 6 h.p., Bounard came in close on the heels of the last tricycle of 4 h.p., a very fine performance.

The motor-bicycle built by Lamaudière et Labre carries the motor in the ideal position as regards stability and safety, for it is between the pedals. But I have not had the actual experience of testing one.

A motor-bicycle certainly should be an excellent and extremely useful thing to have. It is the least expensive motor conveyance, it does not take up much room, it costs little to use and to keep up, and also you are sure of getting to your destination—a point of particular merit—because if the worst comes to the worst you can always pedal.

On the other hand, the Werner bicycle is, in my opinion, only a fair weather and dry road machine. It rained the day after the Nice-Marseilles race, when the race should have been completed from Marseilles to Nice, and the Werner professionals rode back—in the train!

If "Engineer" gets a Werner, the two best tips I can give him are to keep his strap as tight as he can get it—a new strap constantly requires pieces being cut off as it stretches very considerably—and not to put in more oil than is absolutely necessary. Remember also that the faster you go with air-cooled motors the better it is for them, and the less likely are you to heat the motor with the consequent damage to the piston. Going slowly for any length of time will ruin your motor. It is rather unfortunate, but that is the worst of air-cooled motors.

My machine is 1½ h.p. with accumulator electric ignition, and was made for me specially for the races this year, in none of which I could take part owing to my having previously broken my leg. It does 31½ miles an hour on the flat and takes most hills without the necessity of pedalling.

"Engineer" should well consider the *pros* and *cons* and if he decides upon getting one I can give him no better advice than what was given me by many French friends when first I had my machine. "Méfiez-vous!" they all said and reiterated "Méfiez-vous! C'est très dangereux!" (Take care, it is very dangerous!)

Yours truly,

LEOPOLD CANNING.

THE HORSE-POWER OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was greatly interested in the article in one of your recent issues on the Testing of the Horse-Power of Motors, and hope at an early date to try the plan suggested by Mr. Oliver. As this gentleman suggests, it is no doubt true that the horse-powers of many of the motors in use are rated—not by how much work they are capable of doing, but by how much work their builders think they ought to do. As the motor-vehicle becomes more popular however, automobilists will not be content with the mere statement of the builders, but will want some proof of the actual capacity of the engine and in this connection it may be interesting to mention that one American concern—the Autocar Co., of Ardmore, Pa.—has decided to take an indicator card from every engine and give it to the purchaser as a guarantee of the horse-power of his motor.

Yours truly,

T. S. S.

Middlesbrough, April 19th, 1900.

THE FIRST MOTOR-TRICYCLE CONSTRUCTED IN IRELAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the owner of the above, and with your permission I should like to give a short description of the machine as I am sure it would interest many of your Irish readers and others, besides give credit where credit is due, namely to Mr. F. Pease, of Waterford, who made the machine. The framework, bearings, wheels, carburettor, induction coil, in fact everything metal, was made by some firm in (I think) Birmingham, at any rate in England, not in France—a dead copy of the De Dion frame; all except the bearings, which are improved upon. The engine is a 2½-h.p. genuine De Dion.

As to running this "trike" has never given me the slightest trouble, and as to speed she proved herself slightly faster than the very most up-to-date De Dion tricycle of same gear. This

speaks volumes, as my opponent was mounted on the latest De Dion, specially chosen for him by Mr. S. F. Edge, and in the hands of such an experienced jockey as Mr. W. G. D. Goff, of Glenville, Waterford, no more need be said. With regard to tires, 3-in. Dunlops are what I use; one of these proved faulty. I pointed this out to Mr. S. F. Edge, who, I understand, represents the Dunlop people in London. Without a moment's hesitation, Mr. Edge wired to Coventry and in a very few days a brand new set arrived. A firm that treats customers like this is worthy of custom.

Yours faithfully,

H. R. LANGRISHE.

76, Queen's Gate, S.W., April 17th, 1900.

DE DION v. AUTOMOBILE ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to your report respecting the action of De Dion and ourselves in your issue of the 13th April, we would take it as a favour if you would kindly insert this letter in explanation.

The undertaking our counsel, Mr. Buckmaster, gave was to the effect that we would not advertise or circularise the statement that Messrs. Cudell were sole agents for the United Kingdom, but this in no way deters us from stating that Messrs. Cudell are sole agents for Germany and patent holders for that country—nor does it in any way prevent us from dealing in and delivering the De Dion-Bouton voiturettes in this country or imply that we are infringing any patent, the fact being that the plaintiffs have taken no action for infringement.

We beg, therefore, to inform you that we are still supplying De Dion voiturettes at the price quoted and that we still guarantee our customers against any costs in defending any actions, etc., as per our advertisement.

Trusting you will insert this short letter in justice to ourselves.

Faithfully yours,

THE AUTOMOBILE ASSOCIATION, LTD.

April 14th, 1900.

A PROCESSION AT RICHMOND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are organising a military tournament and illuminated procession to take place at Richmond (Surrey), on Saturday, April 28th, and should esteem it a great favour if owners of motor-cars would take part in the procession. The funds collected are to be devoted to the Surrey War Fund. I shall be glad to hear from any owners or manufacturers able and willing to assist.

Yours faithfully,

1, The Little Green, Richmond, GERALD FITZGERALD,
April 15th, 1900. Hon. Sec.

AT the Police Summons Court at the Guildhall, London, last week, George Field was summoned for causing a motor-car to stand longer than was necessary for loading or unloading. The boy left in charge could not move the car. Mr. Field was transacting business at the time in a warehouse. The defendant was fined 2s., and costs.

AT a recent meeting of the Automobile Club of America Mr. Clarence Dinsmore was elected delegate to represent the Club at the Gordon-Bennett Cup races in June, and Mr. John H. Flagler was elected vice-delegate to serve in the event of the delegate's absence or disability. Mr. Albert C. Bostwick was chosen delegate to the International Motor Congress at Paris.

MESSRS. CARLESS, CAPEL, AND LEONARD have issued an attractive little handbook of useful information, which also gives a list of the agents for their petrol. We notice a convenient table giving the readings of the densimeter for petrol of standard quality (viz., '680 specific gravity at 60 degrees Fahr.) at various temperatures, from 30 degrees to 90 degrees Fahr. By means of this motorists will be able to tell at once that they have petrol of the right quality and to make the necessary correction if the temperature should not be at exactly 60 degrees Fahr.

THE 100-MILE TRIAL.

—8—

AS announced last week, the 100-mile Non-stop Road Trial organised by the Automobile Club took place on the 11th inst., the route being *via* Uxbridge, Beaconsfield, and High Wycombe to the fifty-second milestone from London and back. Six cars had in all been entered for the competition—two De Dion voiturettes by the De Dion and Bouton Syndicate, Limited, a Marshall phaeton by Messrs. Marshall and Co., an Ariel quadricycle by the Ariel Cycle Company, a New Orleans voiturette by Messrs. Burford, Van Toll, and Co., and Mr. Mark Mayhew's 6-h.p. Peugeot car. When proceeding to the start Messrs. Marshall and Co.'s car was run into by a horse-drawn vehicle and did not take part in the competition. The records of those completing the course are given below.

The De Dion-Bouton British and Colonial Syndicate's De Dion voiturette carried the driver and one passenger; used three gallons of petroleum spirit, which, at 1s. 3d. per gallon, is equivalent to '45 of a penny per mile. The speed on both the outward and return journey was up to the legal limit of twelve miles per hour. There were two stoppages: (a) to adjust trembler and fill up petrol tank as the pipe from temporary oil tank had broken; (b) for restive horse, but further adjustment of trembler was necessary before car could be restarted. The speed over one mile, including Dashwood Hill, was 10.58 miles per hour, and in ascending Aston Hill (1 mile 1,100 yards) 8.2 miles per hour.

The Ariel Motor Co.'s "Ariel" quadricycle carried the driver and one passenger; used 1 gallon 5½ pints of petroleum spirit, which, at 1s. 3d. per gallon, is equivalent to '24 of a penny per mile. The speed on both the outward and return journey was up to the legal limit of 12 miles per hour. There were two stoppages: (a) because the vehicle failed to ascend Dashwood Hill until the passengers had alighted, and (b) to tighten screw in mudguard. The roads were heavy and sticky over the greater part of the journey, and there was a strong contrary wind on the outward journey. The engine gave no trouble whatever. There were no heated bearings, and no extra lubrication was required during the journey. On Dashwood Hill (commencing at the thirty-third milestone and terminating at the thirty-fourth milestone, having a total rise of 241 feet in one mile including 275 yards of a gradient of 1 in 21.7 and 600 yards of a gradient of one in eleven) the average speed was 4.6 miles per hour, the passenger's seat being vacant. On Ashton Hill (a distance of one mile 1,100 yards having a total rise of 386 feet and including 1,910 yards of a gradient of one in twenty-one) the average speed was 12.18 miles per hour. Muscular aid was given to the motor by pedal propulsion at times.

Mr. Mark Mayhew's 6 h.p. Peugeot vis-à-vis carried the driver and one passenger; used 4.46 gallons of petroleum spirit, which, at 1s. 3d. per gallon, is equivalent to '67 of a penny per mile. The speed on both the outward and homeward journey was up to the legal limit of twelve miles per hour. There was only one stop of about thirty seconds to listen if the engine was governing properly. The speed over the Dashwood Hill mile was 6.92 miles per hour, and over the Aston Hill, one mile 1,100 yards, fifteen miles per hour.

The New Orleans car had the misfortune to get some dirt into the petrol tank, from which it got into the jet of the float feed carburettor, which was choked. When this was cleared, however, the run was abandoned.

THE Walden Ridge Automobile Company has been formed at Chattanooga, Tenn., to organise a service of motor-carriages at that place.

WE learn that Mr. R. E. Phillips, the well-known patent agent, has purchased a Petit Duc Mors from the Automobile Association, Ltd.

THE suggestion has been made that a motor-car service should be run from Darlington to Reeth and Richmond. Such a venture, says the *Middlesbrough Evening Telegraph*, during the summer could scarcely fail to be a paying one, considering the very fine scenery to be witnessed *enroute*.

THE PARIS-ROUBAIX RACE.

ON Sunday last the doors of the Exposition Universelle were thrown open for the first time to the general public, but even this event of national importance had no diminishing effect upon the attendance of spectators who assembled to witness the start of the fifth annual race from Paris to Roubaix; indeed, on the contrary, the gathering was larger than any yet recorded on an occasion of this kind. And the reason was not difficult to find, for the usual crowd of cycle and motor enthusiasts who faithfully attend all these *réunions* was on Sunday greatly augmented by the presence of hundreds of people whom the glorious weather had tempted to spend a day in the country, and who eagerly seized the opportunity of witnessing what was to them more or less of a novelty. After the last few weeks of cold and rain which we have of late experienced in Paris the sudden change to warmth and sunshine was very welcome and rendered cyclists and motorists so supremely content that not even the awful journey over that bumpiest of routes which lies between the capital and Saint Germain failed to ruffle their temper. Doubtless the authorities purposely leave this road in as bad a condition as practicable, for its surface restrains motor-men from indulging in high speeds in a way which no laws and regulations could ever attain. Even as it is, vehicles are occasionally driven over it much too fast, and as probably some hundreds of cars make use of the road every Sunday to get out into the country, many of the good people of Rueil, Chatou, Le Pecq, Le Vésinet, and other environs of Paris which border this route feel that they have rather too much automobilism, and that since its coming their suburban homes have lost some of their peacefulness. Our run out on Sunday was, apart from the bumps, quite uneventful, and we ultimately arrived at Saint Germain somewhat sore but otherwise perfectly happy. There we found that, following the now established custom where early starts are the order of the day, a goodly number of competitors had journeyed out from town the previous evening, thereby securing a comfortable night's rest previous to setting out upon their wild career of speed. In this particular instance these were nearly all bicyclists, for whom the *contrôle* opened at 7.30 a.m., the hour of departure being timed for nine o'clock. And here I would remind English readers that there exist in this Paris-Roubaix race two categories, one reserved for bicyclists and one for motor-cyclists; or, in other words, one for muscle and one for motor. Sunday last was the fifth annual occasion upon which the bicyclists have contested the race, and the third upon which the motor men have battled for victory. It was in 1898 that the *Vélo* first included the latter category, and upon that occasion eighteen motorists competed, the victory ultimately going to Degrais, whose time for the 268 kilomètres (167½ miles) was 7h. 29min. A year later the race was much more hotly contested, and after a great struggle between Osmont, Vasseur, and Béconnais the former *chauffeur* gained the award, covering the distance in 5h. 35min. 30secs., a marked advance upon the time made in 1898. This year it was generally anticipated that another slaughtering of the record would take place, and as will be seen later on this expectation was fully justified. But let me get on to the *contrôle de départ*, and as the ordinary cycling contingent probably interest but little English automobilists, I will just permit them to take their departure with but a few remarks, and those relating more particularly to their pacing machines. Each of these latter was provided with a huge wind shield, that upon Levegh's car assuming gigantic proportions. The famous French rider Bouhours was particularly happy in the number and quality of his pacers, as MM. Clément, Gilles Hourgières, Heron, and René de Knyff all lent their valuable assistance. M. Levegh rendered similar services to A. Garin, Voigt and Degrais paced M. Garin, Prince Sagan and Huguet led Fischer, Maurice Farman helped Mion, and Corre paced Lepoutre. At nine o'clock exactly the nineteen competitors were despatched upon their long journey, and the only accidents were a couple of falls made almost immediately by Mion, the second of which caused him to abandon

the race. The first was occasioned by his touching Farman's car, which was pacing him, and then, after mounting a spare machine, his original cycle being damaged, he shortly afterwards again ran into the back of his pacer and was compelled to relinquish the contest.

Once the cyclists were out of sight the officials commenced to busy themselves with the preparations for the motor men, and learning that the level crossing at Achères would be shut until 11.10 a.m., it was decided to postpone the start until that hour. By that time the crowd of spectators had been slightly reduced in numbers, but the officials and police had all their work cut out to preserve a clear course for the first few hundred yards through the forest, at the entrance of which the *contrôle* was placed. The competitors themselves were ranged up in trios, the front rank consisting of Béconnais, Osmont, and Marcellin. They numbered thirty all told, but at the last moment Rigal found it impossible to start, the piston of his engine having come to grief. Another notable non-starter was Teste, whose accident at Pontoise the previous Sunday had rendered him *hors de combat*. The actual participants were—Béconnais, Marcellin, Osmont, Lerod, Baras, Tart, Bathiat, Martin, Lemoine, Vasseur, Demester, Bardin, Girardot, Montbel, Didier-Nauts, Nielsen, Rolland, Collignon, Bardaux, Fournier, Chénard, Labadie, Battaiellie, Villemain, Delisle, Bertin, Prévost, Cousin, and Bonnard, the three latter riding motor-bicycles. Upon the signal being given Béconnais jumped off with the lead, hotly pursued by Baras, and in a moment the whole crowd of "coureurs" was tearing down the road at 80 kilomètres to the hour, leaving in its track a great white cloud of smoke, from the depths of which one heard a roar of motors like the spluttering of many Maxim guns. It is at that moment that one is apt to ask oneself what would happen should any living thing chance to stray across the route before that squadron of motors, which have not yet had time to tail out, but which are simply travelling down the road in a compact column. Should the first man come to grief the consequences would be too terrible to think of; for, by reason of the pace at which they travel and their inability to see ten yards ahead on account of the dust, the following "chauffeurs" could not possibly avoid an accident. On Sunday a very grave mishap did occur, and but for the fact that the competitors had already drawn out somewhat, the consequences would have been even more serious. The accident came about at the famous Croix-de-Noailles, that landmark of all Parisian cyclists, which stands at the point where the Saint Germain-Achères road is crossed by that leading from Maisons-Lafitte to Poissy. Here a considerable crowd had assembled on Sunday to see the racers take the corner at express speed, and fortunately the majority were sufficiently prudent to station themselves well away from the route. Some, however, massed themselves around the foot of the cross, that is to say, practically in the middle of the road, and there waited impatiently for the arrival of the racers, whose departure from Saint Germain, as I have already stated, was somewhat delayed. Suddenly Béconnais appeared, followed by Baras, and one after another the "coureurs" successfully negotiated the corner, until Martin and Dorel arrived practically together. The latter had the inner berth, and would appear to have endeavoured to pass his opponent on the bend, a truly extraordinary idea. At the pace at which he was travelling he could not negotiate the corner, but ran into Martin, and both motor-cycles dashed into the crowd stationed at the foot of the cross. The incident came so unexpectedly and so quickly that the unfortunate people had no time to seek safety in flight before the two machines were into them, and fully twenty were knocked down and rolled in the dust. Fortunately, a number of bicycles lying on the ground before the spectators slightly broke the violence of the collision, but as it was much damage was done. Madame Bos, wife of the Deputy for the Seine, sustained a compound fracture of the leg, M. Biehle a similar injury, and Martin, one of the racers, a broken collar bone. Other persons were shaken and contused, but happily no bones were broken. As for Dorel himself he escaped almost scatheless. Dr. Henri de Rothschild, who happened to be near in his car, immediately came to the assist

ance of the wounded, and after the fractured limbs had been temporarily bound up, Madame Bos and M. Biehle were conveyed to the hospital at Saint-Germain, the former being subsequently conveyed in the evening to the Tenon hospital at Paris. Both are doing well, and their condition gives rise to no misapprehensions. Martin's broken collar bone did not deter him from attempting to renew the race, but after a few attempts he found his machine too damaged to permit of his proceeding, and he was therefore compelled to abandon the idea. Meanwhile the race had, of course, been proceeding, and at Pontoise, 19 kilomètres from the start, Béconnais was leading Baras by one second. At Beauvais, 51½ kilomètres further on, the positions were reversed, while the other men well to the front were Marcellin, Bertin, Girardot, and Rolland. Breteuil, which marked the termination of the first 100 kilomètres, was reached by Baras at 12.37 midday, he having covered the distance in 87 minutes. Marcellin, Bertin, Tart, and Demester followed in the order named, and ultimately Béconnais

It was during this last portion of the journey that both Marcellin and Girardot's machines failed them, while Vasseur broke one of his electric connections, and so permitted Tart to secure the second place. When ultimately Baras made his appearance on the Roubaix track just before three o'clock the tremendous crowd which encircled the arena could scarcely believe their eyes. Three hours and 48 mins. for a journey of 263 kilomètres, the last 62 kilomètres of which were over simply villainous *pavé*—an average speed of 69 kilomètres (43 miles) per hour over such a route! No, it was not to be believed! But there was the proof positive before their eyes—Baras smothered in dust—and then they cheered him until they were hoarse. And what did Baras do? Why, he simply commenced to make the obligatory six rounds of the track on his machine, and promptly toppled over at the very first corner. Fortunately, he was not damaged, but his machine was in a woeful plight, and the winner was compelled to make his six laps of honour mounted on an ordinary bicycle. Forty minutes

FIG. 1.—SIDE VIEW OF STANDARD 1900 DAIMLER FRAME. (See opposite page).

put in an appearance after experiencing many troubles. He decided to dismount his motor, and then found that some unscrupulous individual had doctored his engine by inserting five small balls in the cylinder. The game would appear to be about to be played very low indeed when this sort of thing commences, and we shall soon have competitors sleeping with their machines and safeguarding them with all manner of precautions to prevent tampering. With Béconnais out of the hunt, Baras' position was considerably strengthened, and he continued to increase his lead from the other competitors. At Amiens he had covered 131½ kilomètres in 111 minutes, being 14 minutes ahead of Marcellin. He reached Doullens at 1.34 p.m., and it is worthy of note that at this point Mlle. Léa Lemoine was tenth, her time for the 161½ kilomètres being 188 minutes. I fancy that there are not many lady motor-cyclists who would care to drive a machine at that speed. The order at Arras, which marked the finish of the 200th kilomètre, was: Baras at 1.58 p.m.; Marcellin at 2.20 p.m.; Girardot at 2.23 p.m.; and then Tart, Vasseur, and Demester. Baras had thus made the 200 kilomètres in 168 minutes. Average speed, 70 kilomètres, or nearly 44 miles per hour. During the next 36 kilomètres he gained a couple of minutes more on Marcellin, and it is interesting to observe that in the same distance he gained 40 min. over the cyclist Bouhours, who had left Arras with him. From Arras right away to Roubaix the route consisted of *pavé*, and yet these last 62 kilomètres were covered by Baras in exactly an hour.

later Tart put in an appearance, followed twelve minutes afterwards by Vasseur. The official placings were:—

				Time.	
				H.	M.
1.	Baras	3	48
2.	Tart	4	28
3.	Vasseur	4	40
4.	Battaille	5	2
5.	Collignon	5	16
6.	Delisle	5	50
7.	Chenard	6	19
8.	Bathiat	6	29

And by way of comparison it is interesting to observe that the time achieved by Bouhours, one of the finest distance riders in the world, was 7h. 10min. 30sec., and this, too, with the aid of most efficient motor pacing. Another interesting comparison is afforded by noting the time of the fastest train travelling between Paris and Roubaix. This express makes the journey in exactly the same time that Baras occupied in racing over the road, but then the locomotive has twelve kilomètres *less* to travel than had Baras. Still it is not bad time for a train, and with practice it may be brought up to the equivalent of Baras' performance. And now a rest for the motor-cyclists until Sunday week, when Paris-Lille will be decided.

ERNEST M. C. INSTONE.

The Motor-Car Exhibition at the Agricultural Hall.

THE wisdom of holding "two exhibitions in one" has been amply demonstrated at the Agricultural Hall, Islington, this week, and greater interest than ever before has been shown in the display of automobiles there got together. Under the auspices of the Automobile Club of Great Britain and Ireland, and directed by Mr. Charles Cordingley, of the *Motor-Car Journal*, the motor-car exhibition which opened on Saturday last must be pronounced a great success. Not only has public attention been well maintained, but the comprehensive character of the display has fully sustained the interest of automobilists. The Easter excursions have brought a good many people from the provinces, and the arena has been a great centre of attraction throughout the week. Cars have never lacked passengers, and at times there has been quite a rush for seats on the vehicles. The performance of Mr. E. J. Coles has been well received every afternoon as well as evening, while the Ladies' Band has discoursed an excellent programme of music twice daily.

Doubtless the last day (tomorrow) will present the busiest scene of the week, for then the vehicles which are to participate in the forthcoming 1,000-mile Trial will be paraded, and the ceremony of sealing will take place. This event, together with the ordinary attractions, will probably cause many who have already visited the Exhibition to pay a second visit on that day.

One of the most imposing displays in the show is undoubtedly that of the Daimler Motor-Car Company, Limited, London and Coventry. All the cars shown are mounted on the company's standard frame, fitted with 6-h.p. Daimler motor. First we have an elegant four-seated wagonette, with a body painted in light blue, solid rubber tires, and tiller steering. Next to this we find an example of the company's latest production—a mail phaeton with pneumatic tires and wheel steering. Then another four-seated wagonette; a Wyley phaeton to seat five; a ten-seated wagonette bearing the legend "Edinburgh Autocar Company, Limited," several of this type of car being used for public services in the Scottish capital and elsewhere. To those interested in the details of the Daimler motor and transmission gear the northern end of the stand should prove most interesting. Here we find a car with the body removed, so that the motor and driving gear may be inspected. At the side of this

is a Daimler motor, part of which has been cut away so that the operation of the valves may be examined, while another interesting exhibit is that of the variable speed gear. Briefly referring to the other things to be seen, there is a 2-h.p. Daimler engine suitable for 20ft. launch, which it will drive at a speed of 7 miles per hour, a four-cylinder 12-h.p. gravity feed motor, and a couple of light "bodies" constructed mainly of aluminium. Altogether the Daimler Company's exhibit is one of the most interesting and instructive in the exhibition. In several of our recent issues we have illustrated various parts of the Daimler motor and cars, to which we are now able to add a side view of the 1900 standard frame (Fig. 1).

One of the first exhibits to attract attention on entering the exhibition is that of the Motor Manufacturing Company, Limited,

of 47, Holborn Viaduct, E.C., and Coventry. The display is of a very varied character. First we find motor-tricycles fitted with a 2½-h.p. English-built motor of the De Dion type and with the Boon system of opening the exhaust valve from the handle-bar. A two-seated motor-quadracycle enamelled in khaki is also displayed. Of the Motor Manufacturing Company's Panhard vehicles fitted with 6-h.p. motors several are shown. First we see a ten-seated wagonette fitted with omnibus top, built for the

FIG. 2.—THE MOTOR MANUFACTURING CO.'S MARLBOROUGH PHAETON.

Merthyr Motor Car Company. The car is fitted with a 6-h.p. motor, four speeds and reverse, tiller-steering, solid tires. The body of the car is painted in red and black, the omnibus top being in natural wood. A feature of the latter is the adoption of windows of xylonite instead of glass, these having been found to be much more free from rattle than glass. Other cars on view are the Iveagh phaeton, with seating accommodation for five persons, built on the company's standard 6-h.p. frame, and a Granville ten-seated wagonette, with body of natural wood. An example of the latest production of the Motor Manufacturing Company is to be found in the 6-h.p. Panhard phaeton, built to the order of Mr. Charles Cordingley. The car is fitted with all the latest improvements, such as wheel steering, water-cooling coil, speed lever handles at the side. The vehicle is propelled by a 6-h.p. motor, four speeds and reverse motion being provided. Ample brake power is

available, for, in addition to the hand and sprocket brakes, tire brakes, operated by a hand-wheel and screw-gear at the side, are fitted. The car is provided with two bodies, either of which may be fitted to the frame. One is a two-seated racing body of aluminium, with ample room at the back for a spare petrol tank or detachable tiger seat; the other body is known as the "Marlborough" (Fig. 3), having ample accommodation for five persons, and finished in royal yellow and black. The road wheels are of stout construction, shod with solid rubber tires vulcanised on the rim. Other exhibits of the Motor Manufacturing Company comprise specimens of their English-made De Dion motors, both air and water cooled, ranging in sizes from $2\frac{1}{2}$ h.p. upwards; also accessories and small parts of all kinds for De Dion and Panhard motors. Ere the exhibition closes the company hope to have on view one of the large Balmoral char-à-bancs built on the George Iden system, and recently illustrated in these columns.

The Lanchester Engine Company, Limited, of Armourer Mills, Birmingham, exhibit two of their cars which attracted so much attention at the Exhibition last year. One car is a two-seated phaeton, the other a four-seated hooded mail phaeton. The motor, which is arranged at about the centre of the frame, under the seat, comprises two horizontal cylinders, 5in. diameter by 5in. stroke, facing each other in the same line; it is capable of indicating 8 h.p. Two connecting rods are attached to each piston. There are two cranks independent of each other, and two fly-wheels also independent of each other but keyed respectively to the two crank shafts, one of which is 3in. above the centre line of the engine, the other 3in. below it. One connecting rod from each piston goes to the upper crank pin and one to the lower, a kind of diamond-shaped linkage when the pistons are at mid stroke being thus formed. It may also be stated that the two crank shafts revolve in opposite directions, while to counteract any vibration balance-weights are attached to the connections of the crank webs. Another feature of the motor is that no water-jacket is employed for cooling purposes, this being replaced by an air-jacket and a system of forced draught. The ignition is electrical, an ingenious magneto-electric device being employed, the rim of the fly-wheel being utilised to carry or form a permanent magnet, which, in revolving, produces an electrical current in a small armature geared near it. A hit-and-miss governor is fitted to the motor, and by means of small levers within convenient reach of the driver's hand the rate of sparking can be advanced or retarded as desired. The sparking plugs are arranged with an instantaneously detachable joint, and can be removed, examined and replaced in a few seconds. The electric current is conveyed to the sparking plugs by a brass bar of heavy section substantially insulated; no wire connections being employed. A special safety oil tank and carburettor is employed. The motor is fitted with automatic lubrication; a central tank is provided of sufficient capacity for 250 miles run; the oil is distributed to all parts of the motor by a system of tubes, and the supply automatically ceases when the engine is stopped. The normal speed of the motor is 800 revolutions. While all the working parts are enclosed, the covers can be readily detached. Another feature of the Lanchester car is to be found in the transmission gear. The vehicles are fitted with two gears and two brakes. The gears and brakes are actuated by two levers, which when forward drive ahead, and when backward apply the brake; in the intermediate position both are idle. The brake actuated by the low gear lever acts as a reversing gear if the application is continued after the car has come to rest. The motor drives a friction disc, against which a plate is held by depressing a lever; this plate is keyed to a shaft carrying a worm, which gears with a large worm wheel, inside which is mounted the differential gear on the rear road-wheel axle. When the worm shaft disc is pressed against the motor disc the worm rotates normally at the same speed as the motor; when the disc is drawn back it is forced against fixed stops, which act as a powerful brake. The steering is effected by a lever, fixed at the right-hand side of the car body, the wheels being mounted on independent axles, and coupled by a new design of compensating gear. The "body" is designed separately from, and is admir-

ably supported by springs on the tubular frame of, the vehicle, so that different types of body can be fitted to the same frame. The road wheels are of the suspension type, with pneumatic tires, the rear pair being provided with shoe brakes.

So large and varied is the exhibit of the Automobile Association, Limited, of Prince's Road, Holland Park Avenue, London, W., that it is difficult to know where to begin and where to end. It is simply impossible to attempt to fully describe all the vehicles on view, the brief epitome given in the catalogue alone occupying nearly six pages. We must confine ourselves, therefore, to a mere mention of the better known types, and to a brief description of the newer vehicles. Dealing first with motor-tricycles, in addition to the ordinary tricycle we find a racing tricycle fitted with a 3-h.p. De Dion motor, built with a view to cutting the records lately made by that daring motor-tricyclist Béconnais on his tricycle driven by a 4 h.p. Soncin motor. The "Orient Express" type of car is shown in two forms—one seating two and the other three persons. They are fitted with 6-h.p. motors. The ignition is magneto-electrical, the cylinders are water cooled, and the transmission is by means of belts with jockey tighteners. The "Orient Express" cars, which are of German construction, are exceedingly elegant in design, and by reason of their relatively low cost should become very popular. Three forward speeds and one reverse motion are available, belt transmission being adopted. The speeds are actuated by a jockey pulley, which is pulled down on to the belts by a lever worked by hand. The highest speed attainable on the level is 23 miles. The car is easily driven, the whole of the levers, etc., being close to hand. It is fitted with artillery wood wheels, shod with either pneumatic or solid rubber tires as desired. Prominent among a number of the now well-known 3-h.p. De Dion voiturettes is one fitted with a four-seated phaeton body. The two rows of seats—one of which is fitted with a hood—are interchangeable, so that the hooded one may be at the front and rear as desired. The steering and control levers are so mounted that the driver in all cases occupies the front seat. Several Mors vehicles are shown, including the $7\frac{1}{2}$ -h.p. dog-cart and one of the two-seated 4-h.p. "Ducs" illustrated and described in our issue of March 10th, 1899. The productions of Messrs. Ducrest, of Grenoble, France, are represented by an eight-seated "Hercules" wagonette. This car is fitted with a 10-h.p. horizontal double-cylinder motor, located in the front portion of the car. The ignition is electrical, and the cylinders are water-jacketed. The transmission is by means of belts, which normally run slack and are tightened by jockey pulleys. Three forward speeds—6, 12, and 20 miles per hour—and one backward motion are provided. The car appears to be built on sound lines, and seems likely to fulfil the requirements of anyone needing a motor-vehicle of so large a character. Quite a new car to this country is the Mors six-seated phaeton. The car is fitted with a two-cylinder vertical motor located in the fore part of the frame. It is fitted with electric ignition (similar to that in the well-known Mors dog-cart) and water jackets, and at the normal speed of 900 revolutions will indicate 10 h.p. The motor is fitted with a compression cock and a governor which operates on the exhaust valves. A special form of segmental friction clutch is introduced between the motor and the transmission mechanism. Four speeds forward and one reverse motion are provided, the maximum speed attainable being twenty-four miles per hour, the transmission being very much on the lines of that adopted in the Panhard cars. The steering is controlled by a hand wheel on which the switch for cutting off the electrical current for the ignition is mounted. A radiating coil is provided in connection with the water circulation, while there are three brakes, a feature being that the application of the hand brakes also causes the disengagement of the clutch. This car is a *fac-simile*, so far as the motor and mechanism are concerned, of the racing car, ridden by Levegh, in last year's French races, and which won the Paris-Ostend, Paris-St. Malo, and other races. Other exhibits comprise the Waverley Runabout, an electrical car of American construction, and a large range of motor-car accessories, including magneto-electric ignition devices, carburettors, batteries, etc.

The most prominent feature at the stand of the United Motor Industries, of 64, Holborn Viaduct, London, E.C., and Paris, is a four-seated Hurtu dog-cart (Fig. 3), finished in maroon and black. The car is fitted with a 5-h.p. horizontal water-jacketed motor, which drives a countershaft by belts working on fast and loose pulleys. Two speeds forward—8 and 20 miles per hour—are provided. A two-seated 5-h.p. Hurtu car is also to be seen. A neat looking voiturette is that known as the Didier. This car, which has seating accommodation for three persons, all facing forward, is propelled by a 3-h.p. water-cooled De Dion motor, suspended at the rear of a tubular frame. It drives the rear axle direct through the medium of a two-speed pinion gear. A feature of the car is the method of suspending the body. The latter is in two parts; the additional front seat is rigidly attached to the frame, while the main seat is supported thereon by plate and C springs. The car is fitted with wheel steering and two brakes, and has an attractive appearance. Of motor-cycles we find the "Empress" motor-tricycle, manufactured by the United Motor Industries, fitted with genuine De Dion 2½-h.p. motor, and Dunlop or Clipper tires, as also a Components motor-quad. There is also on view a complete range of frames, lamps, parts, and accessories, of which we may draw attention more particularly to the "D" lubricating oils for high-speed motors, sets of parts for building the frames of motor-cycles, even to the lugs and tubes to fit the same.

The principal exhibit, on this occasion, of the London Motor Van and Wagon Company, Limited, Tottenham Street, Tottenham Court Road, London, W., is a couple of "Hurlingham" voiturettes to carry two or three persons. This is the same car as was illustrated and described under the name of the "Brierre" in our issue of March

23rd last, so that a lengthy notice at the present time is unnecessary. We may mention, however, that the car is propelled by a 3½-h.p. horizontal petroleum-spirit motor, and that three speeds—6, 12, and 18 miles per hour—are available, the transmission of the power to the road axle being effected by spur gearing. The car, one of which has been entered for the 1,000-mile Trial, has a neat appearance, and seems to run very well, judging from its performance in the arena. It weighs only about 4 cwt. complete. This company also exhibit a Parisian touring phaeton fitted with 5½-h.p. Daimler motor, and a ten-seated wagonette with an engine of the same size and make, the latter being a type of car now largely used for the conveyance of the public at many seaside resorts.

The main feature of interest at the stand of the Progress Cycle Co., Limited, Foleshill, Coventry, is the new two-seated voiturette, shown unfinished so far as the body is concerned. Indeed, in the course of a chat with Mr. West, we learn that it was only by great exertion that they were able to get the car ready in time for the Show, to which it was despatched ere it had been properly tried and adjusted. So far as one can judge from its

running in the arena, the car meets all the designer's expectations, and when properly finished it will have an attractive appearance, and should soon become a very popular type on the road. The frame is of tubular construction, while to allow for uneven roads compensating coil springs are introduced in the vertical pivots on which the front axle rests. The motor is a 3-h.p. water-cooled vertical cylinder De Dion; it is located at the rear of the frame, and drives by pinions a small countershaft carrying the two-speed gear. The latter is enclosed in an oil-containing case. Through the same box runs a second small shaft carrying pinions always in mesh with those on the first shaft, either pair of which can be made to transmit the power by means of clutches. From this second shaft the power is conveyed through a small pinion to a large pinion centrally located on the rear axle. Ample brake power is provided, there being a band brake on the differential gear, and band brakes on each of the rear wheel hubs. The body is suspended by C springs at the rear; steering is controlled by a bar, on the standard of which all the various levers are mounted. The water tank is located in front of the dashboard, a radiating

coil being also fitted, the circulation being maintained by a pump. Provision is made for the starting of the motor from the driver's seat. The wheels are of the cycle type, shod with pneumatic tires. The car, which weighs complete only 5½ cwt., is geared up to a maximum speed of about 17 miles per hour. Of interest to motor-cyclists are the Progress motor tricycles and quadricycles for one or two persons. These machines are fitted with 2½-h.p. English made De Dion motors, and are of high-class finish throughout. The front-seat attachment on the two-seated quad is well suspended, and is connected by but four bolts, so that it can be quickly detached.

Other features of in-

terest in the machine are the rim brakes fitted to the rear wheels, and a saddle fitted with back rest for the rear rider. An interesting machine is the quadricycle for one rider. The advantages claimed for this machine over the ordinary motor-tricycle are numerous. In the first place the conversion to a two-seated quad is so simple that anyone can do it in ten minutes. No extra wheel is required, and no front forks, while nothing is detached except the front seat and the C springs belonging to it. The frame of the machine is not touched, and the elliptical springs underneath the front axle remain to absorb the front vibration. The machine is said to steer steadier than a tricycle, and owing to its running in two tracks instead of three, is more suitable for rough roads. Furthermore, a large basket, or portmanteau, can be attached in front, resting on the front axle in place of the seat, and with a hundred-weight of luggage in front the rider need not be inconvenienced nor the running of the machine be affected. A regular tradesman's carrier, similar to that fitted to what is now known as a carrier tricycle, can be fitted if desired, thus adapting the machine for business purposes

FIG. 3.—THE HURTU DOG-CART.

either for the delivery of parcels or, in the case of a commercial traveller, for carrying samples.

One of the many novelties at the exhibition is to be found at the stand of Messrs. S. Leuchters and Co., of 41, Aire Street, Leeds. It takes the form of a motor-tricycle fitted with a water-cooled motor. The tricycle, while of strong construction, follows the generally adopted lines. The engine is of 2½ h.p., but in future one of 3 h.p. is to be fitted. Only the cylinder is water-jacketed, the valves and combustion chamber being provided with radiating fins. The circulation is by gravity, the water being stored in two tanks supported beneath the saddle. The capacity is three pints, and this is stated to be sufficient for a run of 100 miles without it being necessary to change the water. The application of the water-jacket is claimed to have given excellent results in practice, and no doubt motor cyclists will feel inclined to inquire into the merits of the arrangement on their own account. The tricycle is arranged so that it can be fitted with a clutch to disengage the motor from the driving axle if desired. Messrs. Leuchters have also on view a Butler motor-quadracycle, which type of machine is too well known to need description at this time.

At the stand of Messrs. Farman and Co., of 25, Rue de la Paix, Paris, we find several Renault voituresses, fitted with both 2½ h.p. air-cooled and 3 h.p. water-cooled De Dion motors. These cars have been illustrated in these pages, so that a lengthy description is unnecessary at this time. Quite a new voiturette to this country is that made by Messrs. Hanzer and Co., of Petit-Ivry (Seine), for whom Messrs. Farman are sole agents. The vehicle is propelled by a water-cooled 3-h.p. De Dion motor, located under a bonnet in the fore-part of a tubular frame. Three speeds forward and one reverse motion are available, the power of the engine being transmitted by pinions to the variable speed shaft, and from the latter direct to the rear axle by a longitudinal universally-jointed shaft and bevel gearing. The car is provided with a water-cooling coil, while there is also a friction clutch by means of which the motor can be instantly cut out from the transmission. Steering is controlled by an inclined hand wheel. Three brakes are provided, one on the differential shaft and one on each of the rear wheel hubs. The car is equipped with cycle type wheels and pneumatic tires, and weighs complete about 5 cwt. The top speed is about 25 miles per hour. Messrs. Farman are also showing a Soncin motor of 4½ h.p. It is of the air-cooled single vertical cylinder type, comprising several special features to which we hope to refer to later. It was on a machine fitted with a motor of this type that the well-known motor-cyclist Béconnais made his recent wonderful performances in the way of speed. A new wheel-steering gear is also to be seen, the feature being the employment of a rack and pinion gear to transmit the movement of the hand-wheel to the steering levers. In addition there is a big display of motor-car accessories.

Since the foregoing was written a frame complete with motor and transmission gear, made by Messrs. Daniel Augé and Co., has been added to the stand of Messrs. Farman. We can only briefly refer to this addition this week. The frame, which is constructed of channel steel, carries a two-cylinder horizontal motor at its front end. The engine, which is of 5 h.p., is fitted with water jacket and electric ignition. Two speeds forward and one reverse motion are provided, the power being conveyed by a belt to a countershaft, and by pinions working in an oil-containing case. The pinions mesh with similar speed wheels on a second shaft, which at its ends carries sprocket wheels which convey the power to the rear axle by the usual chains.

A neat car is shown by the Wolseley Sheep Shearing Machine Company, Limited, of Sidney Works, Alma Street, Birmingham. It has seating capacity for two persons, but the motor is said to be powerful enough to carry four at a slightly reduced speed. The weight of the car with full equipment and tanks full, is 12 cwt. Three speeds forward—six, fourteen, and twenty-two miles an hour, and a reverse motion are available. The motor is of the horizontal single-cylinder type with water-

jacket to both the cylinder and explosion chamber, electric ignition and two fly-wheels. The power is conveyed by a single belt to a variable gear counter-shaft, which is geared by pinions to a second parallel shaft, chains and sprocket wheels conveying the power to the rear axle. All the bearings are lubricated from a sight-feed lubricator, fixed to the splash-board in front of the driver, and which carries sufficient oil for a run of about 150 miles. The steering is controlled by a lever through gearing, which is claimed to possess all the advantages of wheel-steering, being locked in every position. Two brakes are provided, these operating on a special rim secured to the side of the ordinary rim of each hind wheel, operated both by a foot pedal and a hand lever. The petrol tank has a capacity sufficient for a run of 100 miles. Only a small amount of water is carried—one gallon—this having been found to be sufficient with the Wolseley system of forced circulation, large radiating coils and the breech of the engine being exposed to the air. The car is fitted with cycle type wheels and Dunlop motor pneumatic tires.

Messrs. Friswell, Limited, of 18, Holborn Viaduct, London, E.C., have a large exhibit of motor-vehicles and motor-cycles. First we notice the two-seated Delahaye voiturette illustrated in our last issue, a Peugeot 4-h.p. voiturette, two Mors Petit Ducs, a Mors four-seated phaeton, one 8-h.p. Peugeot car which Mr. Friswell is to drive in the 1,000-Mile Trial, a Renault voiturette with 2½ h.p. air-cooler motor, a Rochet motor-tricycle with "Auto-moto" engine, and the Rochet dog-cart, all of which have been dealt with at one time or another in these pages. Messrs. Friswell have also a separate stand in the Arcade devoted to a large display of accessories for automobiles of all kinds.

The largely-used Benz motor-cars are kept well to the front by Messrs. Hewetson, Limited, of Dean Street, Oxford Street, London, W., who have nearly a dozen cars of different types on view. It is difficult to say much that is not already known of these cars. The various details have, however, been modified and strengthened as experience has shown to be necessary, the result being a neat carriage, which is well intended to maintain the already great popularity of this firm. Glancing at the cars on the stand we notice a 1900 Benz three-seated vehicle, fitted with 3-h.p. motor and three speeds, two No. 1 cars for three persons, a No. 1 Doctor's Car, a special No. 1 3-h.p. car with a body by Messrs. Mulliner, a 5-h.p. Duke Victoria with three speeds forward and reverse motion. This car has accommodation for four persons, and is fitted with wood wheels shod with solid rubber tires. Finally, we have a 9½-h.p. four-seated dogcart. This car has three speeds and reverse motion, and is capable of attaining a speed of 25 miles per hour.

The International Motor-Car Company, of 106, Great Portland Street, London W., is another concern making a very large display. In addition to a light delivery van and three or four of their well-known International cars on Benz lines to seat two and three persons, the company are showing two frames fitted with motors and transmission gear complete, which comprise several special features. It has often been complained of by exhibition visitors that the working parts of automobiles are not exposed to view, but nothing can be said against the International Company on this score. The cars are now too well known to need a lengthy description at this time, so we devote the space at our disposal to the brief mention of the new frames and motors that are now being adopted, and which bear the legend "Made in England." The first we inspected was one intended for a heavy car; it is fitted with a 10-h.p. tandem motor mounted on a channel steel frame. The motor has two cylinders, the pistons of which work on to a common crankshaft; the cranks work in an oil containing case. Three speeds, by means of belts working on fast and loose pulleys, are provided, as also a reverse motion. A new feature is the arrangement of the pedal controlling the band brakes, the belts being all shipped on to the loose pulleys on the application of the brakes. This under-frame is fitted with cycle type wheels and solid rubber tires. The motor-cylinders are water-jacketed, two cooling coils being

fitted—one at the front and one at the rear of the car. Steering is controlled by a hand-wheel, so placed that the driver may sit either on the right or left hand. Automatic lubrication is provided throughout; while another new feature is the employment of a double exhaust silencer. The car, which weighs complete about 12 cwt., has petrol and water storage capacity sufficient for a run of 120 miles. A complete four-seated car, mounted on a frame similar to that described above, is also shown. A light two-seated road racing car next attracted our attention. This is built low, and is provided with a 5-h.p. single-cylinder horizontal motor, water-cooled, two speeds, wheel steering, cycle type wheels, and pneumatic tires. Two hand brakes are provided, while a special device, permitting the chain to be rapidly adjusted, is fitted. The motor and mechanism are mounted on a channel steel frame, the weight, exclusive of the body, totalling a little over 4 cwt. It may here be mentioned that no asbestos is used in the ignition plugs on the "International" car, metallic joints only being employed. The International Company also display a frame fitted with a 5-h.p. two-cylinder tandem motor, three speeds forward and reverse motion. Altogether this is an interesting and instructive exhibit.

Mr. Dan Albone, of Biggleswade, confines his display to the "Ivel" 4-seated car (Fig. 4), which is now shown for the first time at any exhibition. As this car was fully described in our issue of December 1st last, it is only necessary to briefly allude to the leading features. One of these is the under-frame,

FIG. 4.—THE "IVEL" CAR.

which is constructed of steel tubing after the same style of that of the ordinary cycle, the arrangement of the tubes being such that the various strains to which the frame is exposed, both from the road vibration and that caused by the motor itself, are scientifically taken up, a double cantilever system being adopted. The frame is carried upon four spiral springs, those from the rear axle being contained in steel cylinders, which are raked slightly rearwards, so that the action of the springs may coincide with the lines of vibration from the wheels. The front axle springs are vertical, and are designed to allow the wheels to rise or fall to accommodate themselves to the inequalities of the roads traversed. The motor, which is of the Benz horizontal type of 3 h.p., with water jacket and electrical ignition, is located about the centre of the frame, the combustion chamber being at the rear. Two speeds forward and one reverse motion are provided, the power being transmitted by straight belts from the motor shaft to an intermediary shaft behind the rear axle, and from the intermediary to the hind road wheels by duplicate Renold "silent" chains. The "body" of the car is mounted upon four C springs, and is entirely separate from the frame and working parts. The occupants are thus completely insulated from the vibration not only of the road, but from that due to the motor. Through the floor of the car, in the centre, rises a tripod of three tubes, which carry a round fibre flat plate, upon the face of which are three small levers for the mixture, throttle-valve, and electric ignition. Upon one of the uprights are the two levers for controlling the variable speed gear. The plate is slotted, and

through it pass two long levers, one being that of the reversing gear, and the other for applying the tire brakes. This lever, when pushed forward, automatically opens a switch, thus breaking the electric circuit and so stopping the motor. The steering is controlled by means of a handle and a disc, after the manner adopted in the Benz cars, but the standard is located well on the right-hand side, the connection to the front wheel steering lever being made underneath the frame by means of a chain. Provision is made for the motor-car to be started from the driver's seat. Both water and petrol gauges are fixed in front of the driver, and everything is so placed that all the working parts can be easily got at without undue trouble. The bearings of the wheels are very large, ball bearings being employed wherever possible. The petrol tank is carried under the front seat, and contains about nine gallons, while the water tank is also large, enabling the car to run a hundred miles without a fresh supply of water being required. Four cooling tubes with large mouths pass through the tank, and as the tank is well above the motor, no pumps are required to maintain the circulation. The chains and the motor are entirely enclosed—although in the illustration the casing is removed—so that the amount of cleaning required is reduced to a minimum. The accumulators and induction coil are carried on the car in a box placed at the rear, and all the necessary tools are also provided for in this arrangement. The car is fitted with cycle-type wheels and pneumatic tires; it weighs complete about 9 cwt., and is speeded up to a maximum of from 16 to 17 miles per hour, Mr. Albone's object having been the production not of a racing car, but of a comfortable, easy-running vehicle, capable of maintaining a fair speed.

A South of England firm which is going extensively into the automobile business is Messrs. Dennis Brothers, of High Street, Guildford, who are showing several motor-cycles of their own construction. The tricycles are fitted with De Dion air-cooled motors, one of which we noted was provided with the Buchet *cylasse*, or explosion chamber. The quadricycles are propelled by 2½-h.p. De Dion motors, and, judging from the machine shown in the rough, are of sound construction. The machines are fitted with a comfortable pattern of saddle, to which a back rest is attached. A point of interest in the quadricycle is that the lever controlling the compression tap is also connected up to the exhaust valve in such a way that the latter is also opened after the compression tap is turned. The machine is convertible to a tricycle by simply removing four bolts. The "Speed King" trailer is another article worthy of notice at this stand; while of larger proportions than usual, they are very light but strong and extremely comfortable. Among the miscellaneous accessories we notice a two-speed gear for use on motor-tricycles and quads, and a 3½ h.p. petrol motor with air-cooled cylinder and water-jacketed combustion chamber.

At the stand of Messrs. Wm. H. M. Burgess, Limited, 9, Farringdon Road, London, E.C., we find a Victoria Combination voiturette, fitted with a 2½-h.p. De Dion motor, several Marot-Gardon motor-quadricycles, a "Burgess" tricycle frame, and fore carriage, all of which do not call for a lengthy description at this time. Messrs. Burgess also make a display of tanks, carburettors, etc., for tricycles and light cars.

The Automobile Manufacturing Company, Limited, of North Street, Manchester Square, had hoped to show their new Express automatic steam carriage, but which unfortunately could not be completed in time. They also expected a new 7-h.p. "Georges Richard" car from Paris, but up to the time of writing (Wednesday night) this had not put in an appearance. They display, however, a 2½-h.p. De Dion tricycle and a large array of accessories for De Dion "trikes" and Benz and Daimler cars. They also have on view a benzoline soldering lamp of a new and useful type.

We have been greatly impressed during the week with the quiet running of the New Orleans two-seated voiturette exhibited by Messrs. Burford, Van Toll and Company, of the Orleans Works, Twickenham. This is another car which has already been illustrated and described in these columns, so that but a brief description will suffice at the present time. The motor is a single cylinder one of 3½-h.p., with electric ignition, and cooled by means of a fan driven from the periphery of the

flywheel. The power from the 4in. metal pulley and motor shaft is transmitted to the countershaft by a crossed belt. On the countershaft are three wood pulleys, that on the left hand side being the fast speed, the centre the loose, and that on the right hand the slow speed pulley. The last named is carried on the countershaft and the fast speed pulley on a sleeve, upon which the loose pulley runs. The two speeds are obtained by spur and pinion gear wheels, which are always in mesh. The cars have two speeds, six and a half miles and sixteen miles, and are fitted with two brakes. The motor is securely and simply carried by six bolted brackets on a strong tubular rectangular steel frame upon which the body is mounted. The whole car weighs about 4cwt. The car, too, is fitted with a simple and ingenious method of taking up the slack of the belt by means of a lever placed conveniently in front of the driver. In addition to showing several of these cars in a complete state Messrs. Burford, Van Toll and Co. also display a frame, a specimen of the motor, and samples of the motor castings, etc.

Since the "Star" motor-car of the Star Motor Company, of Wolverhampton, was first brought to the notice of the public about a year ago it has been considerably improved, both as regards construction and design, as will be seen from an examination of the three vehicles on view. One is finished in varnished light wood, while the other two have painted bodies. They are fitted with a 3½-h.p. single-cylinder horizontal motor, two speeds, by belts, and are claimed to be capable of mounting all ordinary gradients with a full load. One of the novel features is the employment of a new form of spray-type carburettor, the claim for which is its regularity of working, obviating the employment of a mixing valve. The new carburettor is so arranged that it can be quickly detached if necessary, and its location renders the sparking plug more accessible than usual. A new device has also been adopted for the adjustment of the chains. Two of the cars are arranged to seat three persons, while one is adapted for four persons, all facing forward. We may mention that one of the cars on view has been entered for the 1,000-mile Trial. An example of the "Star" motor and countershaft with pulleys can also be seen at the stand.

Mr. C. Clifford Potier, of Sutton, Surrey, shows a De Dion 3-h.p. voiturette with unfinished body. He also displays a component 2½-h.p. motor-tricycle, and a 2½-h.p. Allard tricycle fitted with Clipper tires. In addition he makes a big display of motor-tricycle and car accessories of all kinds.

Messrs. Marshall and Co., of the Belsize Works, Clayton, Manchester, are present with a couple of their well-known

FIG. 5.—GENERAL VIEW OF RENAUX MOTOR-TRICYCLE.

Marshall cars. One takes the form of the three-seated phaeton. It is fitted with a 5-h.p. horizontal petroleum spirit motor, with electric ignition and water jacket. The circulation is maintained by a small pump, radiating coils being now fitted to all cars. Three speeds forward and reverse motion are available, the transmission being effected by belts working on fast and loose pulleys. The car shown is entered for the 1,000-mile Trial. A

neat car is the Marshall four-seated dogcart. This, with the exception of the body, is similar to the phaeton, being fitted with 5-h.p. motor, radiating coil, three speeds forward and reverse, etc. It is claimed for these cars that they can make a 200 miles trip without renewing either water or petrol. It may be interesting to mention also that Messrs. Marshall are now prepared to undertake orders for 8 and 12 h.p. racing and touring cars, with three and four cylinder engines, gear driving, inclined wheel steering, etc.

FIG. 6.—VIEW OF MOTOR ON RENAUX TRICYCLE WITH CONTROL LEVERS.

An interesting machine shown by Messrs. Marshall is the Renault motor-tricycle (Figs. 5 and 6), on one of which M. Renault won the Paris-St. Malo race last year. As we described this machine at length in our issue of August 18th last it is only necessary to briefly refer to it now. The machine differs from those of the De Dion type in that it is provided with a horizontal motor. It is stated to be capable of working up to 3½ h.p. at a normal speed of 1,200 revolutions per minute. It is located between the bottom bracket and the rear axle, its horizontal position being claimed to greatly reduce the amount of vibration experienced in motor-tricycles. There are a number of special features in the motor, one of which is that the piston rod is connected by means of a satellite pinion to two toothed wheels which form the differential. The motor is started in the usual way by the pedals, a clutch mechanism being provided to the bottom-bracket chain wheel. The ignition device and exhaust valve is controlled by a toothed wheel which gears with a pinion on the motor shaft. The toothed wheel is provided with two cams, one serving to complete the primary circuit in the induction coil at the requisite moment, and the other to lift the exhaust valve every second revolution of the motor shaft. The carburettor is located near the exhaust box, and possesses some novel features. The chain connecting the pedals with the motor bears slightly on a roller, connected with which, in the carburettor, is a miniature paddle-wheel on which falls the petrol, the latter being instantly vaporised. Altogether the Renault motor-tricycle is an interesting machine, and, as we announced some time ago, the English patent rights in it have been acquired by Messrs. Marshall and Co., who, we understand, will be able to supply in about eight weeks.

The Eadie Manufacturing Company, Limited, Redditch, exhibit several of their motor-cycles, including a tricycle, a convertible quadricycle, and a non-convertible quad. The tricycle is fitted with genuine De Dion 2½-h.p. motors, and the quads with engines of 2½ h.p. of the same make. Of any of these machines it is now hardly necessary to say much, seeing that they are being so largely used. We may mention, however, that the front seat or *avant-train* of the quadricycle is comfortably suspended on springs, and that rear axle hand brake and patent foot brake, detachable mudguards, and long distance motor saddle are provided. The Eadie Company are building a two-seated voiturette on the lines of the Renault car, and fitted with a 3-h.p. water-cooled De Dion motor. The variable speed gear is of a special type, giving three speeds and reverse. They had hoped to have the car at the exhibition, but were unable to complete it in time.

The Yorkshire Motor-Car Manufacturing Company, Limited, Hipperholme, Bradford, Yorkshire, show the Jackson car. This

is a two or four-seated car with long wheel base. It is propelled by a 4-h.p. two-cylinder horizontal petroleum-spirit motor, located in the fore part of the frame. The cylinders are water-jacketed, while the ignition can be either by incandescent tube or Simms-Bosch magneto-electrical, as desired, the car at the exhibition having tube ignition. The engine has two fly-wheels, and runs at a normal speed of 800 revolutions per minute. The cranks work in an oil-containing case, while the carburettor is the well-known Longuemare type. Three forward speeds—6, 10, and 18 miles per hour—are provided, the power being transmitted to a first counter-shaft by means of a belt, which can be tightened or slackened as desired by means of a jockey pulley, this device taking the place of a friction clutch. The pedal which actuates the jockey pulley also applies a band brake on the differential shaft. From the first counter-shaft the power is conveyed to a second shaft by two chains and one belt, any one of which can be brought in operation, according to the speed, by means of clutches controlled by a single lever. From this second countershaft chains and sprocket wheels transmit the power to the rear axle. The frame of the car is built up of channel steel, to which any type of body can be attached by means of four bolts. In addition to the car the company also show a van body which can be attached to the same frame. Steering is controlled by a hand wheel; provision is made for the starting of the motor from the driver's seat. The road wheels are of the cycle type, fitted with pneumatic tires. The water tank, which is located in the front of the car, holds 8 gallons, while the petrol tank has a capacity sufficient for a run of 60 miles. A useful provision is that for taking up any wear of the driving chains, this being effected by means of an eccentric adjustment. The car complete weighs 8½ cwt.

The Automobile Supply Company, 56, Broad Street, Birmingham, exhibit three vehicles which, while all are of an interesting character, are now all fairly well known to automobilists, and have been described in these columns. The first is a Renault two-seated voiturette with 2½ h.p. air-cooled De Dion motor, a 4-h.p. Peugeot voiturette fitted with three forward speeds and one reverse, and a convertible motor-tricycle with 2½-h.p. De Dion motor.

One of the new cars seen for the first time is the two-seated voiturette of the Wellington Motor-Car Company, Limited, 32, Victoria Road, Battersea Park, S.W. The frame is of tubular construction, the body being suspended thereon by springs. The motor is of special construction; it is of the vertical single-cylinder type with electric ignition and water circulation, and is located at the rear of the car. The cylinder is 3in. diameter by 4in. stroke. It is water-jacketed, as is the cylinder cover. These jackets are quite independent of each other, and the cover can be easily removed for inspection, the joint between the cover and cylinder head being metal to metal, no packing of any kind being used. The crank or fly-wheel chamber is in two portions, which are united by horizontal flanges bolted together. It is thus very easy to get at the main bearings and cranks. Ball bearings are used in these important parts. The inlet and exhaust valves are arranged so that either can be quickly overhauled without disturbing the other, the admission valve being placed immediately over the piston. The make and break mechanism of the electrical ignition is so arranged that no oil can possibly get on to it to so spoil the contact, as it is placed high up on the side of the cylinder, another feature being that there are no moving wires connected with the timing gear. Its weight is, exclusive of induction coil and batteries, 110 lb., the normal speed being about 1,400 revolutions per minute. The carburettor employed is of the Longuemare type. The water cooling is effected by a radiator on the front of the car, and the circulation is maintained by a small pump, driven by chain gearing. The transmission of power is effected by gearing solely, and the car is fitted with two speeds ahead and one astern, the speeds being eighteen and six miles per hour ahead and three miles astern. On the first motion shaft a patent clutch is fitted, which allows the car to be stopped without stopping the engine, and also changes the speed at will by "slippage," and a definite change of the gears. In use all the gears are running, so there is no pushing of gears into mesh whilst running, with the great liability of damaging the teeth.

The pinion on the motor shaft drives a pinion on the first motion shaft. This shaft also carries three pinions, gearing with corresponding spur wheels on a second shaft. While always in gear, the pinions run idle until any one of the pair is made to drive by means of a segmental clutch of a special design, which grips one of three rings connected with the pinions on the first motion shaft. From the second shaft, which extends across the rear of the car, the power is conveyed to the rear axle by duplicate sets of spur wheels. Two powerful brakes are fitted; one works on the balance gear box and is actuated by a foot lever, and the other works on the rims of the back wheels and is actuated by a hand lever on the right-hand side of the car. The steering is controlled by a hand-wheel. Ball bearings are fitted on all pivots connected with the steering gear, which enables wear to be taken up and so reduces the lost motion and noise of loose parts to a minimum, at the same time making the steering very sensitive and positive. The starting of the motor is effected by a special rack and pinion starting gear, by means of which, on pulling a lever near the driver's seat, the engine at once starts into motion without trouble. For purposes of inspection, repairs, etc., the car body is made so that by undoing a few bolts the entire body can be taken off. The whole of the working parts are enclosed in a dust-proof aluminium case.

Dealing first with the novelties on the stand of Mr. F. F. Wellington, 36, St. George's Square, Regent's Park Road, London, N.W., we find a new two-seated voiturette made by Messrs. Fernandez and Co., of Paris, and named the "Sirene." The feature of the car is that it is propelled by means of a two-cylinder motor of 4 h.p., the two cylinders being set at an angle to each other, and working on the same crank shaft. The motor is air-cooled, and is provided with electric ignition. Four speeds forward and reverse motion are available, the power being transmitted by a universally-jointed longitudinal shaft and bevel gearing direct to the rear axle. A clutch is provided, by means of which the motor can be cut out from the transmission gear at will. The frame is of tubular construction; steering is controlled by a hand-wheel, on the standard of which all the control levers are mounted. Two brakes are provided. The car, which weighs complete about 6 cwt., is stated to be capable of attaining a speed of thirty miles per hour on the level. The next exhibit of unusual interest is the Gladiator and Phébus motor-tricycles fitted with two 3½-h.p. Aster air-cooled motors, used by Mr. F. Wellington and Mr. Jarrott at the race meeting at the Crystal Palace on Monday last. A number of Gladiator and Phébus motor tricycles and quadricycles fitted with 2½-h.p. Aster motors are also to be seen, as also specimens of the Aster 2½ h.p. air-cooled and 3-h.p. water-cooled motors, for which Mr. Wellington is the English agent. Other exhibits comprise sparking plugs for electric ignition, tubes for incandescent tube ignition, and accessories of all kinds.

The Motor Power Company, Limited, 14, Regent Street, London, S.W., were, according to the catalogue, to exhibit an 8-h.p. Napier car, but up to Wednesday evening the vehicle had not arrived at the Agricultural Hall. At the stand we find examples of the well-known Ariel motor-tricycles and quadricycles with the

FIG. 7.—THE GLADIATOR VOITURETTE.

motor fitted inside the rear axle. Those interested in light two-seated voiturettes would do well to examine the little Gladiator car (Fig. 7) exhibited by this Company. The frame of the

car is built up of steel tubes, and is suspended on the axle by plate springs. The motive power is supplied by an Aster $3\frac{1}{2}$ -h.p. water-cooled engine located in the front part of the frame. The ignition is electrical, the carburettor is of the Longuemare type, while the water circulation is maintained by a small pump, a Loyal radiating coil being also provided. The power of the motor is transmitted to a countershaft by a chain, a friction clutch and a two-speed gear being provided. From the variable-speed countershaft a centrally-located chain transmits the power to the rear axle. Steering is controlled by an inclined hand-wheel, on which is fitted the electrical switch, while the remaining control levers are fixed on the steering standard. The car measures 6 $\frac{1}{2}$ ft. in length by 3 $\frac{3}{4}$ ft. in width, and weighs 500 lbs. Three brakes are available, while a speed of from twenty-five to thirty miles per hour is said to be attainable.

The exhibit of the De Dion-Bouton British and Colonial Syndicate, 14, Regent Street, London, S.W., is confined to a couple of the now very popular 3-h.p. De Dion three-seated voiturettes. This car, which was illustrated in the *Motor-Car Journal* last September, is now familiar to most automobilists,

FIG. 8.—PLAN OF DE DION VOITURETTE.

so that a brief description will suffice on the present occasion. The motor is of the well-known De Dion vertical type, capable of working up to 3 h.p.; the ignition is electrical, fitted with a water-jacket. A small pump is employed to maintain the circulation, the heated water being passed through a condensing coil ere it returns to the storage tank. The carburettor employed is of a new form, and is of the spraying (pulverising) type. Two speeds are provided—12 and 30 kilometres per hour—controlled by a hand wheel on the steering column. Any intermediary speed can be obtained by regulating the sparking device in the usual way. As will be seen from the plan (Fig. 8), the motor is situated at the rear of the car, and drives the rear road axle through centrally-located gear wheels, a friction clutch, controlled by a foot pedal, being provided, by means of which the motor can be instantly cut out from the transmission gear. For the rear axle Messrs. De Dion and Bouton have adopted the Cardan method of construction as used in their heavy steam cars, the axle being built up in several pieces connected by four universal joints, all vibration due to uneven roads being in this way, it is claimed, overcome. The frame of the car is constructed of steel tubing, while the road wheels are of the suspension type, of equal size, and fitted with pneumatic tires. Two hand brakes, controlled by foot pedals, are provided, one acting on the intermediate shaft and

one on the differential drum. The variable speed gear is enclosed, and works in an oil bath. The car, which weighs about 600 lb., is mounted on springs fore and aft, and is described as being a most comfortable vehicle. Another feature to which attention is drawn is that very few parts of the motor and transmission gear are visible, and that all the control gear, except of course the pedals controlling the friction clutch and band brakes, is mounted on the steering column. The makers claim that even at the high speed the car will mount gradients of from 5 to 6 per cent., and that on the low gear any hill can be negotiated.

The stand of the Motor Car Company, Limited, 168, Shaftesbury Avenue, London, W.C., has been the centre of a large crowd of spectators all the week. The exhibit is confined to a display of voiturettes, all of which are now well known in the automobile world. First we have the "Eureka" two-seated car fitted with 2 $\frac{3}{4}$ h.p. De Dion motor and weighing complete only 3 $\frac{1}{4}$ cwt. Next we have several of the Decauville 3 $\frac{1}{2}$ h.p. voiturettes, then the Renault car with 2 $\frac{1}{4}$ h.p. air-cooled De Dion, and finally the "M.C.C. Triumph" car illustrated in these columns a fortnight ago. The vehicle on the stand was driven over from Paris by Mr. Dick Farman, whose journey is referred to in another part of the present issue.

The exhibit of the Motor-Carriage Supply Company, Limited, of 17, Balderton Street, Oxford Street, London, W., is of a varied character. A German-built Daimler Universal Sporting Car occupies a prominent space on the stand. It is fitted with a 5 $\frac{1}{2}$ h.p. Daimler motor in front, with a special water-cooling arrangement and Simms-Bosch magneto-electric ignition. Four forward speeds and reverse motion are fitted, controlled by one lever. The steering gear is mounted on ball bearings, while the tires are of solid rubber. The body of the car has been built in this country by Messrs. Mulliner. The Motor-Car Supply Company also exhibit their "motor-wheel"—a three-wheel vehicle—with seating accommodation for two persons. The vehicle is fitted with a 2 $\frac{3}{4}$ h.p. Simms motor, carried under

FIG. 9.—THE SIMMS 2 $\frac{3}{4}$ -H.P. AIR-COOLED PETROL MOTOR.

and between the front wheels, which are the drivers, while the steering is effected by the rear wheel carried in a strongly-trussed back fork. The motor is carried securely below the axle, and is horizontal, the cylinder being ringed with wide wing flanges, and exposed to a full current of air when the machine is running. The motor runs at an average speed of one thousand revolutions per minute, and the gear on level ground gives the vehicle a speed of

14 miles an hour. The variations of speed are obtained by the use of Simms's magneto electrical ignition gear, which has already been described in our columns, and a two-speed gear; there is also a pedal gear for starting the motor. The machine, one of which has been entered for the 1,000-mile Trial, is arranged to be controlled by the rear rider. A big display of the Simms 2½-h.p. air, cooled vertical and horizontal and 3-h.p. water-cooled vertical petrol motors is made, all fitted with the Simms-Bosch magneto-electric ignition. The following are the most important weights and dimensions of the 2½ h.p. motors (Fig. 9):—Length (or height if vertical) over all, end of crank chamber to end of compression cock, 21 in.; width over all, end of crank shaft to end of magneto machine spindle, 14 in.; diameter of piston 71 m/m, stroke 78 m/m; compression, 60 lbs. per square inch; weight of motor complete and ready for running, including two fly-wheels of 16 lbs. each, magneto machine and timing gear, float-feed, vaporiser, cylinder, lubricator, etc., 90 lbs.

An exceedingly neat two-seated car of new design is shown for the first time by Mr. J. Burns, of 44, Berners Street, Oxford Street, London, W. The car, which closely resembles an American buggy, is propelled by means of a 3-h.p. water-cooled De Dion motor, located in the front part of the frame. The Benz type of ignition with trembling coil and accumulators has been adopted, a new departure being the control of the variable ignition by a foot pedal. The frame is of special tubular construction, there being practically two

FIG. 10.—PLAN OF DÉCHAMPS 2-SEATED VICTORIA.

frames suitably braced together, suspended by steel springs on the axles. Two speeds are provided—ten and twenty miles per hour—the power being transmitted by belts working on fast and loose pulleys to a small differential countershaft at the rear, and from the latter to the back axle by enclosed pinions centrally located. Not only is the car so arranged that the motor can, if desired, be started from the seat, but the oil from the crank case can be emptied and a fresh supply injected without the driver dismounting. Steering is effected by a tiller, the standard of which is located in front of the dash board; the road wheels are of the cycle type, with pneumatic tires, while as to brakes there is one on the countershaft and one each on the hubs of the rear wheels. The petrol tank has a capacity sufficient for a run of 100 miles. The car is fitted with a water radiating coil and weighs complete about 450 lbs. The body is spring suspended on the frame, another useful feature being the fixing of the front mudguards so that they move with the wheels. Of the Belgian-built Déchamps cars, for which Mr. Burns is agent in this country, one type is shown—a two-seated hooded Victoria. We have already published a general view of this car, and herewith give a plan (Fig. 10) showing the location of the motor and the arrangement of the transmission gear. The motor is of 4½-h.p.; it comprises two vertical cylinders, and is located in the front portion of the frame under a perforated aluminium "bonnet." Plenty of space is left between the cylinders for free circulation of the air. In addition to the "splash" lubricators the cylinders are provided with a drip lubricator for oiling the pistons. Water is dispensed with

for cooling, but, independent of the favourable position of the motor to receive the full benefit of the air and large radiating fans, a high-speed fan is worked from the flywheel by a small belt, throwing, by means of a specially shaped director, a powerful current of air completely round the cylinders. The ignition is electric, but a double trembling coil is used in place of the single contact, extra efficiency and reliability being, it is claimed, thereby obtained. The carburettor is of the Longuemare type. Three forward and three reverse speeds of 5, 9, and 16 miles an hour are provided, all controlled by one lever. The gear is enclosed in an aluminum case and runs in grease. It is composed of three pinions strongly fixed on the main shaft, which has a conical friction clutch mounted on flywheel, and a set of wheels running on the axle of the forward and backward motion which works a single central driving chain on the differential gear of the back axle. Two band brakes are fitted on the back wheels, although, except for emergencies, these are not used, as the pedal clutch tension lever further depressed puts on two band brakes on countershaft. The wheels are of the cycle type, fitted with Dunlop pneumatic tires. The weight of car complete is about 700 lbs. An extra seat for third passenger can be added if desired, and three people can, it is stated, be carried up grades of 1 in 8 with ease. When we called at Mr. Burns's stand we were informed that a two-seated Déchamps car fitted with a new type of motor was expected to reach London almost immediately. The engine is a double cylinder one of 4½ h.p., the cylinders being set at an angle to each other.

Mr. C. T. Crowden, of the Motor Works, Leamington, exhibits three vehicles, two of which have already been illustrated and described in this journal. The first is a four-wheel dog-cart, propelled by a petroleum-spirit motor, an illustration of which was given in our issue of May 5th last. It is, therefore, only necessary on the present occasion to briefly mention the details of the car, referring our readers for further particulars to the issue above mentioned. The vehicle has seating accommodation for six persons when carrying a full load, four persons facing the direction of progression and two facing towards the rear. The whole of the controlling and steering apparatus is placed on the right hand of the driver's seat. The motor is of 10 h.p. effective, and is of the twin-cylinder horizontal type. The cylinders are not provided with water cooling chambers, but the whole of their length is inserted through a large wrought copper tank in such a way that the cylinders are closely in contact with the metal of the tank, and consequently completely surrounded by an envelope of water of considerable depth. The motor is carried at the rear of the vehicle, well off the ground, and above the main frame. The fly-wheel is central with the centre of the car, and rotates in the same direction as the vehicle travels. The engine is so constructed that, at the desire of the driver, either cylinder can be shut out of action, it being claimed that one cylinder furnishes sufficient power to propel the vehicle over fair roads at ordinary speeds. Three forward speeds and one reverse motion are provided, the power from the motor-shaft being transmitted to the countershaft by belts which, normally running slack, are tightened by jockey pulleys. From the counter-shaft to the rear road wheels chain gearing transmits the power. Electric ignition is employed, current being supplied to the coil from secondary batteries. The wheels of the car are of peculiar construction. They are of the gun-carriage type, the spokes being double dished. Increased stability is ensured by the fact that in wheels of this type double the width of stock is obtained. The chain wheels, or sprockets, instead of being bolted to the spokes of the road wheel as is generally the case, are bolted to a flange provided on the wheel hub. By this means it is assured that the hub and chain will always run true with the axle, which is not the case when the sprockets are bolted to the spokes. It is also possible to employ a gear case in this arrangement, whereas this is impossible when the sprockets are bolted to the spokes. The axle boxes are made similarly to the long bolted mail-coach pattern, with a plate at the back of the collar, so that it is impossible for the wheels to come away from the axles unless they are absolutely broken up. The steering mechanism also presents some new

features, details of which will be found in our issue of May 5th last. A powerful foot brake acting on the balance wheel shaft is fitted, also a lever brake acting on the two rear wheels; in addition to which the electric current can be turned off and the cylinders made to act as an emergency brake. The car, which was brought from Leamington to the show by road, is now fitted with a water radiating coil of Mr. Crowden's own design. The second petrol car is a four-seated vis-à-vis, built on similar lines to the dog-cart, but is provided with a motor of 3 h.p. Mr. Crowden's other car exhibit is the steam brake illustrated in our issue of June 30 last. The boiler is of the multitubular type, constructed to burn coke or oil, and fitted with improved automatic stoking arrangement. The engine is of the compound type, fitted with link motion and an intercepting valve, by which high pressure steam can be used in the low pressure cylinder for starting and for climbing steep hills. The car is fitted with a foot brake acting on a drum on the differential gear shaft, and a screw lever brake acting on both hind wheels, and both of these can be actuated from the driver's seat. The counter-shaft is driven by spur wheels, while chain gearing connects the counter-shaft with the rear road wheels. A number of axles, wheels, etc., made in accordance with his designs, are also displayed by Mr. Crowden, the whole exhibit being of an interesting character.

The Endurance Motor Company, Coventry, display a smart-looking two-seated car, Fig. 11. The body of the car is entirely distinct from the frame. The motor is of 5 h.p., the ignition is electrical, while both the cylinder and combustion chamber are water-jacketed. The circulation is maintained by a pump, the

FIG. 11.—THE ENDURANCE CAR.

water tank being located in front, as is also a Clarkson cooling coil. The carburettor is of the Longuemare type. Three speeds and a reverse motor are available, the transmission being effected by two belts working on fast and loose pulleys, and Crypto gearing to the countershaft, and from the latter to the rear axle by sprocket wheels and chains. Steering is controlled by a bar, on the standard of which all the control levers are mounted. A hand lever at the side controls band brakes on drums on the rear axle, while a foot pedal actuates a brake on the countershaft. The car, which weighs complete about 12½ cwt., is fitted with cycle-type wheels and special Dunlop pneumatic tires. The vehicle was brought from Coventry to the Exhibition by road without, we are informed, it being necessary to change the cooling water. It is one of the cars which will participate in the 1000-mile Trial.

The exhibit of the McLachlan Engine Company, 14, Holborn Viaduct, London, E.C., is of an interesting character. First we have a two-seated four-wheel car fitted with a single-cylinder horizontal motor at the rear, which, working with ordinary paraffin oil, gives 3½ h.p. The ignition is by means of an incandescent tube. Two speeds are provided, the motor-shaft driving

the counter-shaft by spur-gearing connected with a double-acting clutch, while a single chain connects the counter-shaft with the rear axle. The frame is built of steel channels; the body of the car, which completely encloses the motor and gear, being of polished walnut. The road wheels are of the suspension type with pneumatic tires. Two brakes are provided—one acting on the fly-wheel of the motor, and one a band brake on the rear axle. The car is well suspended, the bearings being supported by horn cheeks and helical springs. Steering is constructed by a tiller, the speed lever being at the side of the car. The weight complete is about 7 cwt. Samples of the McLachlan 1½ h.p. air-cooled and 3½ h.p. water-cooled vertical motors are also to be seen, these being suitable for working with either petrol, paraffin, or benzolene. A 2½ h.p. motor working with ordinary paraffin oil, and suitable for a launch, is also exhibited. Amongst other exhibits are the Shrewsbury and Talbot solid rubber tire, aluminium mudguards, rims, bearings, etc. The McLachlan Company are also displaying a 2½ h.p. electromotor for launches; their electric ½ h.p. rudder motor, the "Lithanode" accumulator, sparking coils, and a small 3 ampere 8-volt dynamo for charging accumulators. Finally, we may refer to a very interesting display of castings of an aluminium alloy made by Messrs. W. Mills and Co., of Sunderland. These castings, which comprise engine beds, crank cases, etc., are exceedingly light and strong, and above all are very clean.

Messrs. Roots and Venables, of 100, Westminster Bridge Road, S.E., have on view their well-known heavy oil motor-cars. Fig. 12. They are two-seated vehicles, fitted with 3-h.p. horizontal motor using ordinary petroleum oil, in contradistinction to petroleum spirit. The cylinder is water-jacketed; the storage tanks having a sufficient capacity for oil and water for a journey of about five hours. Two speeds are provided—2 and 14 miles

FIG. 12.—PLAN OF ROOTS AND VENABLES CAR.

per hour. The countershaft is chain driven, while the connection between the countershaft and the rear road axle is also by chain gearing and friction clutches. The low-speed chain is provided with a spring jockey wheel to take up any slack, while for a similar purpose the rear axle is so arranged as to be capable of being moved on the springs. A feature of the Roots' car is the

water condensing coil, which consists of a series of copper tubes fitted round the fly-wheel in such a way that the latter works within the coil. The car weighs, complete, about 6 cwt., and is fitted with cycle-type wheels and solid rubber tires. We understand that a number of this style of car have been sold to automobilists in India, where the use of petrol is not permitted.

Mr. Carl Oppermann, of 2, Wynyatt Street, Clerkenwell, E.C., displays a very neat electrical Victoria, which is, we learn, being largely used on the Continent for service in busy towns. The battery, which consists of forty-two cells of Mr. Oppermann's own type, weighing only 24lbs. per cell, is slung by steel springs under the frame of the carriage. The capacity of the battery is stated to be sufficient for a run, in towns, of about forty-five miles. The motor, which is located in the rear portion of the vehicle, runs at 1,600 revolutions per minute; and, while its normal capacity is 3 h.p., it is capable of working up to 7 h.p. The motor is located in the rear portion of the vehicle under the passengers' seat. From the motor shaft the power is transmitted through silent hide gear wheels to an intermediary shaft, provided with a differential gear, and from the latter to the rear road wheels through sprocket wheels and chains. All the motions—starting and stopping, reversing the motor, and the application of the electrical brake—are controlled by a single handle. Three forward speeds—the maximum in the Victoria being twelve miles per hour—and one backward motion are provided. Steering is effected through the front wheels by means of a hand-wheel. In addition to the electrical brake, band brakes acting on drums on the rear wheels are provided, these brakes being controlled by a foot lever and flexible cable. The weight of the Victoria is 23cwt. Mr. Oppermann also shows a very neat three seated dog-cart, which he has named the "Lucania." The vehicle is mounted on his new tubular under-carriage, in which a new direct-driving gear, dispensing with the use of chains, is adopted. The new frame and gear is quite self-contained, and is arranged to suit a large number of different types of carriage bodies, and can be fitted up with very little labour. It is made to drive by either the front or rear axle, although the latter is preferred, as being most convenient. In the new gear the electro-motor is so arranged that instead of its shaft being parallel to the axle it is at right angles thereto. The motor shaft terminates in a worm which gears with a worm wheel centrally placed on the axle, the gear being entirely enclosed and working in an oil bath. The car is fitted with a 3 h.p. motor and a battery of forty-two accumulators, having a capacity of 150 ampere-hours. The road wheels are built on the tangent principle, with butt-ended spokes and steel hubs fitted with roller bearings. Solid rubber tires 2 in. wide are used, and the rear axle is fitted with a differential gear and runs on roller bearings. Steering is controlled by a bar acting on the front wheels. Band brakes are fitted to the rear wheels, operated by a foot lever. An electric brake, actuated by the controller, is also provided. The controller is arranged to give three speeds forwards, corresponding to 4, 8, and 12 miles per hour, and one speed backwards, all of these results being attained by means of one lever.

For the first time we have an opportunity of inspecting, at the stand of Messrs. Shippey Bros., Limited, 13, King Street, Cheapside, London, E.C., automobiles of Canadian construction. First we have quite a new design in the three-wheel "Motorette" for two persons. This carriage has been specially designed to meet the demand for a 25-mile economical "Run-about." It is described as being a good hill-climber, and is propelled by a specially wound "Still" motor of 2 h.p. The motor is geared to the front axle by two chains. The battery consists of 40 cells of a new type of accumulator known as the "New Ideal," having a capacity of 100 ampere hours. The frame is of tubular construction, steering being effected by a lever at the side acting on the single rear wheel. The controller, which is at the driver's right hand, is adapted to give four speeds forward—3, 6, 9, and 12 miles per hour—and reverse motion. The car, which is fitted with cycle-type wheels and solid rubber tires, weighs complete about 6cwt. A strange-looking car to English eyes is the "Ivanhoe" two-seated phaeton owing to the height of the body.

We understand, however, from Mr. Still, of the Canadian Motor Company of Toronto, the builders of these carriages, that it is a very popular type in Canada. It is fitted with a 4-h.p. motor geared by chains to the rear axle. The battery consists of thirty-six New Ideal cells weighing 640lb., of a capacity sufficient to run the car a distance of forty miles on one charge. The controller is adapted to give four speeds forward and reverse, the top speed being fourteen miles per hour. The car is fitted with wood wheels and solid rubber tires, and weighs complete about 14cwt. A neat-looking vehicle is the Oxford four-seated sporting dogcart. This is fitted with a 5-h.p. special differential electro-motor driving each of the rear wheels separately by chain gear. The car is furnished with a battery of forty New Ideal cells weighing 750lbs. The cells weigh about 18lbs. each, the feature being the use of an expansion plate, by means of which they are claimed to be capable of withstanding a heavy discharge rate without depreciation. The controller, which is located at the right-hand side of the car, is adapted for four speeds forward and reverse, but we understand that future cars will be fitted with a six-speed controller with non-arcing contacts. The battery will run the car a distance of forty miles on one charge, and we are informed that the vehicle has successfully mounted all the steepest hills in the neighbourhood of London. In addition Messrs. Shippey display an attractive little working model of an electrical car and a large display of electrical plant and accessories.

Headland's Patent Electric Storage Battery Company, Limited, of 12, Pall Mall, London, S.W., exhibit a couple of electric vehicles, the leading feature of both of which is the Headland accumulator, which is claimed to be constructed with a view of giving great mechanical strength, at the same time permitting of high rates of discharge and securing freedom from buckling and disintegrating of paste. The vehicles shown are a three-seated phaeton and a four-seated victoria. The phaeton is provided with a 3 h.p. motor, placed transversely in the fore part of the frame and driving the front axle through enclosed worm gearing. The battery consists of 40 cells, having a capacity of 140 ampere hours; it weighs 11 cwt. and will run a car a distance of thirty-five miles on one charge, at an average speed of fourteen miles per hour. The controller is adapted to give three speeds forward and the same backward. The wheels are of the cycle type with solid rubber tires. A side hand lever at the side controls brakes on the tire. While a foot pedal actuates a hand brake on the rear axle, the application of the latter also breaks the electric circuit. The four-seated victoria is similar to the other vehicle as regards the electric arrangement, with the exception that the motor is geared to the front road wheels by pinions engaging with internally-toothed rings bolted to the wheels. The car weighs, complete, about 28 cwt. The Headland Company also exhibit a number of their traction-type accumulators, as also electric miners' and other lamps.

That interest in light American steam carriages is fully maintained is evidenced by the attention that has been paid to the stand of the Locomobile Company of America, 52, Sussex Place, South Kensington, S.W., during the present week. The company show two of their cars which have been fully described in these columns. We may mention, however, that one of the vehicles at the exhibition is fitted with a radiating coil made up of the Clarkson wire tubes, which appears to effectually get over the trouble with the exhaust steam.

The leading exhibit on the stand of Messrs. Brown Bros., Limited, Great Eastern Street, London, E.C., is the Brown-Whitney four-seated steam-car, Fig. 13. The car has a vertical steel tubular boiler, fired with petrol, and located about the centre of the frame; the gas supply to the furnace is controlled by an automatic governor operated by the steam pressure. The boiler is fed with water by a pump worked off the engine. An injector and hand-feed pump are also supplied, so that the water can be put in under any conditions. The engine is a high pressure double-cylinder one of 8 h.p., steam jacketed, special reversing gear being used to do away with eccentrics. From the engine the power is transmitted to the rear axle by a centrally-located chain of special construction. The tubular frame consists of two parts; the lower is a rigid frame carrying the back axle, and the front swivelling and steering arrangement. The upper frame,

upon which the engine and boiler are carried, also the car body, is connected with the lower frame by springs. None of the mechanism is in any way attached to the body. The water tank is at the rear of the car, and the petrol reservoir is carried inside. A water lifter is fitted so that the tank can be filled from the roadside. Two independent brakes are provided. A sufficient quantity of water can be carried to run the car forty miles, according to the roads. The exhaust car is said to be both silent and invisible, brought about, firstly, by the steam passing through a muffle to silence it, and from thence through the downtake of the boiler, where it mixes with the warm dry air, which renders it invisible. A small portion of the exhaust steam

FIG. 13.—THE BROWN-WHITNEY STEAM-CAR.

is utilised to heat the feed-water. The speed, guiding and reversing motions are all governed by one handle. Turning the handle in one direction starts the car, the amount of movement given to the handle regulating the speed. To reverse, the handle is pulled towards the driver and turned in the same manner as when going forward. The car is fitted with cycle-type wheels and pneumatic tires; it weighs complete, with a full supply of water and petrol, about 1,000lb. In addition to the foregoing Messrs. Brown Bros. made a display of motor-tricycles, quadricycles fitted with 2½ English-made De Dion motors, front-seat attachments for tricycles, as also trailing cars, De Dion 3-h.p. water-cooled motors, motor-car chains and chain wheels, and accessories of every kind for automobilists and motor-vehicle builders.

The Thornycroft Steam Waggon Company, Limited, of Chiswick and Basingstoke, exhibit a steam covered van intended to carry a load of 3 tons, and a trailer to haul a further 2 tons, built to the order of Messrs. Harmsworth Bros., Limited. The boiler, which is of the Thornycroft water-tube type, is located in the fore part of the vehicle; it is coal or coke-fired. The engine, which is of the horizontal compound type, is entirely enclosed in a dust-tight casing, the moving parts working in an oil bath. Provision is made for the carrying of coal sufficient for a run of 50 miles, or of water sufficient for about 20 miles. Quite a number of local bodies of industrial concerns have now adopted the Thornycroft steam vehicles, they having lately been supplied to, among others, Messrs. Schweppes, Limited, the Idris Mineral Water Company, Limited, Messrs. Guinness, Messrs. Bass and Co., Messrs. Whitbread and Co., Bentley's Yorkshire Breweries, the Newcastle Breweries, and the Newcastle branch Co-operative Wholesale Society.

Foremost among the exhibits of Messrs. Adams and Co., of Lowestoft, is the Adams horizontal petroleum-spirit motor lately introduced, suitable for carriage builders, cycle manufacturers, etc., who are building small motor-cars for carrying four persons. The motor has several distinct features. The cylinder and water jacket is built up in such a way that there is no leakage of water into the cylinder, and by placing the valves and ignition

plug right over the back of the cylinder the maximum force of the explosion on the piston is obtained. The second motion is driven by a Chicago rawhide pinion, which drives an eccentric, the latter serving the double purpose of working the small circulating water pump and opening the exhaust valve. The motor cylinder has a 4½ in. bore by 4½ in. stroke, and develops three brake horse-power; a 4-h.p. size is also shown. The cylinder, piston, rings, and bearings are lubricated by the splashing of the cranks in an oil bath. The valve chambers are bolted on to the cylinder cover. The valves are very easily removed, for by unscrewing four nuts the inlet valve and seating can be lifted out. The speed of the motor can be varied from 200 to 1,200 revolutions per minute by advancing the firing of the electric ignition. Messrs. Adams also display a large range of castings, forgings, crank cases, pinions in raw hide and gun-metal, etc.

The Monarch Motor Company, of Teddington, and 39, Eastcheap, London, E.C., show samples of the Monarch petrol motor, as also a yacht's dinghy and a gunning punt fitted with the same. The motor is of the two-cycle type, the 12 h.p. one having three vertical cylinders. This motor is fitted with an improved magneto generator, which gives a constant current to the ignition. The engine is fitted with a lever and quadrant for altering the time of ignition, the three cylinders being affected by one movement, enabling the speed of the motor to be checked to a very few revolutions per minute. Fitted to the reversing gear is a lever which throttles the amount of mixture, thus regulating the speed of the motor, without the driver leaving his post. The engine is fitted with a pump on a reduced speed shaft, supplying the circulating water to the cylinders. The motor has three separate impulses per revolution, which gives a perfectly steady drive. Lubrication is amply provided for, giving the crank pin and moving parts a continuous supply of fresh lubricant; a single vaporiser is arranged to supply the three cylinders, the regulation of the mixture is effected by a single needle valve, and the supply of oil is automatically cut off when the engine stops. In addition to the 12 h.p. engine, a 4 h.p. twin-cylinder and a 1 h.p. single-cylinder engine are shown. The 14 ft. yacht's dinghy has been designed to meet the requirements of owners of yachts from 30 tons upwards. It is fitted with a 1 h.p. motor, which can be increased to 2 or 3 h.p. if required, and will comfortably go to sea in fairly rough weather, with six passengers on board. For towing purposes these dinghies can, it is claimed, handle vessels between 30 and 40 tons. The motor gunning punt is 24 ft. 6 in. length over all and the beam 4ft., its capacity being for two persons. A 1 h.p. Monarch marine motor is the engine used, this being enclosed in a wooden case lined with thick cork carpet.

A varied collection of motor parts and fittings is to be found at the stand of Mr. W. H. Dorey, 14, Rue Torricelli, Paris, including sparking plugs, carburettors, dry batteries, cooling coils, lubricators, etc. A specimen of the Auto-Moto, 2½-h.p. vertical petroleum spirit motor, the Jupiter carburettor, already illustrated in these columns, are also to be seen. Another novelty is the Stéate sparking plug, the insulating material being of steatite instead of porcelain, it being claimed that this is less liable to fracture.

Mr. F. C. Blake, of Ravenscourt Works, Hammersmith, who is well known in the automobile world for his electric ignition apparatus, shows his largely-used induction for the ignition of the charge in motors. They are fitted with large platinum contacts for continuous and heavy work, and the secondary winding is protected from damp and mechanical injury by a strong light covering from end to end. The coils give a very bright flaming spark, and are largely used by owners of motor-cars. They will work with one cell accumulator (two volts), or in some methods of making and breaking the contact two cells (four volts) are required. Dry batteries, small accumulators, sparking plugs of various types, exhaust silencers, dynamo and switchboard for charging accumulators, etc., are shown, while a new article is the Blake water-cooling coil, Fig. 14. This consists of a copper pipe to the outside of which are soldered six copper gauze pipes. This new coil is said to be giving excellent results in practice, from 2ft. 6in. to 4ft.

being sufficient to cool the water per indicated horse-power of the motor, while the weight of the $\frac{3}{4}$ in. size is only $\frac{1}{2}$ lb. per foot. Several types of petroleum-spirit motor made by Mr. Blake are also to be seen. First we have a two-cylinder horizontal engine giving 3-b.h.p., Fig. 15. It is fitted with water jacket, electrical ignition, and the cranks are set so that there is an impulse every

FIG. 14.—THE BLAKE RADIATING COIL.

revolution, and by carefully balancing, vibration is reduced to a minimum; the normal speed ranges from 700 to 800 revolutions per minute. Special attention has been given to the question of lubrication, the cranks working in an oil-containing chamber. Another engine to be seen is a two-cylinder vertical motor of

FIG. 15.—GENERAL VIEW OF BLAKE 2-CYLINDER HORIZONTAL PETROL MOTOR.

3-b.h.p., this possessing the same features as the horizontal motor, while still a further one is a 5-h.p. single cylinder horizontal motor in which the exhaust valve is located at the front end of the explosion chamber. Of special interest to motor-cyclists is the new rubber insulated wire for tricycles and quadricycles. The wire with its covering is exceedingly flexible and, it is claimed, absolutely impervious to wet and other causes of short-circuiting.

The National Gas Engine Company, Limited, of Ashton-under-Lyne and 117, Queen Victoria Street, E.C., show their "National" (improved Otto) gas engines, the types on exhibition being known as the "J," giving 2 e.h.p.; the "O," electric light engine, giving 13 e.h.p., suitable for running light, direct from dynamo; and the "R," giving 20 e.h.p. On their stand is a Turner dynamo capable of giving 250 16-candle-power lamps. Reverting to the gas engines, they are characterised by steady running and the low consumption of gas. Among the special features of these engines we notice that the lubrication of the bearings is amply provided for. Oil is supplied to the piston from a mechanical lubricator, and the stationary bearings are constructed with large oil wells and syphon wicks. There is also a patent piston pin adjustment, by which the wearing surface is much increased, and the tendency to wear correspondingly diminished. The adjustment is of a very firm and rigid character. The side shaft is of a strength sufficient to ensure the steady running to which reference has already been made, which is further facilitated by the character of the wheels employed in transmitting the motion to the governor spindle. These wheels are of the skew gear type preventing irregularities due to wear and admitting of a very strong construction. As the governor works in a vertical position the great advantages of the deadweight with the spring are secured, and any alteration in the speed of the engine that

may be required can be made without stopping the engine. The exhaust valve, seating, and spindle guide are part of the main casting, thus ensuring durability and preventing damage from overheating, as well as the fear of broken joints.

Messrs. Bilbie, Hobson, and Co., 80, Queen Victoria Street, E.C., have a gas-engine of 18 b.h.p. of their well-known "Stockport" type. Among its leading features we notice the cylinder jacket is cast with the frame, so that the cylinder is not overhung, while the strength of the engine is greatly increased. It is fitted with a separate cylinder end or combustion chamber, not only removing the risk of accident through frost, but enabling a loose liner to be used. The patent low-pressure self-starter is another special feature. A patented arrangement of the valves has also been made. There are many other features of interest on the Stockport gas-engine which can be studied by visitors. With regard to the consumption of coal gas it has been reliably ascertained that this is about $16\frac{1}{2}$ cubic feet per b.h.p. per hour under full load in the large engines, and 25 cubic feet in the smaller sizes, with gas of 16 c.p. With the large engines working in combination with fuel gas plants of approved construction a consumption of not more than 1 lb. of good anthracite coal consumed in the generator per b.h.p. per hour is working under full load is all that is necessary.

On the stand of the "Fleet" Carriage and Motor Wheel Works Company, Coventry, is the body of a two-seated car known as "The Shamrock." Up to Wednesday evening the rest of the exhibit of this company, consisting of a series of wooden wheels, had not been placed in position, but will probably be on view to-day and to-morrow.

Messrs. H. J. Mulliner and Co., 28, Brook Street, W., have nothing of particular attraction on their stand, their productions being, however, on many of the leading stands in the hall. Mr. Mulliner does the carriage work for most of the leading firms, including the Daimler Company, the Motor Carriage Supply Company, Hewetson's, De Dion Bouton Syndicate, Friswell, Limited, London Motor Van and Wagon Company, Carl Oppermann, etc. He has been closely identified with the development of the automobile industry in this country, and many of the leading cars entered for the 1,000-miles Trial have been supplied with bodies from Mr. Mulliner's works, which are admirably equipped in every detail.

An exhibit which appeals more to motor-car builders than to users of automobile vehicles is that of Messrs. Rubery and Co., of Darlaston, South Staffordshire. It comprises a motor-car body built up entirely of channel-section steel, with aluminium panels, etc.; it is adapted for a two-seated car, and weighs complete only 100 lb. The firm claim that channel-section steel affords not only a light and rigid frame, but one of great strength. Examples of the various shapes in which channel-sections can be supplied are also on view, and it only needs a few minutes' conversation with the firm's representative to ascertain the fact that Messrs. Rubery are devoting considerable attention to the matter of frames for motor-car builders. They have also on view several samples of a new lock-nut, which they have named the "Castle." The nut is of a special shape, in order to allow a split pin to be passed through slots in the nut and through a hole in the bolt. It appears to be a very effective device.

Messrs. Brampton Brothers, Limited, of Oliver Street Works, Birmingham, make a small display of their now largely-used motor-car driving chains and chain wheels. The chains are made in both solid block and roller pattern, the former in pitches from 1 in. up to $3\frac{1}{2}$ in., and the latter from 1 in. to 2 in. pitch. The products of this firm in the way of driving chains and chain wheels are too well known in the automobile world to require any lengthy description at this time, but we may mention that the firm have lately obtained a large order from the Panhard Company in Paris. A big display of chain wheels of gun metal and mild steel is made, as also an example of the Brampton chain adjuster, a device to take up any wear of motor-car chains. They are also exhibiting their "Multispiral" saddle, specially arranged for use on motor-tricycles. The claims made for this saddle are that there is no hard peak, no hard back plate, and that while lighter than usual it gives a comfortable seat.

The Mossberg Roller Bearings, Limited, of 6, Victoria Street,

Westminster, and Birmingham, have an interesting display of their bearings, for which many claims are made in the way of reducing friction, etc. The rollers are made of hardened and ground tool-steel, and, while held in a bronze cage, are free to rotate on a tool steel shell, generally fitted round the shaft or axle. A number of applications of the roller bearings are shown, including a pair of motor-car wheels fitted with Mossberg patent roller bearings, a carriage wheel similarly fitted, some axle boxes fitted with the roller bearings, the exhibition being completed with a selection of small straight and end thrust patent roller bearings.

The Clarkson and Capel Steam Car Syndicate, Limited, of Deverell Street, Great Dover Street, London, S.E., have not brought any complete cars to the show this year, but confine their exhibit to their kerosene burners and radiating condensing tubes. The kerosene burners are shown in three sizes, both vertical and horizontal patterns. The burner is of the true Bunsen type, and the quantity of air allowed to mix with the oil vapour before combustion can be adjusted to a nicety. The burner is stated to be clean and quiet and burns without smoke or smell. It can be adjusted at will to high or low flame, and can also be arranged for automatic adjustment. The burner is made in several sizes suitable for boilers up to 25 h.p. The consumption of oil is stated to be one-third gallon per horse-power hour; that is to say, a burner for a 5 h.p. boiler would consume 1 2/3rd gallons per hour. The Clarkson and Capel radiating condensing and cooling tubes are shown made up in several forms of coils for cooling the jacket water on petrol cars or for condensing the exhaust steam on steam vehicles or stationary steam plant. The tubes are constructed of light copper tube corrugated spirally. On the outside of the tube is wrapped a special coil of tinned electrical wire that is subsequently soldered for the tube. The result is a very light yet strong radiating tube, claimed to be 30 per cent. more efficient than filled tubes of same size length for length. The makers state that 4 1/2 ft. of the tube is all that is required per horse-power of the motor, and that one foot of the 1 5/8 in. diameter tube will condense 10oz. of steam per hour, this quantity being estimated with the car running at a speed of eight miles per hour. The tube is made in several sizes ranging from 1 5/8 in. to 3 in. diameter.

A very ingenious variable speed gear is that shown by Mr. L. Rottenburg, of the Patella Works, Paisley. The gear consists of two automatic expansible belt pulleys connected by a belt. The driving pulley remains at its largest diameter until the motor-torque reaches a predetermined maximum, which can be regulated to suit the output of the motor, when it automatically reduces its diameter, while the driven pulley expands in such a manner that the motor-torque remains practically constant. The pulleys are of special construction, the outer drum being carried by a series of lattice-like arms, one series of which is attached to a fixed drum, and one to a hub free to move on the shaft, suitable adjustable springs being enclosed in the hub. The two pulleys are in the ratio of 1 to 3.3 to each other. The inventor claims that a motor-car equipped with a gear of this type would automatically vary its speed so that the motor would always be running at the load at which it was most efficient; on the level it would run at its highest gear, while the ratio of reduction would change to suit a gradient requiring a draw-bar pull up to 3.3 times that required for the level.

Friction clutches are a necessary adjunct to most motor-cars, so that the display made by the Champion Friction Clutch Company, Limited, of 10, Parade Chambers and High Street, Sheffield, is not without interest to automobilists. The clutch is made in a variety of forms and sizes. The friction is put on and maintained by spiral springs, which are said to operate on the frictional surfaces so as to prevent end thrust; while at the same time all the advantages of an unbroken conical ring are retained. While disconnected the frictional surfaces are entirely free from contact. The striking gear is designed to prevent collar friction, so that the clutch does not brake the shaft either when driving or stopped. The clutch comprises an

inner and outer cone, both of metal. The springs referred to are held between a flange on the inner cone and a flanged sleeve on which the inner cone slides. At the stand various types of

FIG. 16.—THE CHAMPION DOUBLE CLUTCH.

clutches are shown, viz., a double clutch operated by one lever, and capable of transmitting $\frac{1}{3}$ reg. h.p. per 100 revs of the driving shaft (Fig. 16), a clutch ready to connect up to the fly wheel and a motor of a capacity of 1 h.p. per 100 revs of the driving

FIG. 17.—THREE CHAMPION CLUTCHES ON ONE SHAFT.

shaft, a clutch combined with a five-step cone pulley and a set of three clutches on one shaft suitable for two speeds forward and a reverse motion (Fig. 17). We may add that these clutches have already been supplied to several motor-car builders, both in this country and on the Continent.

Accumulators or second batteries for lighting and traction work form the speciality of the Hart Accumulator Company, Limited, Marshgate Lane, Stratford. The feature of the cell is the employment of a special grid, formed in such a way that it is claimed that the active material cannot be disintegrated. Another point is the use of special bolted terminals, which are claimed to be able to work satisfactorily without cleaning for about six years. The lighting cells are made in sizes ranging from 110 to 880 ampère-hours, and the traction cells from 50 to 280 ampère-hours capacity. The 150 ampère-hour size has a 24-ampère discharge rate for five and a half hours, the weight per cell, including the acid, being 45 lbs. Lightness and durability are two of the special advantages claimed for the Hart accumulator.

Accumulators or secondary batteries for spark ignition on motor-tricycles and cars form the leading speciality of Messrs. Peto and Radford, Limited, 28, Victoria Street, London, S.W. The batteries give a flaming spark of great capacity; they are made in several sizes, ranging from 4 ampère-hour capacity up to 50 ampère-hours. The tricycle size has, it is stated, a capacity sufficient for a run of 500 miles, after which they can be recharged at a small cost. The accumulator consists of an ebonite box divided into two compartments. Each compartment is fitted with positive and negative plates, separated by ebonite rods. In addition to being used for ignition work the batteries are so arranged that a small portable electric lamp may be connected up to them in case of emergency. Other exhibits on the stand comprise electric lamps suitable for motor-cars,

The Meyra Electric Company, 75, Newman Street, London, W.C., have a large display of the "Meyra" dry batteries for use in connection with the electric ignition of the explosive charge in petroleum-spirit motors, either on tricycles or cars. Full particulars of these batteries were given in our last issue. The Meyra Company are also showing an electrical clock in leather case suitable for attachment to motor-vehicles. The advantage of these clocks is that no winding is required, they being worked by one small "Meyra" dry battery, which will run the clock for about two years.

Le Carbone (late Lacombe and Cie), of Levallois-Perret, Paris, and 36, Lime Street, London, E.C., have an interesting display of electric accessories for use in connection with motor-carriages. Chief among them may be mentioned the "Sans-pariel" dry battery for use with the ignition apparatus of petroleum-spirit motors on carriages, yachts, tricycles, bicycles, etc. It is claimed for these cells that they give the maximum output for the minimum of weight and dimensions. The cells offered for tricycles, with suitable coils, will last between 300 and 500 working hours, according to the conditions in which they are employed. A specially light set of batteries for use on racing tricycles is now being marketed by this concern. The batteries are made up in sets of five, and are much lighter than usual. Another new departure is the manufacture of light batteries to be carried by motor-cyclists as a reserve, in case the ordinary battery should run out. Le Carbone Company also makes a speciality of carbon brushes.

As might be expected the Dunlop Pneumatic Tire Company, Limited, of London and Coventry, make a representative show of their tires—from light patterns for motor-tricycles to large tires for heavy cars. A tire occupying a central position on the stand is that made under the Bartlett patents. This is specially intended for heavy cars, and the sizes and thicknesses exhibited are similar to those employed on the famous French racing cars. Samples of two kinds of wheels made for motor-cars and voiturettes respectively are also shown. In this work the company has been very successful. To the ends of the spokes metal sockets are fitted. These are then attached direct to the steel rim, thus dispensing with wooden felloes. The completed wheel is strong, light, and neat, and eminently serviceable for automobiles.

A new tire designed for use on motor-vehicles is shown for the first time. Although this is quite a new introduction by the Radax Pneumatic Tire Company, Limited, 51, Fountain Street, Manchester, and 32, Bread Street, London, E.C., we understand it has been fully tested, and has given very satisfactory results. The "Radax" tire possesses a patent canvas, so woven that the sides of the outer cover fit closely in the rim, and form a sound principle of attachment. Being woven in a circle it is possible to secure the threads being small at the edges or smallest circumference of the tire, and to gradually increase in size as the circumference becomes larger. Thus the tire is made to perfectly fit the rim and so obviate any possibility of rolling friction. There is thus no wires, hooks, bands, or thick edges in connection with the "Radax" tire. Whilst in use it cannot be forced from the rim—even if it is punctured or but slightly inflated. Despite its tenacity when in actual service, there is no difficulty in connection with taking the tire off or putting it on, while the fact that it is made to fit all kinds of rims now in use should lead to its adoption by many who have not yet found a tire to their liking.

The North British Rubber Company, Limited, Castle Mills, Edinburgh, are present with a display of their well-known solid rubber tires for motor-tricycles and light and heavy motor-vehicles, and also Clincher pneumatic tires for motor-cycles. This company also show their pneumatic tire of the Clincher type, suitable for light motor-cars, several specimens of which are to be seen at the stand.

The Collier Twin Tire Company, Limited, of St. Albans, exhibit a tire for motor-vehicles. It consists of a combination of the pneumatic and solid tires, the pneumatic being between the wheel and the solid rubber, but both the pneumatic tube and the solid rubber tire are contained in one piece of fabric, or outer cover, by which great strength and

durability is stated to be obtained. The advantages claimed for the tire are freedom from puncture, as the pneumatic tube is kept well off the ground, and narrow tread, the twin tire being deep without being broad. These tires have been specially designed for automobiles, and have been designated "twin tires" because the resilient solid rubber and an "air-tube" are enclosed in the one cover. The "fastening" of these tires enables them to hold securely to any flanged rim, while they are also easily adjustable by the user.

One of the concerns which are now catering for the demand for pneumatic tires for automobile vehicles is the Clipper Pneumatic Tyre Company, Limited, of Aston Cross, Birmingham. The "Clipper" tire, which is being made in several sizes, suitable for motor-tricycles and all types of motor-cars, is not held on the rims by means of wires, the latter being replaced by the thickened edges with which the outer covers are provided, the tires being further attached to the rims by means of bolts. The tires shown are of all diameters and in all sizes, from 2½ in. to 5 in., one speciality being a racing car tire of 120 m.m. diameter. In addition to tires the Clipper Pneumatic Tire Company, Limited, have a large selection of inflators, valves, repair outfits, and carriage jacks.

An exhibit of their Grappler tires for motor-tricycles, motor-quadracycles, heavy and light motor-cars is made by the New Grappler Pneumatic Tire Company, Limited, 27 and 28, Clare Street, Dublin, Birmingham, and London. They also show the Grappler attachment to fit Michelin pattern rims. One of the advantages claimed for this tire is that it can be repaired in case of accident, being hand-built and not vulcanised and made harsh. It is built "to shape," and when inflated the cover and tube are normal, and not distorted. The tire will stand a great air pressure, and it is said to be impossible to blow it off the rim.

Messrs. J. W. and T. Connolly, of 65, Wharfedale Road, King's Cross, N., have a good collection of wheels fitted with their "Ideal" rubber tires. These can be fitted to all existing rims, and have been supplied to some of the leading motor-car firms with great success. The tires are held on the rim by means of two electrically-welded wires in such a way that it is claimed that the tires cannot come off the rims or creep. The tires are now being made in sizes up to 2½ in., suitable for cars of a total load, with passengers, of two tons. Samples of the tires are shown fitted to both wood and steel wire-spoked wheels. At this stand, too, are the Grant roller bearings. These revolve on tapered rolls, and are calculated to lessen the pull nearly 40 per cent. The adjusting nut is so constructed that the slightest wear can be taken up instantaneously, and as the carrying capacity of the rolls is considerably greater than the bed of the axle there is no danger of the rolls being crushed or broken. The cones are loose on the spindle, so that they can turn independently of the rolls. An unusual jolt causes the cones to turn and so brings another part to the bearing point. The necessary wear is thus distributed all over the surface, instead of upon a single point, as is the case when the cone is keyed to the spindle.

The feature of the solid rubber vehicle tire exhibited by the Sirdar Rubber Company, Limited, of 36, Duke Street, London, E.C., is that it consists of an endless compressed band moulded in a coil form, so that the tendency of the tire is to hold itself on the rim without the use of wires. A light strip of fabric is embedded in the base of the tire to prevent stretching. Another feature claimed for this tire is that it is put on the rim under compression, so that any slight cuts on the tire automatically close up. The "Irel" tires for motor-cars are a cheaper make which are compressed but not endless. On this stand will be found a wheel fitted with the company's tire that has withstood eighteen months' wear very successfully.

Very complete, so far as the motorist's personal equipment is concerned, is the stand occupied by the well-known firm of A. W. Gamage, Limited, of Holborn, which shows some fashionable designs in motor clothing, including black and brown leather suits, overcoats, riding breeches, etc. Among the novelties is a tweed coat of the latest pattern with sanitary wool fittings and deer-skin lining. For those who prefer a more expensive coat there is a jacket of French kid, which has a remarkably good appearance, and should become popular among Society votaries.

of the motor-car. In addition to a very complete selection of clothing for automobilists, there is a capital display of motor caps, gloves, and leggings, while several specialties in gauntlets seem to attract general attention. Gamage's are making a feature of motor caps, and these, with a collection of motor accessories, such as motor horns, lamps, etc., complete the display. During the week an attendant has been busy taking measurements for special suits.

Some very useful motor-car accessories are to be found at the stand of Mr. Alfred Dunhill, of 145, Euston Road, N.W., in the way of rubber mats, rugs, and gloves, all necessary articles, especially now that the touring season is upon us. Mr. Dunhill's products in this direction are now too well known in the automobile world to need any lengthy mention at this time, but we may add that he is also making a speciality of outfits for the repair of punctured pneumatic tires of motor cycles and cars. The repair of a tire on the roadside is anything but a pleasant task, but it is better to be equipped for emergencies than to be stranded on the roadside, miles from a railway station. Gauntlet gloves are another speciality, and he has also a large collection of rubber mats of excellent quality and appearance. Among the mats we specially noticed those made from Imperial fibre, which are having good sale. Some capital water and dust-proof covers for motor-cars are also to be seen on this stand.

The "Autocoat" was shown by Messrs. Hoare and Sons, of High Holborn, and attracted considerable attention. This is made of a rain-proof cloth and lined with all wool material and interlined with "antiletheret"—a speciality of the firm's, which is said to be absolutely wind and rain proof. Across the back and sleeves a yoke is giving ensured extra warmth, and the style of buttoning secures ample protection for the chest, while the provision of wind-proof cuffs and special map pockets show that no detail has been omitted in the endeavour to provide a really serviceable coat.

Messrs. Carless, Capel and Leonard, of Hope Chemical Works, Hackney Wick, N.E., are present with an exhibit of their well-known petrol for petroleum-spirit motors, also samples of petroleum oils for lighting and heating, etc., and lubricating oils of all kinds. Included among the latter are lubricating oils specially adapted for petrol cars, while the petroleum oils include those of the "Lighthouse," "Pilot," and "Phœbus" brands. There is also a good collection of petrol storage tanks. One of the novelties at this stand is a patent benzine safety lamp suitable for lighting motor-car houses, or for use in any buildings where inflammable materials are stored. The lamp is constructed on the principle of the Davey safety lamp, which is the interposition of a fine wire gauze between the internal flame and the external atmosphere, the action of the wire gauze being to radiate or dissipate any heat from the flame, and so reducing the temperature much below that necessary for the firing of an explosive mixture of air and petrol vapour. The lamp consists of a double wick raised and lowered from below, and it is ignited by the flame produced by striking a portion of prepared cotton which is carried in a small metal box; the lamp can thus be lit without opening it to the outside air—a very great advantage.

The Anglo-American Oil Company, Limited, of 22, Billiter Street, London, E.C., are present with an exhibit of their well-known petrol for petroleum-spirit motors, together with a number of petrol storage tanks, barrels, etc. The company has lately made a new departure in putting up their spirit in small-sized and air-tight cans, which greatly simplifies the question of storage, and also enables owners of motor-cars to conveniently carry a supply of spirit whilst on tour. Their cans of two-gallon capacity are of useful shape, and facility in transit is secured by cases holding four cans. The company is bringing out an excellent cabinet with a capacity of twenty gallons. To this is fitted a pump with a sink, so that the oil can be pumped from the cabinet, and any overflow runs back again into the cabinet, which is provided with a lid, and is absolutely air-tight.

Lubricants for motor-cars form the feature of the display made by Messrs. Stern Bros., 57, Gracechurch Street, E.C. Among the specialties shown are Sternoline lubricant for the bearings, Fram lubricant for the axles, Sternoline motor-car oil, Sternoline cylinder oil, Sternoline rust preventative, Sternoline

elastic paste for gearing, cog wheels, chains, etc. This latter must be applied in a liquid state to chains and cogs. It cools rapidly, and forms a strong, smooth surface which neither comes off nor blisters. The makers claim that the use of this elastic paste diminishes wear and avoids all direct friction. Dust will not mix with it, so that the cogs are kept perfectly clean, and although quite dry in appearance they are well lubricated. As the paste is entirely free from acids and all impurities, its elasticity is easily preserved and it will not harden. Another speciality at this stand is Stern's adhesive belting brick, which are made in a very compact and handy form, and are very clean. They prevent the belts from slipping or coming off the pulleys, keeping them pliable and counteracting the looseness produced by stretching.

"Motorine" forms one of the exhibits of greatest interest to motorists at the stand of Price's Patent Candle Company, Ltd., Belmont Works, Battersea, S.W. The grade known as A is particularly suitable for use in the largest motor-cylinders. It possesses a very high volatilising point and is being used with success in air-cooled non-jacketed motor-cylinders. The B grade is a thinner kind of the same oil in which the body at higher temperatures and flashing point has been partly sacrificed to secure increased fluidity at normal temperature. This oil is specially adapted for small motor-vehicles.

A good lamp is one of the prime necessities in connection with motor-cars, and visitors to the exhibition should not omit to inspect the stand of Messrs. Salisbury and Son, of Green Street, Blackfriars, S.E., who make a special feature of light-giving articles. The firm are the British agents for the Dietz paraffin lamps, and are showing samples of the improved patterns for 1900. For those who prefer an acetylene lamp the firm are introducing a novelty in an acetylene candle, which will fit into an ordinary carriage lamp. Among other exhibits are the automobile new model motor-car lamp, the Salisbury motor-cycle lamp, the Invincible motor-cycle lamp, the Sun Ray acetylene motor-cycle lamp, and an acetylene generator attachment for motor lamps.

A new water-cooling coil forms the exhibit of M. P. Apprin, of 27, Rue de l'Abondance, Lyons, France. As this new coil was illustrated in a recent issue of the *Journal*, it is only necessary to state that the special feature is that the fins are hollow and are part and parcel of the tube, they being manufactured by a special process. The coils weigh about 2lb. per metre, while one metre is said to be sufficient per horse-power of the motor.

The Whippet Cycle Syndicate, Limited, of 281, Oxford Street, W., exhibit an Ariel motor-tricycle fitted to the Whippet single-wheel trailer. Readers are referred for particulars of this to the description we recently published in these columns.

Of importance to those concerned with the organisation of great industrial works, is the display of time recorders made by the British Bundy Company, Limited, 81, Southwark Street, E.C. This consists of ingenious devices for automatically and reliably recording the time of workmen. These have already been adopted by many of the great engineering firms, etc. In the Bundy system each employé is given a numbered key, and upon arrival in the morning, whenever he goes out and returns during the day, and upon leaving at night, he registers the time and his number by inserting the key in the proper place in the recorder and giving it a quarter turn. In registering when going out, the lever at the end of the clock is held down, thereby printing a star opposite the number, showing departing time. A printed impression is thus made on the paper ribbon inside the clock, of the hour and minute that each employé registers, together with his number. This record (which is only accessible to the person having the key which opens the clock) may be taken out every night, or as often as desired, and from it the actual time of service of every employé noted on the time book, and credit given accordingly.

Of general interest to commercial men is the exhibit of the Remington Sholes Syndicate, Limited, 100c, Queen Victoria Street, E.C., which consists of roll-top desks, office chairs, etc., the special feature being the exemplifications of the Wabash expansion business systems, letter filing cabinets, card index, cabinets, etc. We were informed that the company has done

splendid business at the exhibition, much interest having been shown in the ingenuity of the idea of sectional divisions, which is at the basis of this well-ordered plan. The "Remsho" type-writer is also on view here the main feature being one that should appeal to all automobilists, viz. for the one frame two carriages are provided for the papers of legal and brief sizes respectively.

Messrs. John Hall and Sons, 76-77, High Street, Marylebone, W., and at Bristol, have a case containing aniline dyes extracted from coal tar, earth colours, powdered and levigated, chemical colours, gums used in varnish making, etc. This firm is giving special attention to paints, colours, and varnishes for motor-car builders, their leading lines being in crimson, pale drop carmine, black, in turps and carriage varnishes.

Messrs. Lane and Fitte, 331, Kennington Road, S.E., make an effective display of their well known "Nugget" waterproof black and brown polishes for boots and shoes, as well as enamel polishes for motor-cycles, etc.

A goodly assortment of trucks for various trading purposes is shown by Mr. H. C. Slingsby, 30, Gray's Inn Road, W.C., the specialities including trucks with rubber tyres, and others filled with patent docking gear.

Messrs. Curzon, Robey, and Co., Limited, 7, Newman Street, W., have some excellent specimens of photography, lithography, and printing for the motor-car trade, to which the firm is specially applying itself. Not only have they been very successful with outdoor work, but their photographs of interiors are distinctly good.

Publications of interest to motorists and cyclists are shown at the stands of Messrs. Cordingley and Co., where the *Motor-Car Journal* has been in good demand all the week: of Messrs. Iliffe, Sons and Sturmev, Limited, where road maps and books for motorists form a conspicuous feature on the stand and of *Cycling*, where some of the original drawings for our contemporary are to be seen.

EXHIBITION ECHOES.

The Press and the Exhibition.

DESPITE the demands on the space of the daily papers by reason of the war news and the usual seasonable attractions, the Motor-Car Exhibition has secured favourable and extended reports in the leading journals. Very noticeable is the change in the attitude adopted by the representatives of the general press towards automobilism, and few of the disparaging comments of a few years ago have been given publicity during the past week. Journalists recognise the improvements that have taken place in design, and have not been slow to notice the absence of smell with the great majority of the cars. Even those that do emit a slight perfume do so in a very undecided fashion. All these matters have been duly chronicled, and must help to direct public opinion into a favourable channel. Not only did the great London dailies send representatives on the opening day, but correspondents were present on behalf of the provincial press, while many who write for technical journals were also to be seen. In addition to English journalists, several representing French and other Continental journals were in attendance, and the interest displayed by the whole newspaper world has been greater than on any previous occasion.

Doctors at the Show.

THERE have been many professional men at the exhibition, and one of the journalists pointed out several legal luminaries. Not only have the lawyers shown an interest in the exhibition—Sir Francis Jeune and Sir Richard Webster, Q.C., are both keenly interested in automobilism—but doctors have been lavish in the hours they have given to the stands. More perhaps than any other professional class medical men have a practical interest in mechanical means of locomotion, for not only will the possession of a motor-vehicle enable them to dispense with two or even three horses, but it will also take the place of

two or three vehicles—owing to the possibility of having two different bodies to be affixed to one frame. These are points which appeal strongly to those to whom the saving of time is also a consideration; hence the large attendance of doctors, which has been one feature of exhibition week.

Khaki.

ON Tuesday several well-known military men were among the visitors, and at one time there were a soldier and a sailor on cars travelling round the arena. This has not been the only evidence of the military spirit interested in motor-vehicles, for on the evening of Easter Monday some sensation was caused by the advent of a Parisian Daimler car painted a khaki hue. On the opening day one driver of a privately owned vehicle wore a khaki suit with cap to match. During the past day or two a khaki-painted quadricycle has attracted attention on the stand of the Motor Manufacturing Co.

From Paris to London on a Renault Car.

ONE of the vehicles which has attracted considerable attention during the week is the Renault 3 h.p. water-cooled car. The cause of the attention devoted to it arises from the fact that Mr. Dick Farman, accompanied by his brother, journeyed on it from Paris to London by road, with the exception of course of the cross-channel voyage on the steamer. The car, which is being introduced in this country as the "M.C.C. Triumph," was illustrated in these columns a fortnight ago; it is, therefore, only necessary to mention that it is propelled by a 3 h.p. water-cooled De Dion motor, and has seating accommodation for three persons. Messrs. Farman left Paris at 4 p.m. on Good Friday. Dieppe was safely reached the same evening in time to catch the night boat to Newhaven. The latter place was left at 7.30 a.m. on Saturday, the Agricultural Hall being reached at 10.30 a.m., and the whole of the 200 miles (including the boat journey) being covered in eleven hours. A strong head wind was encountered throughout the whole distance. Naturally, Messrs. Farman are not a little proud of their achievement, which speaks well for the capabilities of the Renault car.

The Yard.

THROUGHOUT the week the entrance from Barford Street has been a centre of interest, the entry of cars being made the occasion for groups of exhibitors and their friends gathering to discuss the merits of various vehicles. There is hardly a building in the country so well adapted for an exhibition of this character as the Agricultural Hall. Not only is the spacious arena under cover, but at the entrance is an open courtway, as well as a large covered-in area, where the cars can be overhauled should the weather be disposed to rain. This is an advantage well appreciated by the many motorists who have driven to the Hall. It would be impossible to chronicle all the incidents that have occurred during the week in this busy space, but it can be claimed to have had a great educational influence on the carriers' horses which have been drawn up in the yard. With cars vibrating and buzzing all around, the great majority have calmly resigned themselves to the shafts, while the few that seemed curious quickly got over their first feeling of consternation, and proved as well-behaved in the presence of a score of motor-cars as they would have done in the most commonplace horse show. One noticeable feature in connection with this subject must be recorded, viz., the good behaviour of Islington horses generally—probably the result of their familiarity with motor-cars during the recent automobile exhibitions in their neighbourhood.

Few Mishaps.

THIS year's exhibition has, so far, been wonderfully free from mishaps—a satisfactory state of things due to the uniform courtesy which has prevailed in the arena no less than to the reliable character of the vehicles exhibited. There have been no collisions and, up to the time of writing, only one vehicle has been

overturned, and this without any serious result. This mishap was really due to no fault of the victim, but was owing to the backing of another vehicle out of its circle. This freedom from accidents, which has been a characteristic of the motor-car exhibitions, is a further tribute to the safety attained by motor-vehicles.

A Lady Motorist.

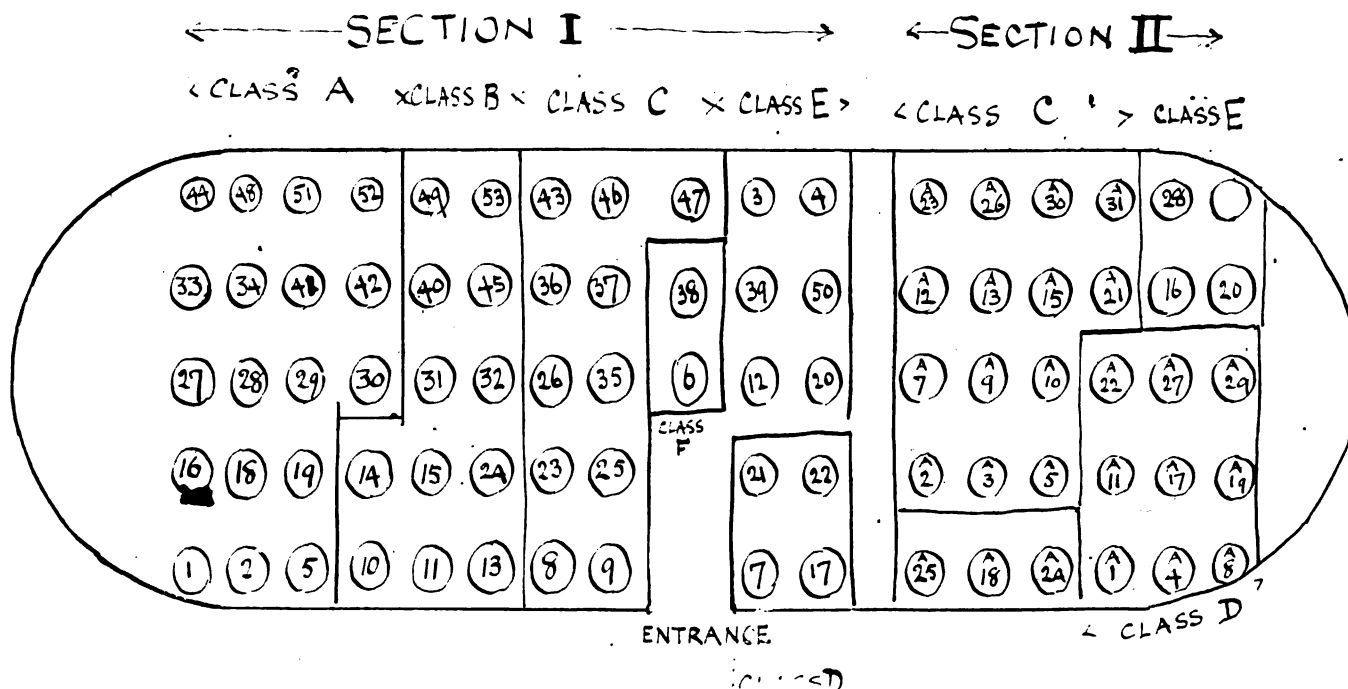

LADIES have been among the most eager applicants for seats on the vehicles running around the arena, but none have ventured to drive. Visitors on Tuesday afternoon, however, had an opportunity of seeing Miss Bacon motoring, pedalling, and walking round the arena. As announced last week, this lady motorist has purchased a Werner motor-bicycle, and her arrival at the Hall on her machine created much interest. Unfortunately she was not able to demonstrate her full powers over her new possession owing to its stubbornness. Various reasons were assigned as the cause, Miss Bacon herself attributing it to her remissness in not attending to it properly after a run from Cookham on the previous day. We hope better luck will attend her should she venture on the 1,000 miles Trial course.

The Arena on Saturday.

THE arena at the Agricultural Hall on Saturday should present a very attractive appearance, as all the vehicles entered for the 1000-Mile Trial will be drawn up for examination by the judges. The vehicles will face the long side of the arena in which is the entrance, and they are expected to take up their allotted positions (as shown on the rough plan given below) not later than 10.30 a.m. They will not be removed before 9 p.m. Every vehicle will bear its number plate on both the front and back. The display will certainly be a most representative one, the inspection of which should prove one of the most useful sights of the whole exhibition.

Photographs.

DURING the week Messrs. Curzon, Robey and Company, Ltd., the official photographers to the exhibition, have been very busily engaged, and some extremely effective photographs have been secured. The light was not very satisfactory on the Tuesday, but on Wednesday a good group was taken in the

PLAN OF THE AGRICULTURAL HALL ARENA.—SHOWING POSITION 1,000-MILE CARS ARE TO TAKE TO-MORROW (SATURDAY).

Expert and Instructor.

AMONG the familiar faces seen at the exhibition during the week has been that of Mr. Oliver Stanton, who has many pupils in connection with automobilism, and as an motor-car instructor is attaining distinction. Among those who intend taking instruction from him in motoring are Sir Richard Bulkeley, Sir Gilbert East, and Colonel Stewart-Mackenzie. As the interest of society in motoring develops he will find increasing demands upon his time, and there is little doubt that his experience will prove useful to many an aspiring automobilist.

Public Service Vehicles.

ONE of the notable features of the exhibition is the presence of several vehicles intended for public services. One is for the Edinburgh Autocar Company, which has more than thirty similar wagonettes, each seating eleven passengers, in use in the Scottish capital. On another stand is a vehicle for a service at Merthyr Tydvil, and on Tuesday the wagonette of the Thames Valley Motor-Car Company, which is intended to serve some of the pleasant places in the valley of the Thames put in an appearance.

arena, several of the principal cars and many of the best known exhibitors being included therein.

Wednesday's Dinner.

THE dinner on Wednesday evening was a very enjoyable affair, nearly one hundred and fifty practical automobilists participating therein. These included owners, manufacturers, and drivers of cars which are taking part in the forthcoming great tour, and after permission had been given to smoke, conversation turned on little else than the prospects of the future few weeks. Mr. Mark Mayhew, L.C.C. who has two cars entered in the Trial, was in the chair, and after the usual loyal toasts had been heartily honoured, proposed success to the 1000-Mile Trial. He said that those present had many matters in common, and especially were they agreed upon the question of automobilism. All present had a certain amount of experience, and he thought it would not be out of place to say that as their experience increased so did their enthusiasm grow. They hoped the long drive about to be commenced would be a great success. They were in possession of a peculiar joy and knowledge, and they wanted to proclaim to the rest of the world what real pleasure there was in automobilism, and to show that

it was a reasonable, efficient, and delightful means of locomotion, in which everyone who could pay for a car could join as soon as he found one to his taste. The result of the tour would be to increase the popularity of the sport with English people. The Hon. C. S. Rolls then read the paper on the latest arrangements, which is reproduced on another page. At its conclusion a hearty vote of thanks was accorded to Mr. Rolls on the motion of Mr. Roger Wallace, Q.C., seconded by Mr. Friswell.

**Courtesy as
a Means of
Grace.**

In proposing this vote of thanks, Mr. Wallace related how he had converted the squire of his village to automobilism by one of those simple acts of courtesy which should be shown by all automobilists. It appears he was riding a De Dion motor-tricycle through the village, and on ascending a hill saw a person in a carriage descending. He held up his hand for him to stop, and although it was at the risk of having to descend the hill again, he did so. On the vehicle passing he found it had two occupants, one of whom was the squire, who was full of prejudice against automobilism. Later he was heard to say that he would regard motor-vehicles with more friendliness if all motorists would act in a similar way. Mr. Rolls also emphasised the point, and Mr. Johnson's experience confirmed it. In these early days of the industry, every courtesy must be shown to those on the highway.

**The Vallée
Racing
Car.**

ON Wednesday afternoon Dr. Lehweß and Mr. Gregson—the former fully protected with goggles—visited the hall and went for a trip on the Vallée racing-car, illustrated in our columns a few months ago. The car naturally attracted considerable interest and was keenly scrutinised by the many experts present.

Mr. E. J. Coles.

As the week has progressed the performance of Mr. E. J. Coles, the motor expert, has developed in public interest, and has demonstrated the great control that an experienced driver can obtain over his car. After a series of skilful evolutions between dummies ranged along the arena he leaves the car to go round a circle by its own momentum and then repeats the first part of the performance, driving, however (by way of variety), with his foot instead of his hand. The whole performance is concluded by the car being driven up a steep slope to a platform only slightly more than the length of the car, upon which he suddenly stops and then continues his journey down a flight of stairs.

AN EXHIBITOR'S DIARY.

SATURDAY.—Why do exhibitors never get ready in time? Hardly a trade display has ever been opened with the stands completely filled and fitted, and the present Show is no exception. On this occasion the managers had given every facility, and by allowing firms to enter goods throughout the previous week had made ample provision for everyone to be ready for the public. Having been among the wise men who thus quickly got into position I have been able to wander around and see the nakedness of some stands where notable features should have been on view, and observe how anxious several industrious people were to make haste after the first visitors had appeared. It was ever thus.

From ten o'clock to noon there was a steady flow of people passing and re-passing along the avenues, and the arena soon became the centre of attraction—as it continued throughout the afternoon and evening. By two or three o'clock the scene became very animated, a large number of members of the Automobile Club having come in after lunch time. By tea time there was a splendid company, and the performance of Mr. Coles was evidently exciting lively anticipations. At the yard entrance in Barford Street cars were arriving all day and the gatekeepers had a busy time. The visitors were all intent on automobilism, and from a business point of view I fancy few of

the exhibitors were disappointed. Chatting with several of them it was clear that the inquiries made had been uniformly of a practical character, and one of the tire firms was especially satisfied with the many interested people who left their names at its stand. Trade in motor accessories, etc., was certainly brisk, and not a few society people were on the look-out for the smartest type of vehicle. Altogether the day has been one of briskness and business and the exhibition promises well.

MONDAY.—The Agricultural Hall is not a favourite with me as a place to spend Easter Monday. I have never before thus utilised the first Bank Holiday of the year, and hope I never shall do so again. Fortunately, next year's exhibition will fall early in May—instead of at a holiday season—and we shall be spared imprisonment while all the world makes merry holiday. There has again been a good attendance of the public, and although the enthusiastic motorist who must be at the beginning of every run, meet, or exhibition has been absent we have had a goodly company—evidently rather better than Saturday. Prominent among the callers at my stand—and it can be regarded as typical of many—have been many commercial and industrial magnates from the provinces. Evidently some of the business people of great towns like Newcastle, Leeds, Manchester, Bristol, Bradford, and elsewhere have taken advantage of the few days' respite to make acquaintance with the new industry. I noticed not a few were deeply interested in the Thorneycroft steam vehicles for heavy traffic, and mainly concerned with the development of the automobile movement, as it is likely to assist the industries of the country in their transport arrangements. Probably, the number of fashionable folk has been less than on Saturday, but this has found compensation in the greater number of business men, while the presence of the general public must be regarded as growing testimony to the progress of the industry.

I must not omit to chronicle the reports in the morning papers—to say nothing of the excellent notices which appeared in yesterday's journals. The *Daily Chronicle* had an excellent report mentioning by name some of the striking exhibits, and thus giving prominent advertisement in addition to the excellent value in the exhibition. The *Daily Mail* was rather hard upon those whose stands were not ready on the opening day, and the *Times*, too, called attention to the fact.

TUESDAY.—This has been a good day for those of us having accessories and such goods for sale, and many have been the orders taken. Among my callers have been three or four directors of motor-car services in various parts of the country, who have evidently come to the exhibition to learn rather than to buy. Still one never knows the results of such an exhibition as the present, and orders frequently come along weeks, and even months, after the exhibitions have closed their doors. So far there has been no wearying monotony for stall attendants, and the activity previously noted continues. This afternoon, while the Ladies' Band was performing, the attendance struck me as particularly good, and during the evening the anxiety to get into the arena was very marked. This opportunity for demonstrating the value of automobiles affords a good chance for manufacturers, and while some attention has been given to the steam and electric vehicles it is satisfactory to hear how interested the main bulk of visitors are in those of British make.

WEDNESDAY.—To-day has been one of great activity, and owing to the fine weather several exhibitors have been able to run their vehicles on the roads near the Hall—an advantage in view of several good friends of automobilism having arranged to pay a special visit owing to the dinner held in the evening. I counted a dozen new vehicles on the stands to-day—all having arrived since noon yesterday. Each day seems to bring its special class of visitor and references to "good" people have been frequent. Two or three lords, several honourables, and any number of public men have been in the Hall to-day. I have just been to the excellent dinner at which manufacturers, agents, and others in the trade enjoyed a few hours' relaxation from business. From impressions there gathered I should say that those dealing in small cars have done extremely well.

THURSDAY.—This, I am told, is press day, and when asked for my "copy" at noon I had none ready—a pardonable omission in one who is an exhibitor and not a journalist. And so my brief spell of pen-wielding ends.

X.

ARRANGEMENTS FOR THE THOUSAND-MILE TRIAL.*

BY THE HON. C. S. ROLLS.

It is, perhaps, necessary for me to state that as I have been slightly unwell I have not had time to carefully prepare a paper, but Mr. Johnson has jotted down a few notes, which with your permission I will read to you, and which may, I hope, lead to questions being asked on points concerning which owners and drivers are doubtful; and I shall be happy to do my best to clear up these points with his assistance.

CONTROLS.

The matter of controls seems to have caused considerable comment, and I think I cannot do better than read the remarks on this point which appeared in a recent number of "The Club Notes and Notices."

"Gentlemen who have entered their vehicles for this trial have expressed surprise, almost annoyance, at the number of stoppages for controls which are provided in the official programme of the 1,000-Mile Trial. They take, for instance, the first day's run, and point out that there are seventeen stoppages in the journey of 120 miles from London to Bristol. If these stoppages are analysed the following is the result:—In the first place the committee thought it well to suggest that there should be three stoppages for meals during each day's run, and that, as these stoppages will in most cases take place in large towns, precautions should be taken to prevent high speeds being used in passing into and out of these towns. It was therefore proposed in the original rules, which were submitted to, and approved by the firms which had expressed their intention of entering vehicles for this trial, that on entering each of such places every vehicle should be required to stop in order that the driver may receive a card, on which the time of his arrival is recorded, and may sign the time sheet bearing a similar record. This operation will probably occupy fifteen seconds. The vehicle will not be permitted to leave the control on the other side of the town until sufficient time has elapsed to permit of the compulsory stop for a meal, and to permit of the vehicle being driven from the inward control to the outward control at a speed not exceeding eight miles an hour. The operation at the outward control will be similar to that at the inward control.

"Each stop for meals is indicated in the official programme by three stops, viz.:—One for the inward control, one for the meal, and one for the outward control. It will be seen, therefore, that of the seventeen stoppages above referred to—

- 9 are in connection with meals.
- 2 are for the start of the run, and stop of the run respectively.
- 1 for the outward control of London.
- 1 for the inward control of Bristol.
- 2 are for the outward and inward controls of Reading (a populous town).
- 2 are for the outward and inward controls of Maidenhead. (A place having narrow streets, and where owing to a recent fatal accident caused by an ungovernable horse, it is desirable that slow speed should be observed; and where indeed in any case a stoppage would be necessary for the toll-gate.)

"The other controls are green flag controls, which do not necessitate a stop, but only require that a vehicle should be slowed down to eight miles an hour whilst passing through certain towns.

"In the run London to Bristol, 118½ miles—there are not more than 22½ miles within control, of which 11 miles constitute the passage out of the suburbs of London. If the time occupied in passing through these controls is calculated at 2½ hours, and ½ hours added for meals, there remain 8 hours between 7 a.m. and 7 p.m. during which the vehicle may cover 96 miles outside controls, and which allow an average of 12 miles an hour.

"Probably such an arrangement as that provided by the official programme would not be selected for a pleasure tour. But it should be borne in mind that the 1,000-Mile Trial is not a pleasure tour, but that it is not only an extremely serious mechanical trial, designed for the purpose of proving to the public the reliability of the motor vehicle as a method of everyday transport, but that the foundation of the scheme is that the trial should be a means of popularising automobilism in this country.

"The committee, therefore, in submitting to those interested the rules which provided for controls, had not in view so much the personal convenience or wishes of drivers, as the valuable results of the trial on the movement in this country—and consequently on the business of manufacturers and agents—which the trial was intended to bring about.

"When the many instances are remembered in connection with Club tours, in which certain members have been seen to dash through towns without any consideration for other users of the road, and of the harm which such behaviour has done and is doing to the movement in this country, it will doubtless be recognised by sober-minded motorists that the Committee are right in taking every possible precaution to prevent any act by selfish individuals during the trial which would have the opposite result to that desired, viz., the popularisation of the automobile.

"The Committee, by consulting the Local Authorities and County and Municipal Police on the question of controls, have done their best to prepare the official mind throughout the country for slow speeds of the trial vehicles in towns, and, as has before been stated, in the general interest of the movement, and in fairness to those who carefully observe the regulations which for the advancement of automobilism the Com-

mittee have laid down, they are determined to use their powers to disqualify any vehicle the driver of which, forgetful of the serious importance of the trial, fails to follow the regulations as regards speed through towns, and general consideration of other users of the highway."

The process at green flag controls is simplicity itself, inasmuch as a driver on arriving at a green flag has simply to slow the vehicle down to 8 miles an hour, keep at this speed until he arrives at the white flag or at the point indicated in the programme for the white flag when normal speed may then be resumed. At green flags, therefore, no stop is made, but the time-keepers will make a record of the time occupied by each vehicle in passing between the green and white flags, and a driver will run the risk of having the vehicle disqualified by running at a speed greater than 8 miles an hour between these flags.

As regards red flag controls, on arriving at a red flag it is necessary to stop, and in doing so not to pull up in the middle of the road, but as close as possible to the near side, immediately in rear of the vehicle (if there be one) which may have arrived previously, and which may be engaging the attention of the time-keepers. There will be two time-keepers. One time-keeper, on the arrival of a car, will write on the control card the number of the vehicle, the time of arrival, and his signature, and this card will be handed to the driver. The other time-keeper will note on a piece of paper the number of the vehicle, the time of arrival, and the driver will be required to sign this paper in agreement with the entry made thereon. The vehicle will then proceed on its way at 8 miles an hour through the town, or, if a stop for a meal is provided at that town, to the hotel at which the meal has been previously ordered, and will arrive at the outward control in time to start after the proper period has elapsed since its arrival at the red flag. On arriving at a white flag the driver will pull up again on the near side, will hand his card to the time-keeper, who will write thereon the time at which the vehicle is due to start and will sign the card and return it to the driver. The second time-keeper at the outward control will make a similar entry on his time-sheet and the driver will sign this sheet. The time-keeper will give the signal to start when the proper time arrives, and the vehicle will proceed on its journey again at normal speed.

The driver on arriving at the exhibition building in the evening will hand all his control cards to the time-keeper there who will proceed to work out the averages of each vehicle.

CERTIFICATES.

On the arrival of the vehicles at Bristol the driver of each vehicle will be given a large certificate on which the day's journey is printed and on which spaces are left for the average speeds to be filled in at the end of the day's run. It is intended that this certificate should be exhibited on the vehicle at each of the exhibitions, so that visitors may see at a glance what sort of run the vehicle has made. The difficulty which presented itself was how these certificates are to be carried from one place to another. They have, therefore, been made to fold in two, so that they may be placed under the cushions of the driving seat, and, as further protection, cases specially made to fit them have been made and may be purchased by giving orders to the club steward. Personally I should advise every driver to obtain one of these cases.

OFFICIAL PROGRAMME.

The official programme is a somewhat bulky and cumbersome volume, a fact to which some of the writers on the press have alluded.

The programme is made quarto size, because it is found from experience that in order to read instructions on a car it is well to have the instructions in big print with plenty of white between the lines. If big print had been employed on small pages the book would have run into 400 instead of 200 pages.

An endeavour has been to secure that every sort of information concerning the trial should be incorporated under one cover, viz., the official programme. It contains full instructions as to the route, the rules, an itinerary, the excellent maps published by the motor-car papers, the contours of the four hills on which hill-climbing trials are to be held, information as to petrol stores and hotels, and a list of the vehicles entered, giving the names and addresses of their manufacturers or agents, weights, horse-powers, carrying capacity, and prices, and another list of the vehicles shown in their various classes, with a table in which can be entered the averages as they are published every day.

But one of the most important portions of the programme are the left hand pages, the greater proportion of which are devoted to illustrated announcements concerning each of the vehicles entered. These pages were given by the committee to those who entered vehicles in Section 1 free of charge.

The programme will, it is believed, be the most complete catalogue of motor-vehicles which has ever been issued in this country, and when there is added to it, as there will be after the trial, the records made by the various vehicles, an intending purchaser will be in possession of the most unique information concerning almost every vehicle which is on sale at the present time. It is not intended that the sale of this programme should pay for its cost, but it is intended that it should be sold during the trial, and that after the trial it should be widely circulated to every person who shows an inclination to take an interest in automobilism.

I may add that the special waterproof covers for the programme, which contain pockets specially designed to carry control cards, may be purchased by ordering from the club steward.

The programme will be ready for distribution on Saturday, thus giving ample time for perusal on Sunday.

MEALS.

It has been our lot, very naturally, to hear a good deal of good-

* Paper read at the Dinner of those participating in the 1,000 Miles Trial organised by Mr. C. Cordingley for the Automobile Club at the Agricultural Hall, Islington, on Wednesday, April 18th, 1900.

natured grumbling about every item, I think, contained in the rules. On the one hand the committee is informed that it should allow at least two hours for the mid-day meal, so that *chauffeurs* may have an opportunity of enjoying *post-prandial* cigarettes, coffee, and liqueurs. On the other hand the committee is asked why drivers should be compelled to stop for meals at all. One often wonders whether some of the critics have tried what it is to drive on an average of 100 miles a day continuously. If no compulsory meal-times had been provided it would have become partly a test of the endurance of the drivers, and no benefit could be obtained by the continuous driving. Furthermore, surely it is desired that the vehicles should be seen and brought under the notice of as many people as possible, and by having compulsory stops at such big centres as Bath, Gloucester, Worcester, Durham, York, Leicester, etc., the vehicles will be brought under the examination of the inhabitants of these centres who otherwise would simply have seen them run through their cities or towns.

THE START.

Whether the arrangements as regards the marshalling of the vehicles at the start are successful, well organised, and impressive, or whether they are disorganised muddles, must depend entirely upon the good sense of the drivers. First of all, at next Monday's start the vehicles are to be drawn up in the order of their classification, which will be shown in the official programme, that is to say, the vehicles in Section 1, Class A, vehicles of a selling price of £200 or less, will be leading the procession from Grosvenor Place, and so on. And if drivers on their arrival at Grosvenor Place have studied what position they are to take in the procession, it will be extremely easy for them to drive into their positions on their arrival there instead of "blazing" up and down Grosvenor Place in hopeless ignorance.

Members of the club have kindly consented to assist in organising this procession. It is to be trusted that drivers will take up their places immediately on their arrival. At five minutes to seven engines should be started, passengers got on board, and drivers should be in their seats. At seven o'clock precisely the signal will be given to start, and the vehicles will proceed in procession towards Knightsbridge.

It must be borne in mind that vehicles may not pass others, unless of course the vehicle in front stops and the driver signs for other vehicles to pass him, in such a case the driver of the vehicle which has stopped must not pass other vehicles to regain his position. It should also be borne in mind that the rules regarding speed within controls comes into operation on Saturday morning next, the 21st inst. And therefore vehicles driving to and from the Agricultural Hall on that day, and vehicles driving to the start on Monday must not drive at more than eight miles an hour.

On the arrival of the vehicles at the eleventh milestone from London, beyond Hounslow Barrack Station, they will draw up in the order in which they started, each vehicle being close behind the vehicle in front of it and close to the near side. The vehicles will then be started at half a minute's interval, and in order that this may be successfully accomplished drivers should not leave their seats, but each vehicle should present itself at the starting point immediately the vehicle in front of it has been started therefrom.

The ordinary system of control cards and time-sheets will be observed at Grosvenor Place and Hounslow Barrack Station starting points respectively.

It is hoped that vehicles may be in their places at Grosvenor Place by 6.30 a.m.

This process will be repeated at the starting of every day's run, the only difference being that the order of starting will be the order of the arrival on the day previous, and the vehicles will be placed in that order outside the exhibition building, and start away in procession to the outward control, exactly in the same manner as they will start away from Grosvenor Place.

SPEED.

We next have to deal with the important matter of speed.

Personally I share the selfish wish that we could all "blaze" away at top speed. But when one considers that the whole purpose of the trial will be defeated, that the large amount of money spent on it will be wasted, and that the automobile cause may be retarded for years by inconsiderate driving during this trial, one feels bound to make up one's mind that personal inclinations to "pile on top speed" shall be sacrificed to the great consideration of the advance of automobilism.

The difficulty is to persuade oneself that one is really doing harm by driving fast in the presence of other people, but it is an undoubted fact that high speeds on the road are doing a lot of harm to automobilism. It is at the outset of the movement that these high speeds must be avoided. When cycles were first introduced people were horrified at seeing the cycles going at speeds which had not been attained by other vehicles; they were not used to the sight of people moving on the roads at a rate of over 10 miles an hour, and then added to this certain class of cyclists showed no consideration whatever for other people on the road, and so the term "cads on castors" was readily adopted. People now take no notice whatever of a bicycle going along at 20 miles an hour; they have got used to it and it no longer shocks them; but when they see a heavy motor-vehicle driven by a man in a mask, with a weird looking shiny black jacket, and general appearance of being in armour-plate, travelling at 30 miles an hour, raising a cloud of dust, and propelled by a force which they do not understand, and leaving behind it a smell, which, sweeter than Eau de Cologne to the motorist, is to them abominable, they naturally say that we are "madmen on motors," and that such practice must end in the death of hundreds of

people, and that they will do their very best to see that such laws are made as to make the use of motors on the roads illegal, or to put such restrictions on their use as to make motoring a boredom, not a pleasure. One cannot wonder at these feelings when it is recollected that onlookers have not the slightest comprehension of the wonderful control that the driver has over his machine. The impression they have is that the thing is running away, or may be entirely out of the control of the driver at any moment. They do not know that the driver has absolute confidence in his control over the machine, and that when driving at thirty miles an hour he is talking to his companion as easily as if he were seated in his armchair at home. For this reason, until the public have become accustomed to high speeds, fast driving in the presence of the public must be injurious to the movement, and as regards this trial, in which over eighty motor-vehicles have been entered, if the public are to see vehicle after vehicle come streaming along the road in clouds of dust at high speeds varying from fifteen to forty miles an hour, there will, I believe, be such an outcry throughout the country that we automobilists shall have our wings clipped, and restrictions will be placed upon us by the law that will be such as to prevent the moneyed classes, who, after all, must be the patrons of automobilism, from purchasing motor-vehicles. This statement may seem exaggerated, but it is a statement of the opinion of many thinking automobilists who are in a position to feel the pulse of public opinion. I may quote one instance, viz., that of a gentleman who was on the point of giving, or had given, an order for an automobile costing £800, who when he saw that one of the local bodies was recommending that all the automobiles should be numbered, he thereupon cancelled his order. The driving of single vehicles at high speed has already aroused throughout the country a very strong movement with a view to bring about further restrictive legislation. If such strong feeling has been aroused by single vehicles what would be the feeling aroused if high speeds were indulged in by eighty vehicles driving through the length and breadth of the country? I believe that the manufacturers and private owners will have the good sense not to employ high speeds in the presence of the public, and personally, if I were a manufacturer, I should instruct my driver that if he were detected driving at any speed above the legal limit in the presence of the public, or in passing a privately owned carriage, I would give him "the sack."

The question will naturally be asked, Is the 1,000-Mile Trial simply to be a crawl along at 12 miles an hour? It is clear from the rules that the committee do not undertake to act as policemen. They have given notice to the police throughout the country of the Trial, and they leave the police to see that the law is not flagrantly broken, and they tell a competitor that if he is prosecuted by the police he may be disqualified by the committee, and they further tell a competitor that if he is found guilty of fast driving or want of consideration for other users of the road he will be disqualified, and they also tell a competitor that if he makes an average of over 12 miles an hour he will gain nothing by it, as the judges will not consider, and the committee will not record any average in excess of 12 miles an hour.

Speaking personally, and it must be clearly understood that in making this statement I speak as a competitor, and not as a member of the Trials Committee, it is clear that there are stretches of the road in the 1,000-Mile Trial where high speeds may be employed without prejudicing the automobile movement, for the simple reason that there will be no onlookers, and without want of consideration to other users of the road for the reason that there will be no other users. I refer to the long stretches of road on which another vehicle could be seen half a mile off, and speed consequently moderated long before encountering it, and where there are no, or few, pedestrians.

It is to be hoped that drivers will content themselves with moderate speed, except in such desolate regions as I have alluded to. If it is desired to prove the speed capabilities of a vehicle I think that such proof can be afforded by the four hill-climbing trials, and by the speed trial which, by the courtesy of the Duke of Portland, his agent, Mr. Turner, has kindly arranged shall take place over a mile of private road at Welbeck. Mr. Johnson drove Mr. Turner over the estate last Saturday, and has selected this mile of road as being the only mile suitable at Welbeck for the purpose. It is slightly inclined. It is suggested that times of vehicles should be taken on the up incline and again on the down incline, so as to arrive at some idea of their top speed. This speed trial is, of course, optional, and as this road is several miles off the route it would be unwise for vehicles which are not capable of driving at twenty miles an hour to take part in it, as it would cause considerable delay in their arrival at Lincoln.

RULES FOR DOWN HILL.

It will be observed that the rules provide that there should not be any passing on down gradients. This rule has been severely criticised; but it must be borne in mind that the committee submitted this and other rules to a meeting of manufacturers who had entered their vehicles for their discussion before the rules were finally adopted, and it appeared that the manufacturers and agents then present quite approved of all the rules, and I think this one in particular will recommend itself to any thinking automobilist.

This trial to be successful, from a public point of view, should be carried out without a single accident. Suppose that sixty vehicles complete the trial, we can point to 60,000 miles of motor travel without an accident. The majority of accidents which occur in France occur on down hills. In racing it may be worth while to run the risk that undoubtedly attends high speeds on descents. In France a few deaths connected with motor racing do not seem to be taken into consideration,

But in this trial there is nothing to be gained by high speeds down hill, and an accident would, instead of being simply recorded as it is in France, be exaggerated and made much of by a section of the English Press, and, as the Attorney-General remarked at the Automobile Club, one accident is more noticed by the British Press than 10,000 miles of successful running. Therefore the rules provide that so long as a vehicle is going at the legal limit it may not be passed on a down hill by the vehicle behind it. I may say that if there is a dispute between two drivers as to whether the vehicle which was passed by another on a descent was or was not going at 12 miles an hour, the committee will be inclined to decide in favour of the vehicle which is passed, as the trial is not a race, and there is nothing to be gained by passing on a descent on the ground that the other competitor was only going at, say, 10 instead of 12 miles an hour. The rules are framed by the committee not with a view to imposing useless restrictions, but with the genuine wish that the trial should have a good effect on the automobile movement in this country, and consequently on the success of manufacturers and agents.

Before leaving the matter of speeds I would remind drivers that the Chief Constable for the County of Lincoln has advised the Club that he has given particular instructions to his men to see that the law as regards speed is kept within his district. The County of Lincoln is entered first of all at Dunham Bridge, and the route runs through the county from Dunham Bridge through Lincoln, and from Lincoln to close upon Newark. It is evident that some of the chief officials of the police look upon the law as to speed as one which need not be taken quite literally, and as regards speed on the high road in desolate districts they allow the same latitude as regards this law as the police generally permit, for instance, in the case of unattended horses. One cannot blame the Chief Constable of Lincoln if he feels it is his duty to see that the law is strictly carried out as regards the speed of motor-vehicles, so long as he also protects automobilists from the danger to which they are liable owing to unattended horses. At any rate, the Chief Constable for Lincoln is an honest gentleman. He has told us what we may expect. But I regret to hear that in another portion of the country not far removed from Lincoln the police are engaged in measuring up a mile, presumably with the object of trapping automobilists and proving that they are driving in excess of twelve miles an hour. This appears to me to be a childish proceeding. Surely it is not the province of the police, when they are informed that motor-vehicles are to pass through their district to lay traps for the unwary motorists, but rather to inform the motorists that it is the intention of the police to see that the law is strictly adhered to, and that they will take steps to accurately ascertain at what speed the vehicle is driven. If this were done they would probably succeed in making motorists keep the law. But what they are doing in this particular instance is to lay low in the hope that they may be able to prosecute motorists who break the letter of the law. Their intention seems to be not to prevent the law from being broken, but to permit the law to be broken and then to punish the offender.

There is another matter still connected with speed on which I venture to lay great stress, that is that motorists should avoid driving by horse-drawn vehicles at high speeds. It really means but little loss of time to slow down on meeting a carriage, and it is, I think, a somewhat ungentlemanly proceeding to drive past any vehicle, especially one containing ladies, at high speed. In dusty weather it is almost brutal, owing to the enormous clouds of dust which the tires of a motor-carriage throw into the air.

Only recently Mr. Johnson slowed down on meeting a brougham and pair in the Midlands, not having the slightest idea who were the occupants, and two hours later found himself the guest of the lady who was the occupant of the carriage, and was profusely thanked by her for the small consideration shown by him. If this simple precaution were taken motorists would soon have public opinion with them.

HILL CLIMBING TRIALS.

The portions of the journey to which I look forward with the keenest interest are those on which records are to be taken in hill climbing trials. There should be some good speeds shown in the ascent of these hills.

The first one is Taddington Hill, before arriving at Buxton. It presents no very serious difficulties. The gradient is easy; I believe that there is nothing steeper than 1 in 15. The distance is about two miles and a half; and I have known a vehicle of no great power with two persons on board to accomplish the first mile in seven minutes, the second mile in nine minutes, and the last half mile in five minutes, making twenty-one minutes for the 2½ miles, or 7 miles an hour.

The descent to Buxton has extremely awkward corners in it, and great care should be taken in driving down as some of the corners are almost acute angles, and misjudgment of speed would have a serious result. On Easter Sunday morning there were two men killed through a bicycle accident on this hill.

The second hill is Shap Fell. The climbing of this hill is optional. There was at one time a considerable correspondence between the sellers of two vehicles concerning a suggested race up Shap Fell, I think fifty times. It is remarkable that neither of those vehicles, the qualities of which were so highly extolled in letters to the motor newspapers, has been entered for the 1,000-Mile Trial. Shap Fell is not a very dreadful hill; the gradients for the first eight and a-half miles are fairly easy. There is then a descent of about one in ten. This hill climbing trial is to be divided into two portions, one of which will terminate at the brow of this sharp descent, and the other will commence at the foot of the sharp descent and terminate at the summit. The vehicles will be timed in making the descent referred to, not with a view to prove high speed, but

with a view to ascertain what is the lowest speed at which the vehicles can make this descent without actually stopping, and thus prove the control the driver has over his machine. It is a trial of brake power. It is a question whether trials to ascertain in what space vehicles driven at a certain speed can pull up from the time the signal is given to them to stop are visible, inasmuch as they require the use of brake power which should only be used in case of emergency, and the sudden application of the brake is apt to rip the tires off and to severely strain the machine.

The second part of the ascent of Shap Fell is the really stiff portion of the hill. It is composed of 1 mile 686 yards including gradients of 1 in 10, 11, and 13. The surface is bad; but any decent vehicle will make the ascent without difficulty. The vehicles will descend from the top of Shap in procession after all have made the ascent.

The third hill-climbing trial is on Dunmail Raise, the summit of which is the boundary between Westmoreland and Cumberland. The County Surveyor for Westmoreland, who has been most good in supplying information concerning both Shap Fell and Dunmail Raise stated that the ascent of Dunmail Raise included 83 yds. and a gradient of 1 in 6½. Mr. Johnson recently had the opportunity of ascending this hill on his car, and he felt confident that there was no gradient of 1 in 6½. He wrote to the county surveyor informing him of his opinion, and asking whether it was not possible that some mistake had been made. He replied that on looking into the figures again he found that a mistake had been made, and it appears that there is nothing steeper than about 1 in 10. The ascent is one mile five furlongs in length, but it should be easily surmounted by a car in which horse power and weight are properly apportioned. For instance, Dr. Dawson Turner's Delahaye with three persons and luggage on board made the ascent at the rate of nine miles an hour.

The fourth hill climbing trial is to take place on Birkhill, which leads to the summit of a long pass, from which we shall drive from Moffat towards Peebles. The trial is to be over two miles ascent, and I believe that it will be found that the last mile of this hill is as stiff as anything we have to encounter. It comprises an ascent of 100 yards in the mile, or an average of 1 in 17.6. Dr. Turner's carriage ascended these two miles at the rate of 9 miles and 7½ miles per hour respectively.

These four hill-climbing trials are, as I stated before, perhaps the most important portions of the trial, as in a country where no speed is allowed in excess of 12 miles an hour, it is very important that vehicles should be compelled to ascend hills at good speeds.

When talking over the matter of hill climbing speeds with members of the Club, I have been reminded that to ascend hills at a good speed involves high horse-power. I cannot agree with this view, seeing that there are on the market at the present time vehicles which are being sold for less than £200 which can ascend good stiff hills at from 7 to 9 miles an hour. It is not so much the matter of high horse-power as good transmission of horse-power, and proper proportion of horse-power and weight.

CLEANING.

As will be seen from the rules, a total of three hours per day is allowed for cleaning, lubricating, and attending to the motor. By some this is said to be far too short a time, by others too long, but a carriage however dirty can be washed in an hour, and the machine should not require more than an hour's attention at the end of a day's run in order to be able to undertake the next day's run.

The racing cars at Spa arrived at the hotel in the filthiest condition possible, for the race had been run through thick mud. The mechanic of Chevalier de Knyff washed his big carriage, and certainly the washing did not occupy an hour; the greasing, lubricating, etc., were completed in less than an hour; after that the man overhauled the nuts, etc., filled up the oil and water reservoirs, and in half an hour was lounging outside the hotel, having cleaned, dressed, and also lubricated himself.

If a driver wishes to remove his vehicle from the exhibition building for cleaning he must first obtain a "pass out," on which will be recorded the hour at which the vehicle is taken from the exhibition buildings. On his return he must present this "pass-out" card, in order that there may be recorded on it the hour of his return from cleaning. He will retain this card and give it to the timekeeper with his other control cards at the end of the day's run next following. If the total time during which the vehicle is absent from the exhibition building exceeds three hours, such excess will be added to the running time of the day following.

At certain places the vehicles will not be permitted out of the exhibition building on the evening of arrival for washing. The washing will take place early on the day following.

EXHIBITIONS.

It does not appear probable that the attendance at the Provincial exhibitions will be a large one. In fact, it has not been sought that the attendance should be a large one. The people we want to have at the exhibitions are people who are thinking of, and who are able to buy vehicles. It is not of the slightest use to have a big "sixpenny crowd" of loafers. I am told, however, from nearly all centres that there is considerable interest being taken in the trial by the county people and others, and that the exhibitions will be well attended, so far as possible buyers are concerned. Bristol will perhaps be one of the least enthusiastic, not so far as its workers are concerned, but so far as the general population is concerned. In Cheltenham one member of the committee alone has already sold 100 tickets for the exhibition. The local newspapers are devoting considerable space to the Trial and exhibitions.

I do not think that we can contemplate that very many orders will

be taken at the exhibitions, because naturally an intending purchaser will prefer to await the finish of the Trial before placing an order for any machine he fancies. Therefore the financial results of manufacturers and agents must not be reckoned by the number of orders taken during the Trial, since I am confident that very few orders will be given until after the Trial is completed.

The best thanks of all concerned are due to the Provincial Committees, and especially to the Hon. Secretaries of those Committees seeing what a vast amount of work they have accomplished, not only in connection with the exhibitions, but also in connection with the arrangements on the road.

SPECTATORS.

It has been rumoured that vehicles which have not entered for the 1,000-Mile Trial will be running along the route of the trial, side by side with the trial vehicles. It is scarcely probable that this can be true. One thing must be taken into consideration, viz.: that if any member of the Club were to be guilty of such an act, the committee might look upon it as being one of the acts for which they have power to expel from the Club.

Although the trial is not a race, vehicles which are not entered ought to keep as religiously off the road of the competing vehicles as non-competing yachts keep off the course of a yacht-race.

GENERAL RESULTS.

The committee of the club in designing this trial have a strong hope that it will do very much to bring automobilism prominently before the public of this country; that it will, so to speak, force people to recognise motors, force people to think about them and to acknowledge their capabilities to cover long distances; to acknowledge they are not toys, but extraordinary creations which must eventually revolutionise the road. It is hoped, too, that the trial may show the pleasure to be derived from motoring; and, for that reason, it is most fortunate that there is a private owner's section, because the fact that private owners are taking part in the trial will show at once that there are great pleasures to be derived from driving a motor-vehicle. I feel sure that special interest will be taken in the voiturette class, the cheap little vehicle which first appeals to anyone taking up automobilism. There are a large number of voiturettes entered, and it will be of very great interest to see how suitable they are for real touring work as opposed to boulevard and park work.

Possibly the 1,000-Mile Trial may be a source of bitter disappointment to some whose vehicles may not prove successful. But there will be one consolation, viz., that the makers of and the agents for these vehicles will have their eyes opened to the defects of the vehicles, and the defects will be remedied, and we shall arrive sooner at the condition of having nothing but reliable vehicles on the roads. These tests of reliability must prove beneficial in this respect, and as Mr. Montagu said of racing, this competition of reliability will "improve the breed of motor vehicles."

It will be noted that no attempt has been made to arrive at the fuel consumption of the various vehicles. This can be satisfactorily arrived at by means of the 100-Mile Trials.

What, however, is far more important to automobilism at present is the matter of tires. We are, I believe, debarred from purchasing Michelin pneumatic tires, and no vehicle can be entered to represent this country in racing for the Gordon-Bennett cup unless the tires are constructed in this country. I am pleased to say that a set of pneumatic tires have been entered by the Clipper Pneumatic Tire Company for the trial, and although I believe these tires are not at present made in England they are to be constructed here very shortly. It will, therefore, be a matter of great interest to see how these tires wear over a distance of 1,000 miles. From the users', though not perhaps from the scientific point of view, the matter of tires is of far more importance than fuel consumption. If fuel costs halfpenny per mile pneumatic tires may be said to cost about 2d. or 2½d. per mile.

It was thought desirable that at the dinner held here to-night all people should be present who are interested in the trial; and we have, therefore, here to-night those whose good fortune it is to drive motor-vehicles as a profession, and those who have the misfortune to have other professions, and who have only an occasional opportunity of driving motors. We must look to the former class to shine conspicuously in proving the reliability of motor-vehicles in the forthcoming trial. I need scarcely add that if I can be of the slightest assistance to anyone connected with the trial, be he manufacturer, agent, owner, or professional driver, I shall be only too happy to do my best to help him.

I hope that now those taking part in the trial will ask any questions they wish concerning the interpretation of the rules, or concerning matters connected with the arrangements, but it must be borne in mind that it is too late to alter the rules now, therefore we cannot now discuss whether they are good, bad, or indifferent. I only hope that this paper and the discussion which may follow it may be of service to the participants of the trial.

In conclusion I must apologise for the rough condition in which this paper has been placed before you. I have had no time to "knock it into shape," for the reason I stated at the beginning.

Permit me to wish everyone connected with the trial success; that every vehicle may run through well; that the creations on which much money, time, and thought have been expended may satisfy their makers' highest hopes; that a spirit of sport and fair play will prevail throughout the trial, and that it may result in a very marked advance of automobilism in this kingdom.

THE 1000-MILE TRIAL.

THE start for this great trial will take place on Monday next from Grosvenor Place, Hyde Park Corner, W., the vehicles assembling at 6.30 a.m., and the "Drive" commencing at 7 p.m. precisely. The following is a complete list of the entries in the two sections into which the vehicles are divided:—

SECTION I. (Cars entered by Manufacturer or Agent.)		39	Century Tandem
Class A.	Cars declared at a selling price of £200 or less.	3	Motor Quadricycles, carrying two persons
	1 Benz Ideal	4	Ariel Quadricycle
	2 Benz Ideal		Ariel Tricycle with Whippet attachment
	5 Locomobile Steam Carriage	Class F.	Public Service Vehicles.
	16 Gladiator Voiturette	6	Motor Mfg. Company's Balmoral Char-a-banc
	18 Endurance Car	38	Daimler Public Service Vehicle
	19 Orient Express		
	27 New Orleans Car		
	28 New Orleans Car		
	29 Eureka Car		
Class B.	30 Eureka Car		
	33 Décauville	Class A.	Cars declared at a selling price of £200 or less
	34 Décauville	A25	Benz Ideal (Mrs. Bazalgette)
	42 3½ h.p. Voiturette		
	41 International Victoria	Class B.	Cars declared at a selling price of more than £200, but not more than £300.
	44 International Victoria	A18	6 h.p. Light Daimler (Mr. Copland)
	48 Humber Voiturette	A24	Mors Voiturette (Mr. Phillips)
	51 Star Voiturette	Class C.	Cars declared at a selling price of more than £300, but not more than £500.
	52 Roots and Venables	A2	6 h.p. Panhard (Mr. Butler)
Class C.	Cars declared at a selling price of more than £200, and not more than £300	A3	6 h.p. Panhard (Mr. T. B. Browne)
	10 M. M. Co.'s Princess Car	A5	Steam Car (Mr. Cyril Gooch)
	11 M. M. Co.'s Princess Car	A7	6 h.p. Daimler (Mr. A. Harmsworth)
	13 Ariel Panhard Voiturette	A9	8 h.p. Napier (Mr. Harvey du Cros)
	14 De Dion Voiturette	A10	8 h.p. Napier (Mr. E. Kennard)
	15 De Dion Voiturette	A12	6 h.p. Daimler (Mr. H. Edmunds)
	24 Marshall Carriage	A13	6 h.p. Daimler (Mr. E. Estcourt)
	31 M.C.C. Triumph	A15	5 h.p. Phaeton (Mr. R. M. Wilson)
	32 M.C.C. Triumph	A21	6 h.p. Daimler (Mr. E. Pitman)
	40 Wolseley Voiturette	Class C.	Cars declared at a selling price of more than £300, but not more than £500
Class D.	45 S. S. Carriage	A23	6½ h.p. Motor Mfg. Co.'s Phaeton (Mr. C. Cordingley)
	49 Marshall Carriage	A26	6 h.p. Daimler (Mr. C. K. Gregson)
	53 Wolseley Carriage	A30	6 h.p. Daimler (Mr. J. D. Siddeley)
		A31	6 h.p. Daimler (Mr. W. Exe)
		Class D.	Cars declared at a selling price of more than £500.

MOTOR-CYCLE RACING.

WOOD GREEN.

THE Gamage Cycling and Athletic Club held a meet on the Wood Green track on Good Friday, when two motor events figured in the programme.

The five-mile motor-tricycle race ended in a win for Mr. Ford, in 8min. 39 2-5sec., from a flying start, the race resulting as follows:—R. Moffat Ford, Anerley, 1; C. Buck, M.M.C., 2; F. F. Wellington, Phebus Aster, 3.

In the five-mile motor-tandem race, T. E. Newman and F. W. Chase were first in 8min. 29 4-5sec., thus being ten seconds quicker than the motor-tricycle.

THE CRYSTAL PALACE.

Unfavourable weather doubtless lessened the attendance at the Crystal Palace on Easter Monday, but despite that an attendance of about 20,000 was credited at the motor and cycle races. In the former section Mr. Edmund Payne was the judge, Messrs. F. T. Bidlake and F. W. Baily being the timekeepers.

The first event was a five-mile handicap for roadster machines, in which the final order was as follows, the winner's time being 9min. 24sec.:—F. F. Wellington (Phebus Aster), scratch, 1; J. Cusins, two laps start, 2; C. Machin (Phebus Aster), scratch, 3. The race was won by half a lap.

The time of Mr. Jarrott in the ten mile scratch race was 15min. 39 4-5 sec., and he won by fifty yards, half a lap dividing second and third. C. Jarrott (Phebus Aster), scratch, 1; F. F. Wellington (Phebus Aster), 2; J. W. Stocks (Ariel), 3; S. F. Edge (Ariel) 4.

The chief event of the day was the contest for the Crystal Palace Brassard (value £110). Unfortunately the holder, Mr. C. J. Wridgway was an absentee, and there were only four entrants, viz., Messrs. C. Jarrott (Phebus Aster), R. Moffat Ford (Phebus Aster), J. W. Stocks (Ariel), and C. Sangster (Ariel). The first named went ahead from the start, and had little difficulty in winning by over two miles from Stocks. Sangster was a mile behind Stocks. The winner covered 38 miles 868 yds. in the hour, beating the previous British record by Bécconnais at New Brighton, viz., 37 miles 480 yds. The times of the winner were:—

Mls.	Time.	Mls.	Time.
1	1 30½	25	38 17½
5	7 40	30	46 13½
10	15 18½	35	54 16½
15	22 52½	38	59 11½
20	30 35½		

A feature of the meeting was the use by Messrs. Jarrott and Wellington of machines fitted with two motors in place of one. The motors are arranged side by side inside the rear axle; they are of the Aster air-cooled type, capable of indicating 3½ h.p. each, or a total of 7 h.p. This is the first time such high-powered racing motor-tricycles have been used in this country, although in France they are now quite common.

CATFORD.

On Easter Monday there was a large attendance at the Catford track when a five miles motor-bicycle race took place. E. A. Buck finished first in 11min. 26 4-5sec., winning by two laps, J. Lennard being second. J. Pugh also competed, but failed to finish.

PUTNEY.

On Monday the annual sports of the Putney Athletic Club were held at the Putney Velodrome, when A. Boon was successful in the five miles motor-cycle pursuit race.

BIRMINGHAM.

On Tuesday and Wednesday a motor-cycle tournament was held at Aston Villa Grounds, Birmingham, promoted by the *Bicycling News*. The attendance on Tuesday was fairly good, but fell off considerably on Wednesday. Fortunately fine weather prevailed, and some good racing was witnessed.

The results on Tuesday were as follows:—

One Mile Motor Tricycle Handicap.—Heat winners: S. F. Edge, scratch; A. C. Edge, 7sec.; J. Gibbons, walk over; fastest loser, C. Sangster. Final, A. C. Edge, 1; S. F. Edge, 2; J. Gibbons, 3. Won easily in ten lengths, the same distance dividing second and third. Time, 1min. 43 2-5sec. During this race occurred the only spill of the afternoon. That was owing to the steering gear of W. Dunn's machine going wrong round a curve, and coming into collision with the hoarding, causing the rider to turn a somersault among the spectators. He escaped any consequences more serious than a bruised wrist, and a boy on whom

he fell was less hurt than he was surprised. The tricycle itself was completely smashed.

Five-miles Motor Tricycle Handicap.—Heat winners: C. Sangster, 28sec.; G. Sangster, Ariel, 60sec.; J. W. Stocks, Ariel, scratch; fastest loser, G. Sangster. Final: C. Sangster, 1; Stocks, 2; A. C. Edge, 3. Won by half a lap. Time, 9min. 25 2-5sec.

Ten-miles Motor Quadricycle Match.—J. W. Stocks and another beat S. F. Edge and another by half a lap. Time, 21min. 14 3-5sec.

Ten Miles Motor Tricycle Scratch Race.—W. Dunn, 1; S. F. Edge, 2. Six started, but only Dunn and Edge finished. J. W. Stocks, after completing 7½ miles, was leading by a lap and a half when his machine went wrong, necessitating his retirement. Time, 17min. 48sec.

On Wednesday the following events were decided:—

Five Miles Motor Tricycle Handicap.—W. Dunn, 35sec., 1; S. F. Edge, scratch, 2; C. Sangster, 50sec., 3; J. W. Stocks, 25sec., 0. Stocks' tire deflated one and a-half laps from home causing his retirement. Time, 8min. 20 2-5sec.

One Mile Motor Tricycle Handicap.—J. W. Stocks, scratch, 1; W. Dunn, 7sec., 2; A. C. Edge, 7sec., 3. Time, 1min. 43sec.

Twenty-five Miles Motor Tricycle Match.—J. W. Stocks beat S. F. Edge by six yards, his time being 45min. 15 1-5sec.

Ten Miles Motor Tricycle Scratch Race.—J. W. Stocks, 1; G. Sangster, 2; W. Dunn, 3; A. C. Edge, 0. Time, 17min. 18 1-5sec.

FURIOUS DRIVING CASES.

At the High-Bailiff's Court in Douglas, Isle of Man last week, Mr. Henry Brackenridge, manager of the Motor-Car Company, was charged under the new Light Locomotives Act with running a motor-car along a street in Douglas at a higher rate than six miles an hour. The suit had been brought in the name of the Highway Board, but was altered to the name of Superintendent Boyd, the offence having been committed out of the jurisdiction of the Board. P.C. Acheson said that at twenty minutes to seven in the evening he saw the defendant driving down Victoria Street at a rate of ten or twelve miles an hour. He slackened speed when opposite the Shakespere Hotel. There was not much traffic at the time in the street. The defendant said he had no recollection of the occurrence, but it was probably correct what the constable said. He considered he should have been informed of the complaint at the time. Mr. Creer said that the constable could not run after the car. He did not press for a heavy fine, it being the first case under the Act. A penalty of five shillings and fees, or six days' imprisonment, was imposed.

Before the Eastbourne Borough Bench, the other day, David Charles McCann, an American visitor, was summoned for driving a motor tricycle on the Grand Parade, Eastbourne, at a furious rate. Chief Constable Plumb stated that he was on the Grand Parade, at the top of Victoria Place, at eight o'clock in the evening of the day named. He saw the defendant driving a motor tricycle up the parade at a most furious rate. He stopped opposite Devonshire Place, and witness then went to him, told him that such furious driving was not allowed, and took his name and address. Defendant was driving at about twenty miles an hour, and the machine made such a dreadful noise that it frightened a horse that was being driven on the Parade. In consequence of so many complaints being made to him witness again saw defendant on Wednesday night, and told him he should not allow him to use the machine in the streets again, and defendant promised not to do so. Defendant pleaded that he committed the offence in ignorance, as he did not know the laws of England. The Chairman said the magistrates were determined to put a stop to such machines being ridden at a furious rate. He would be fined 32s. in all.

THE Universal Motor-Carriage and Cycle Co., Ltd., London, E.C., is being voluntarily wound up.

MR. R. E. CROMPTON sailed for the front by the "Canada" from Southampton on Saturday.

THE young ladies of the Thompsonville (Conn., U.S.A.) High School having discussed the proposition "That the automobile is more useful than the bicycle" have decided in the affirmative by a large majority. What will become of the bicycle now?

A dinner of the Automobile Club will be held at the Agricultural Hall on Saturday evening, when non-members will be welcome as guests. The Right Hon. the Lord Justice Clerk of Scotland will read a paper on "War and Power Traction."

THE committee of the Midland Cycling and Athletic Club have decided, as an experiment, to include a one mile open motor-tricycle handicap for nominal value prizes at the first evening meeting at Aston, on Wednesday, May 9th.

MR. C. CLIFFORD POTIER, proprietor of the Service Motor Co., 292, High Holborn, London, W.C., informs us that he has taken extensive store-rooms and workshops at Sutton, Surrey, and that on and after the 24th inst. his business will be entirely carried on at Sutton.

COMMENTS.

THE event of which so much has been heard in the automobile world for months past—the 1,000-mile Trial—is now in progress, and naturally our space this week is largely devoted to an account of some of the performances of the competing vehicles. On Saturday last the bulk of the cars put in an appearance at the Agricultural Hall, and were subjected to a minute inspection at the hands of the judges. All day the cars were the centre of attraction to visitors to the exhibition, they being particularly interested in the operations of the owners and drivers, many of whom devoted almost the entire day to making little adjustments to the cars ready for the start on Monday morning. Elsewhere accounts are given of the start from Grosvenor Place and of the tour from London to Bristol on Monday, and from the latter city to Birmingham on Wednesday, together with reports from observers at some of the leading places passed through. At Bristol and Birmingham day exhibitions of the Trial cars were held, these being largely visited by country people and others interested in the latest method of locomotion. This morning an early start is to be made for Manchester, and should the fine weather of the past week continue there is every probability of the whole Trial proving a great success.

Sir Francis Jeune on Automobiles.

THE exhibition at the Agricultural Hall closed in a pleasant fashion, the Automobile Club holding a house dinner, over which the Right Hon. Sir Francis Jeune presided. His lordship made a splendid speech—one of the best we have ever heard on the subject of automobilism. He referred to the threefold aspect in which the matter might be considered—the healthy interests associated with the sport, its commercial utility, and the development of a great industry. From that he went on to dilate on its pleasures, and the expansive influence it had upon the minds of even those whose love for the country and country landscape was all too latent. Who would have dreamt, said the speaker, that living out in a country place, say, ten miles from a railway, one could pay a visit to a friend thirty miles away, lunch, and get back home to a cosy little tea, and a pleasant evening after—all in the same day? That was what automobilism enabled them to do in the way of sociability. He had had a tiring journey some time ago by train from London to Doncaster—trains were very wearisome at times—and his fellow-passenger, towards the end of the long journey, and not till then, evinced an evident desire to speak to him, but for some reason did not do so at once. At last he said, "There is a wide expanse of land this way, sir," a remark which he (Sir Francis) thought seemed to border on the obvious. His view was restricted by the conditions of railway travelling. It required a tour by motor-car to reveal the glories of the country.

War and Power Traction.

ELSEWHERE we publish practically the whole of the paper read after the dinner. It is really a valuable contribution to the study of automobilism and warfare, and had time permitted a useful discussion might have resulted. But time was limited, and after a few words from Major Holden, Sir M. Clark, Mr. Muirhead, and Colonel Magrath, in proposing and supporting a vote of thanks to the Lord Justice Clerk of Scotland for his able paper, the debate was adjourned.

Educating Horses.

IN addition to the usual qualifications of horses they are now expected to be guaranteed as to their good behaviour in the presence of motor-vehicles. Horse buyers should insist on that point, especially as automobilists are extremely willing to give facilities for the education of horses. Mr. H. Broadhurst, 75, West Hill, St. Leonards, has made a good suggestion for the benefit of the people of Hastings to which we give extended publicity. He says: "As motor-cars are likely to become more numerous in the future, and nearly all seaside towns have been running them for public hire—I would mention Bournemouth, Worthing, Brighton, Eastbourne, Folkestone, Lowestoft, and many others—I fear horses will have to get used to them. I would suggest that if sufficient support will come forward to defray the expense, I will have a motor-car in some suitable place, where horses may be sent to be trained to take no notice of it. People may send their own coachmen, or I will have a qualified man to ride or drive them. I think, after a few lessons and kind treatment, they would take no more notice of them than they now do of bicycles. Everyone on selling his horses likes to say they are not afraid of motors."

A Norwich Offer.

AT Norwich, too, horse owners are to have an opportunity of accustoming their horses to the automobile, for Messrs. Hayes, Thompson, and Kahler of that town have written to the local paper stating that they are willing to use either of their cars for a short period any morning before eleven o'clock for the purpose of educating or accustoming horses to them. They add: "Usually one or two lessons, such as allowing a horse to look at and walk around a car whilst at rest, then whilst a motor is at work, and finally to run the car round the animal, will teach any horse that a motor-car is nothing to be afraid of. Horses are possessed of such intelligence that, given a fair opportunity, they will quickly find this out for themselves."

Touring in Northern Africa.

THERE would appear to be quite a rage for automobile touring in the French colonies of Northern Africa, for in addition to the voyages made of late by Baron Pierre de Crawhez and M. Arch-deacon, not to mention the names of many less notable *chauffeurs*, no less a personage than the Prince d'Orleans has recently been indulging in long drives on African

soil, and from the times recorded it would seem that in Tunis, the scene of his exploits, the roads are considerably better than those of Algeria, over which the previously named automobilists had driven. The Prince, accompanied by the Comte de Brettes, was driving a 12 h.p. car, and after leaving Tunis he travelled by way of Sousse and Sfax to Kairouan, so gaining the distinction of being the first automobilist to make the journey. The 140 kilomètres (87½ miles) separating Tunis from Sousse was effected in three and a-half hours, representing an average speed of 40 kilomètres (25 miles) per hour, while this performance was excelled on the return journey from Sfax to Tunis when the 294 kilomètres (183¾ miles) between the two towns were covered in seven hours, or at the rate of 42 kilomètres (26½ miles) per hour. When such performances can be achieved there cannot be anything very radically wrong with the condition of the roads, and Algerian tourists might do worse than make a few excursions in the sister colony.

Municipal Authorities and Motor-Vehicles.

THE step taken by the Chelsea and several other vestries in the London district in adopting motor-wagons is being watched by the Kensington Vestry, whose Wharves and Plant Committee is, however, not yet prepared to recommend the adoption of mechanical traction for carrying out the work of the parish. The experiments now being made by other public

MR. E. J. COLES PERFORMING IN THE ARENA AT THE AGRICULTURAL HALL.

authorities are, however, to be closely watched, with a view to future action if successful.

Touring in Wales and the West.

THE "Contour" road maps are recognised by automobilists as essential to the pleasures of motoring, and the new volume covering Wales, the Midlands, and the south-west counties is quite up to the standard. The total mileage of the roads "contoured" in this handy little book is 9,500, and the descriptions, gradients, and measurements have been supplied from original sources, the information being obtained personally by Mr. Harry R. G. Inglis in a survey of each district. The volume is published by Messrs. Gall and Inglis, and contains 500 maps and plans. The whole area covered by the book has delightful scenery, and some of the roads are of the steepest. Fortunately the main roads are excellent; otherwise cyclists and motorists would probably be compelled to leave much of the district alone. Nine English cathedrals and half a dozen Welsh castles are included in the itinerary.

A Projected Trans-American Highway.

THE Automobile Club of America held its first dinner on April 2nd in New York. The special object of the occasion was to start the agitation for a trans-continental highway. About a hundred persons were present, and resolutions were adopted which began by proposing a route from Portland (Me.), through Boston, Albany, Syracuse, Rochester, Buffalo, Niagara Falls, Erie (Pa.), Cleveland and Toledo (O.), Adrian and Coldwater (Mich.), Elkhart and South Bend (Ind.), Chicago, Davenport, Des Moines and Council Bluffs (Ia.), Omaha, Lincoln and Hastings (Neb.), Denver, Salt Lake and Sacramento to San Francisco. A southern branch from St. Augustine through Savannah, Charleston, Richmond, Washington, Baltimore, Philadelphia and New York to Albany, and a Pacific Coast branch from Seattle through Portland (Ore.) and San Francisco to Los Angeles was likewise proposed. The resolutions further recommend that the United States Congress be petitioned to authorise a survey of the route named, such survey to be performed in four sections, and if possible within four years, the section between Boston and Chicago the first year, that between Chicago and Omaha the second year, that between New York and St. Augustine the third year, and the remaining portions the fourth year. It was proposed that the expense be met, one-third by Congressional appropriation, one-third by the States for those portions lying within their respective boundaries, and one-third by the counties, towns, and cities through which the road should pass, the owners of the property benefited to be asked to donate the right of way. The need of ample width and of the avoidance of curves, to meet the conditions of automobile travel at high speed, was dwelt upon, and a right of way of 120ft., with road width (for the present) of half that, was recommended. The speeches after the resolutions were adopted dwelt on the benefits of the proposed highway, not to automobilists alone, but to farmers and the countryside in general.

Motor-Cars and Cemetery Walks.

CEMETERIES are now being closed to automobilists in the United States. We do not mean that they may not be buried there; but that they may not pursue their pastime along cemetery walks. At the main entrance to the Forest Hills Cemetery, Boston (Mass.), a notice has been posted to the effect, "Automobiles not allowed in this cemetery," thus placing motor-cars in the same category as dogs and perambulators. Even automobilists, it is complained, who wish to visit their own graves, have to leave their vehicles at the gates and proceed to their destination on foot. Why this should be accounted a hardship we cannot understand. True the automobile is going ahead in this country, but we have never yet seen a motor-car in a burying ground. Possibly the directors of this particular American cemetery have visions of automobile funerals, for which even the most enthusiastic British motorist is not yet prepared.

Lectures on Motor-Cars.

MR. SHRAPNELL SMITH, Mr. J. H. Knight, and other gentlemen have given lectures on automobilism to various societies illustrating their addresses by lantern slides. But for the fact that the War will probably be the only topic likely to draw large audiences during next winter's lecturing season we would have suggested that the extension of the lecture idea would have been a good means of popularising the motor-car. At the New York Athletic Club such a lecture has just been given, and the discourse was followed by a demonstration of electric vehicles in the gymnasium.

PHILADELPHIA is to have an Automobile Club, a provisional committee having just been appointed.

ARRANGEMENTS are in hand at Frankfort-on-the-Main for the holding of a motor-car exhibition during the coming summer.

A FIVE-MILE scratch motor-tricycle race is included in the list of events to be run off on the Catford track on Saturday, the 5th May.

The Automobile Club's 1,000-Mile Trial.

MUCH has been done to demonstrate to the British public the steady, substantial, and safe advance that automobilism has made since Parliament softened the severity of its attitude towards road traction. The tours of isolated motorists, the opposition of local authorities, the long runs of some of the best known enthusiasts, the discussions at the Automobile Club, and the annual trips to Brighton have each had their share in educating the public, while the Commercial Efficiency Trials in connection with the Motor-Car Exhibitions of 1899 played an important part in showing the capability of the modern motor. Such efforts did much; but it has long been felt by ardent automobilists that some greater task organised on a very complete scale would have to be undertaken if a really great impetus was to be given the industry and the sport.

In France and Belgium that filip has been found in racing at fearful speeds along the high roads to the accompaniment of official bands and with the assistance of the police authorities. The result has been the apparent popularisation of the automobile as a means of sport and the development of high-speed cars specially designed for record making. At length the risks have become so great that even the most enthusiastic *chauffeurs* are beginning to wonder as to the utility of it all, and the authorities, becoming alarmed, have decided to curb the pace of the daring riders. Fortunately in England no such venturesomeness has manifested itself; the organisations which are specially concerned with motor-car matters have wisely dis-
countenanced road racing, and although there may be a few

THE 1,000-MILE TRIAL CARS IN THE ARENA AT THE AGRICULTURAL HALL ON SATURDAY LAST.

foolish people who regard high speed as the only possible delight when motoring, it cannot be denied that the great majority of motorists are satisfied, as Sir Francis Jeune well remarked at the Automobile Club's dinner last Saturday, with the view of the country as seen from the motor-car travelling at a fair and reasonable pace.

Bearing this in mind, the Automobile Club decided to organise a tour upon lines which would be most likely to appeal to the practical character of the British people. It was to test the temper, patience, and skill of the drivers, no less than the construction and design of the cars taking part in the test. Instead of great speed over specially selected roads of an uniformly level surface, it was intended to show that the cars could successfully make daily runs aggregating 1,000 miles in a certain number of days. A car which could go through such a trial should be more suited

for ordinary pleasure or commercial purposes than one designed merely for speed. Thanks to the enterprise of the manufacturers and agents engaged in the automobile industry in this country, and also to the sacrifice of time and money on the part of several private owners, the organisation of such a Trial has been possible, and on Monday it commenced. Out of eighty-four motor-vehicles, including tricycles, which had been entered no fewer than sixty-four actually started. A variety of circumstances must be held responsible for the absence of the remaining score, the most regrettable being the serious accident which happened to M. Déchamps, on the road between Brussels and Antwerp, last Friday night. He was bringing his car to England for the Trial, but owing to an accident which resulted in smashing up the car and rendering M. Déchamps unconscious, the entry had to be cancelled.

In the pages which follow we chronicle the doings in connection with the Trial up to yesterday (Thursday) in a series of contributions dealing with the scene at starting, the chronicle of a correspondent taking part in the Trial, the reception at the leading towns, the various exhibitions and the journey as far as Birmingham, together with many interesting experiences and incidents on the way. Next week the same method of recording the Trial will be developed and amplified, so that our issues during May will form a complete record of the greatest event in the automobile world during the present century, thus fittingly preparing the way for the automobile industry to become a permanent and progressive British business in the era which will shortly begin.

THE ITINERARY.

In order that readers may conveniently follow each day's doings we give an itinerary showing also the places at which exhibitions will be held.

		Miles.
April 23	London to Bristol	118½
" 24	Exhibition at Bristol	
" 25	Bristol to Birmingham	92½
	Three hours' exhibition at Cheltenham	
" 26	Exhibition at Birmingham	
" 27	Birmingham to Manchester	110
	Hill Climbing of Taddington Hill	
" 28	Exhibition at Manchester	
" 30	Manchester to Kendal	73½
	Hill Climbing up Shap Fell	
	Exhibition in the evening	
May 1	Kendal to Carlisle	61½
	Hill Climbing on Dunmail Raise	
	Exhibition in the evening	
" 2	Carlisle to Edinburgh	100
	Hill-climbing on Birkhill	
" 3	Exhibition at Edinburgh	
" 4	Edinburgh to Newcastle-on-Tyne	121½
" 5	Exhibition at Newcastle	
" 7	Newcastle to Leeds	103
	One hour exhibition at York	
" 8	Exhibition at Leeds	
" 9	Leeds to Sheffield	74
	Three-hour exhibition at Bradford	
" 10	Exhibition at Sheffield	
" 11	Sheffield to Nottingham	82½
	Racing in Welbeck Park	
	Two hours' exhibition at Lincoln	
	Evening exhibition at Nottingham	
" 12	Nottingham to London	123½
	Vehicles proceed to the Crystal Palace	
" 12-19	Exhibition at Crystal Palace	
	Total	1,060

THE START.

BY AN OCCASIONAL EARLY RISER.

ENERGY and early rising are characteristic of the motor-car and the motorist alike. Such was my reflection on arriving at Grosvenor Place shortly after six on Monday morning. I found a score of enthusiasts were already there, and cars were arriving simultaneously with the morning milk. The morning was rather dull, and a chilliness was in the air—not the chilliness that comes upon us at night, but that curious condition associated with unaired things—whether clothes or thoroughfares. Policemen were less stolid than usual, workmen lingered on their way to work, and milkmen glanced from the housemaids on the one side to the curiously-garbed creatures formed into chatty groups on the other. It was a sight such as is not often seen. In fact, it has never occurred before, and only early risers are destined to see such an affair in the future.

It was evident something unusual was about to take place. Sandwichmen stood in the gutter bearing aloft banners—journalistic licence thus honours the commonplace boards of the advertiser—with the device “Class A,” “Class B,” and so on through the first five letters of the alphabet. Close scrutiny revealed the fact that these letters were duplicated, and that each bore a further reference to Section I. or Section II. On the pavement chalk marks were being made to indicate the positions to be assumed by the cars on their arrival, and from six to seven Mr. Lyons Sampson, Mr. H. J. Mulliner, Mr. C. Johnson, and other officials had a busy time in seeing that proper positions were occupied. Apart from the cars the greatest interest was taken in the raiment worn by the intending passengers, of whom there were about 200, with almost as many varieties of clothing, for certainly no two complete suits were alike. The headgear was equally varied and distinctive. One gentleman seemed to have distorted a flat piece of felt into some form resembling a cross between a billycock and a pie-dish, and was content. Others wore fishermen’s caps; the majority were seen under leather caps of different shapes and styles, and only a few kept to the ordinary bowler. As to jackets, they ranged from leather to fur and back again, in varying gradations, from fur to leather. Evidently there is no correct “fashion” in automobile attire, and even the Frenchmen who came over as though prepared to journey to the North Pole did not wholly satisfy the popular fancy. Altogether it was a kaleidoscopic scene, as the strangely-attired persons flitted about from one car to another, full of interest. Of course, all the prominent motorists of the country were there. Among amateurs the Hon. J. Scott Montagu, M.P., and the Hon. C. S. Rolls were recognised by the crowd, while a little crowd gathered around Captain Langrishe on Mr. Alfred Harmsworth’s Daimler. Messrs. J. A. Holder, J. Hargreaves, J. D. Siddeley, C. K. Gregson, C. Cordingley, E. Pitman, H. Edmunds, R. E. Phillips, and T. B. Browne were early astir, as was also Mr. S. F. Edge, who was to drive Mr. Kennard’s 8-h.p. Napier, and Mr. Frank H. Butler, the hon. treasurer of the Automobile Club, on his new 6-h.p. Panhard, having his daughter as one of the passengers. There were only a few ladies about, Mrs. Mann and Mrs. Friswell, with their respective husbands, and Mrs. Bazalgette, on her own car, being the best known.

Right up to the stroke of seven cars were arriving, one electric cab having specially honoured the occasion with its presence reminiscent of a score of others seen on London streets some months ago. Cyclists were plentiful and policemen polite, with the result that a clear way was made for the cars, which made a good show as they went round the corner of St. George’s Hospital. However new and novel may have been the appearance of the cars to the general public, the majority were all familiar to those who have faithfully followed the pages of this journal. So far as I could see, the only vehicles that started, and which had not previously been illustrated and described in these columns, were the new Georges Richard car, the Daimler public service char-à-banc (the latter having one of the few ladies taking part in the tour for a passenger), and the S. S. car, which had been kept as a kind of “dark horse”—another journalistic licence. Elsewhere in these columns this week will be found illustra-

tions of the former vehicle, while the momentary glance I had of the S. S. Motor Company’s vehicle on its arrival at Grosvenor Place showed that it was a four-seated car, fitted with wheel-steering and detachable body. The engine is a single cylinder one of 5½-h.p., the transmission being effected by gear wheels. The vehicle is fitted with three speeds forward—4, 10, and 20 miles per hour—and reverse motion.

Standing at the corner of St. George’s Hospital, and closely wedged between a full round policeman and a fair cyclist, I saw only the cars as they sped by. First came Mr. Hewetson on his Benz; then Mr. Coles, even more at home on the road than on the stage; then, in rapid succession, came the rest of the vehicles in Class A, the only non-starter being the Humber voiturette and one of the New Orleans cars, which, however, strolled along later and made a good start all to itself. With only a minute’s interval between, Class B followed the first fleet, and here the Princess cars and the Ariel Panhard voiturette were missing, the new S. S. carriage, the Renault cars (known in this country as the M.C.C. Triumphs), De Dion voiturettes, and the Wolseley and the Marshall cars—the latter driven by Mr. J. J. Mann—forming the rest of the contingent. Class C came along well, and proved one of the most attractive sections to the public, the number of passengers carried by most of the vehicles demonstrating the practical nature of the section. Mr. A. Burgess drove the Motor Manufacturing Company’s 6 h.p. phaeton, and was closely followed by the Brown-Whitney steam car, which had attracted much attention during the exhibition at the Agricultural Hall. Hardly had I saluted Mr. Albert Brown and Mr. Banks, who were aboard, when some well-known cars rounded the corner almost together, only allowing one to recognise such well-known faces as those of Messrs. Friswell, Critchley, Pedley, and Richardson, all apparently setting out on their long pilgrimage with lightness of heart and ease of mind. The cheerfulness of the passengers was, in fact, very noticeable—a condition probably based on the thorough overhauling of the cars which had taken place in the preceding hours. So anxious were the owners of cars to have everything in a perfect state for the start, that some had stayed up through a good many hours of the night attending to mechanism and generally looking to their cars. Such devotion deserves success.

Alas! for the curiosity of the public. It overwhelmed several journalists on Monday morning, and despite the way in which the police backed on to frail toes and smiled pleasantly if caught in the act, the crowd pushed outward from the kerb. I lost the protection afforded by the cycle of the spectator already referred to, and while engaged in preserving equilibrium missed some of the quadricycles and tricycles that I had seen standing idly in Grosvenor Place half an hour before. I did not, however, miss the Daimler public service vehicle driven by Mr. Straker. Then followed in rapid procession the privately-owned vehicles whose owners have already been mentioned, Mr. Grimshaw driving the Daimler car of Mr. Hargreaves, and Mr. Johnson being in charge of the wheel on Mr. Exe’s phaeton.

The long procession, which had only taken twenty minutes in passing, was brought to an end by Messrs. A. J. Wilson, H. Ashby, and E. M. Iliffe, the two former on tricycles and the latter on an Enfield quadricycle. One notable motorist was absent, and I turned round into Grosvenor Place to see if any laggards were about. There was the wagonette of the Thames Valley Motor-Car Company full of baggage, and suddenly Mr. Mark Mayhew, L.C.C., came into view. He was rather late, but he was going well, and seemed likely to quickly overtake some of the earlier starters. After I had left the scene, yet another competitor appears to have put in an appearance and to have gone on the journey to Bristol.

Several vehicles were about which intended to go part of the way, these including the Delahaye; but Dr. Lehwess and Mr. Weigel were the most prominent on their Vallée racer, which doubtless regarded the course as rather tame. And when the cars had gone the crowd dispersed to its work, having had a new education and an object lesson in what will, in a few years, be regarded as quite commonplace, viz., the advantages of motor traction over horses. Not a car “jibbed” at the start; every vehicle went off at the word of command, and it was clearly

demonstrated that if the motor-vehicle has come to stay, it has also come to go.

The following is a complete list of the cars that started from Grosvenor Place:—

SECTION I. (Cars entered by Manufacturer or Agent.)		Class F. 38	Daimler Public Service Vehicle
SECTION II. (Privately owned Vehicles.)			
Class A.		Class A.	
1 Benz Ideal		A25	Benz Ideal (Mrs. Bazalgette)
2 Benz Ideal			
5 Locomobile Steam Car		Class B.	
16 Gladiator Voiturette		A24	Mors Voiturette (Mr. Phillips)
18 Endurance Car			
19 Orient Express		Class C.	
27 New Orleans Car		A2	6 h.p. Panhard (Mr. Butler)
28 New Orleans Car		A3	6 h.p. Panhard (Mr. T. B. Browne)
29 Eureka Car		A7	6 h.p. Daimler (Mr. A. Harmsworth)
30 Eureka Car		A10	8 h.p. Napier (Mr. E. Kennard)
33 Décauville		A12	6 h.p. Daimler (Mr. H. Edmunds)
34 Décauville		A21	6 h.p. Daimler (Mr. E. Pitman)
42 3½ h.p. "Hurlingham"		A23	6½ h.p. Motor Mfg. Co.'s Phaeton (Mr. C. Cordingley)
41 International Victoria		A26	6 h.p. Daimler (Mr. C. K. Gregson)
44 International Victoria		A30	6 h.p. Daimler (Mr. J. D. Siddeley)
51 Star Voiturette		A31	6 h.p. Daimler (Mr. W. Exe)
52 Roots and Venables			
Class B.		Class D.	
14 De Dion Voiturette		A4	8 h.p. Panhard (Mr. Mark Mayhew)
15 De Dion Voiturette		A11	12 h.p. Daimler (Hon. J. S. Montagu, M.P.)
24 Marshall Carriage		A17	12 h.p. Panhard (Hon. C. S. Rolls)
31 M.C.C. Triumph		A22	12 h.p. Daimler (Mr. J. A. Holder)
32 M.C.C. Triumph		A27	11 h.p. Daimler (Mr. J. Hargreaves)
40 Wolseley Voiturette		A29	7 h.p. Peugeot (Mr. Mark Mayhew)
45 S. S. Carriage			
49 Marshall Carriage		Cl. E. (a)	
Class C.		A16	Ariel Tricycle (Mr. A. J. Wilson)
8 M. M. Co.'s 6 h.p. Phaeton		A20	Empress Motor Tricycle (Mr. H. Ashby)
9 M. M. Co.'s Iveagh Phaeton			
23 Brown-Whitney Steam Car		Cl. E. (b)	
26 8 h.p. Peugeot (Friswell's)		A28	Enfield Quadricycle (Mr. E. M. Iliffe)
35 6 h.p. Daimler			
36 6 h.p. Daimler			
37 Daimler Parisian			
43 L. M. V. and Wagon Co.'s Phaeton, 5½ h.p.			
46 Richard Car			
47 Richard Car			
Class D.			
17 16 h.p. Napier			
21 Lanchester Carriage			
22 Lanchester Carriage

20 Simms' Motor Wheel			
Cl. E. (b)			
3 Ariel Quadricycle			
4 Ariel Tricycle with Whippet attachment			

ultimately finding the hare-like cars stationary by the roadside, their passengers attempting to play the part of the philosopher while waiting for the repair of a punctured tire—or something equally annoying. One driver was seen calmly smoking his cigar while the axle of his car cooled after firing.

If I were asked for the dominant feature of the ride from London to here I should say, "Dust." It was everywhere, and we got more like millers as the day was gone through, until rain came after passing through Bath.

Leaving Hounslow we quickly came upon a "Star" car by the wayside, and soon after passed a second vehicle. Between

ON THE LONG PILGRIMAGE.

BY OBSERVER.

BRISTOL, MONDAY.

AFTER a busy day one hardly feels in the humour of sitting down and detailing the incidents that have made St. George's Day, 1900, memorable in the annals of automobilism. There has been plenty to interest those who have had the good fortune to be members of the pilgrimage, but to give a connected story of what Mr. Mark Mayhew calls a "drive" would be well-nigh impossible. The cars have passed and repassed all day, reminding us very much of the fable of the hare and the tortoise, the occupants of the swiftly travelling cars smiling on those whose vehicles were of slower progress as they went ahead. But these tortoises have often been able to laugh in return as they have steadily pursued their way,

the thirteenth and fourteenth milestone the "Endurance" car was left behind, and before another two miles had been covered saw two "Eurekas" and a "Decauville" returning to town. Mr. A. J. Wilson then went ahead on his motor-tricycle, and I had the road practically to myself—save, of course, for the occupants of my car—until a level crossing was reached, where, owing to the gates being shut, eight other vehicles were grouped. Starting very well together a veritable cloud of dust was caused—such a cloud as could be seen, felt, and chewed. It tickled one's eyes, settled on the tongue, and clung with glue-like tenaciousness to one's garments. Even the most highly polished leather suits received

a whitened and chastened gloss, while fur coats and jackets became heavy with dust and sand. But that is one of the delights and novelties of motoring on a fine day on a good hard road. And so on till Colnbrook was reached, when the merry group broke up and each car became concerned only with its individual performances.

So far the appearance of the roads had been quite as interesting to the travellers by motor-car as mere sightseers on foot. The whole countryside seemed to have turned out, and men, women, and children cheered the vehicles as they sped by. Evidently public interest had been fully aroused, and as much attention was given to the costumes as the cars. Before entering Slough two more cars were descried resting by the way, and the Twin Daimler of Mr. J. A. Hargreaves, driven by Mr. Grimshaw, was passed. As we neared the town several cars came into view, and just beyond Slough our car came up with the Daimler char-à-banc, having passed a De Dion voiturette and a Benz car while the Twin Daimler had gone ahead. Arrived at the toll-gate, Maidenhead, about a dozen cars were waiting to pass through, and Mr. C. Johnson came up driving a Parisian Daimler. In passing through this pleasant riverside town the wisdom of limiting speed was seen, as the cattle which happened to be about seemed rather restless at the approach of our cars. Shortly after leaving Maidenhead Mr. Jarrott went to the front, and Mrs. Bazalgette, the only lady entrant, came along. The Wolseley car, stationary in the road with a chain off, was an object of much solicitude. Going ahead of the Twin Daimler we passed Mr. Herbert Ashby on his Empress motor-tricycle on the thirtieth milestone, and then the Twin repassed us, and was seen no more till we got to Bristol in the evening. In the town of Reading two of the M.C.C. Triumphs were seen, but breakfast was ahead, and few stayed to inquire how they were getting on. From Reading the trip to Calcot Park was short and enjoyable, and there Mr. Alfred Harmsworth royally entertained his fellow automobilists. Leaving Mr. Harmsworth, the cars had a straight run to Newbury, from whence a clear eight miles spin took us to Hungerford, where the hilly roads became noticeable, the roads up to that point having been fairly level. About eight miles from Reading the new vulcanised flat rim of the driving wheel of Mr. C. Cordingley's new car split, with the result that he had to return to Reading on the first speed. The tire being vulcanised on to the rim it was, of course, impossible to repair it on the road, and he had to return, ultimately getting to Bristol by train. Offers of assistance were made—but all, unfortunately, were unavailing.

By way of Beekhampton, Calne, Chippenham, and Bath we proceeded to Bristol, where cheering crowds welcomed the dusty motorists.

BIRMINGHAM, Wednesday.

More than fifty cars left Bristol for the second day's journey on Wednesday, and although rumours had been frequent as to the obstructive tactics being pursued by the police, it was quickly seen that nothing of the kind was intended, and we were all glad to find the authorities recognise the caution with which the Trial was being got through. On the way several stiff hills were encountered and some very fine performances were made, the New Orleans voiturette going extremely well. The morning was cold and grey, the sky betokening rain, and collars being almost universally turned up. Getting into the country lanes trouble was experienced on many cars owing to difficulties with the lamps, that on my car giving trouble for two hours—trouble and nothing else. The general difficulties were, it was suggested, owing to the inferior quality of the petrol obtained on the way. At Thornbury the Daimler char-à-banc broke one of its burners and passed us completing the journey to Cheltenham on a single cylinder. Incidents, however, were few, and save for missing breakfast at Gloucester the run into Cheltenham was uneventful. There, however, was a warm welcome and successful exhibition in a fine building which does credit to the town. The motorists left Cheltenham in fine style. Great delay, however, took place at the controls, and those townsfolk who had ventured thus far saw an exhibit of cars lining the road. We had a fine run to Worcester, the roads being in splendid condition. In fact, that has been one of the characteristics of the trip so far. The

result was seen in the fact that forty of the cars reached the city in the "control" time. There Mr. Alfred Bird joined the party. There was hardly time for tea at Worcester, through which city we passed with difficulty. This place was more crowded than any on the journey, and the enthusiasm was great. Unfortunately the tire on Mr. Hargreaves's car came off here. Resuming the journey to Birmingham, the air became colder and colder, and leathers, oilskins, furs, and other clothing were very necessary indeed.

SOME EXPERIENCES.

A Costly Trip.

MOTOR-CAR trials extending over 1,000 miles cannot be performed without financial resources. There are more than sixty vehicles engaged—representing a value of considerably over £20,000. So much for the first cost; then drivers have to be paid and lodged for three weeks; there are 200 passengers, whose expenses will probably be, at a minimum, 30s. each, a total of £300 a day, although £400 would be nearer the mark. So that in twenty days their expenses should total about £8,000. Add to this the wages, hotel expenses, etc., of mechanics, which will not be far short of £500 during the three weeks. Stabling, petrol, repairs, etc., have to be added, to say nothing of the time of business men. Hotel-keepers should welcome a repetition of the event at an early date, for such enterprises will materially increase their revenue between seasons.

Hodge Surprised.

THE first day's journey was entirely through agricultural districts, Reading being the only centre of real industrial importance passed through. At many points the hedges seemed as thick with faces as with bloom, the labourers leaving their ploughs and watching the passage of the motors with amused interest. At dinner-time in the fields some of the cars had a pleasant reception, the girls who had evidently taken the dinners to the labourers having, in many places, filled their aprons with buttercups and daisies, with which they pelted the travellers. Boys were less considerate; their attentions were chiefly vocal—and may be imagined.

Baggage Cars.

THOSE engaged on the Trial are like an army depending on its mobility for commissariat. There are only two luggage cars going the journey, and both of these are certainly keeping up well. One is heavily laden with the luggage of the Daimler party, and the other is the wagonette of the Thames Valley Motor-car Company, which is in attendance on the passengers of the New Orleans voiturettes. This car apparently carries every luxury of civilisation, even to a silk hat—an object of much curiosity when first seen, and one which led to the hope of a solution of the problem as to how to carry a top hat on a motor-car. This is a problem indeed. We accommodated a friend's bowler on our car, but, alas! for the frailty of bowlers. Its identity is beyond recognition, but it is the same bowler, as we are quite willing to guarantee.

Everyone at Work.

THERE seems a thorough enthusiasm on the part of all engaged in the run to get through without mishap. Not only are the owners, manufacturers, and drivers anxious that everything shall be prepared each morning for a successful run throughout the day, but ordinary passengers are quite as wishful for success. A fine sight it is to see every morning master and man both in overalls working at their cars overhauling every part, and taking every possible care that nothing shall be found faulty during the day's run. This general interest in mechanical details shows how strong is the enthusiasm for the sport.

The Exhilaration of Motoring.

HOTEL-KEEPERS on the line of route will long remember the appetites of those who ventured upon the 1000-mile Trial, as well as the dusty appearance of the travellers. Fastidiousness about looks and great concern for the neatness of one's attire are matters about which the automobilist knows nothing; and while wonder may be expressed at the strangeness of some of the garments, greater wonder would be felt at the sight of a man who ventured on a hundred miles' run in silk hat and frock coat. Although most of the party had been up from six o'clock in the morning till nearly midnight, there had been no complaints of fatigue. The effect of the trip on jaded mortals is as exhilarating as a sea voyage, and those who felt run down at the beginning of the tour should feel remarkably well braced up at its conclusion.

train for Bristol, where he found thirty-six cars had arrived. A complete set of new wheels arrived on Tuesday, and these having been fitted, the car was driven to Bristol and the journey to Birmingham completed on Wednesday in good style.

A Daimler Carries the Standard.

ONE of the 6 h.p. Daimler phaetons was driven by Mr. Percy Richardson, who had with him the Lord Justice Clerk for Scotland, and Colonel Magrath, an engineer, and a correspondent of the *Standard*. Everything went well, and the descent from Savernake Forest (where Mr. Pedley had his memorable drive through the snow) into Marlborough was accomplished with ease. At Marlborough our photographer took the snapshot given elsewhere—in which the gallant Colonel appears 'on guard.' The steep ascents after leaving Chippenham were

THE CARS AT CALCOT PARK (MR. ALFRED HARMSWORTH'S RESIDENCE), NEAR READING.

[Photos, by]

[Mr. W. H. Taylor]

Mr. Cordingley's Car.

ABOUT eight miles from Reading the failure of the tires on the driving-wheels of Mr. C. Cordingley's car led to his return to Reading. Things had been going well when suddenly a loud noise and "bump, bump" they went. The brakes were put on and it was discovered that one of the vulcanised flat rubber tires had come straight away from the rim. At Reading telegrams and messengers were dispatched for a complete set of new wheels, Mr. Cordingley having had quite enough of those upon which he had relied. They were very cool, had not run three hundred miles and yet were in rags, pieces two inches in diameter having been stripped off. Leaving his car at some stables, the owner took

all negotiated with confidence and the only incident occurred at the summit of Rowden Hill. There something connected with the water circulation went wrong, necessitating a stoppage of about an hour. Bristol was, however, reached at 7.10 p.m., only ten minutes after the appointed time.

Wayward No. 9.

PRESSMEN will come to the conclusion that there is something uncanny about the Motor Manufacturing Company's 6 h.p. phaeton "No. 9" in the official list. On that the *Daily Chronicle* representative had intended to journey as far as Carlisle, and Mr. J. H. Gretton, the chairman of the company, was also to be a passenger. Both these gentlemen were early at

Grosvenor Place, but no No. 9 could they see. They saw the last of the cars depart and the crowd disperse to go about its business; they then sought consolation in telephones and telegrams, and, after a while, took train to Reading. No. 9 had not been seen, but a telegram came to hand that it had left Hyde Park at seven o'clock. So, by common cab, they went to Calcot Park, and the first vehicle they saw was No. 9. Its time-sheet showed that it had started at 7.10 a.m., and that punctuality was more to be regarded than pressmen.

Its Character Redeemed.

BUT the character of the car was thoroughly redeemed, as it went from Reading to Bristol without any signs of distress, climbing hills with perfect ease. The thirty-two miles to Marlborough were covered in just under two hours. In all, the journey of 118 miles was performed in well under twelve hours, of which nine were actual running time. No real incidents occurred to call for graphic description, but variety was added to the drive by the way in which this 6 h.p. motor kept up for sixty miles with an 8 h.p. vehicle carrying two fewer passengers.

Hills Surmounted.

NEWSPAPER correspondents have been loud in their praise of the motor-vehicle as a hill-climber, and, whatever they may say as the cars go north, their eulogy has been noteworthy. As one observant Pressman observed, "No hill could have been negotiated by horses as was done by the cars, and no hills could have been descended safely by animals at the rate which the cars came down with ease."

Little Cars Doing Well.

WHILE the success of the larger cars was freely anticipated there were misgivings as to some of the smaller ones that had entered; but up to Wednesday many of the little cars had done exceedingly well, and were "going strong." One car, belonging to Mr. Moffatt Ford and driven by a little French lad with an equally diminutive companion aboard, has been particularly noticeable. The nonchalant way in which the little fellows lean back perfectly at ease in what appears an animated bath chair is simply delightful, and they know how to manipulate the car quite as well as older and larger motorists, turning up betimes at the controls. At the same time it must not be overlooked that a few of the small cars were running somewhat irregularly on the first two day's runs. Probably they will settle down as the trip progresses.

On a Richard Car.

A PASSENGER on the 5 h.p. Richard car, driven by M. Bertin, records that the baptism of dust was undergone about a mile from Hounslow. At Calcot Park he arrived fifty minutes in advance of the appointed time, being third or fourth to put in an appearance. Newbury was reached at noon, and Marlborough afforded the opportunity for luncheon. The long descent of Box Hill was done in good style, and everything promised well until, two miles from Bath, the leather driving band became torn and an hour's stoppage was the result. Other cars passed in irritating fashion; but, once started again, the Richard car made good progress, and reached the ancient city of springs about half way in the procession of vehicles. Tea having been taken, the run was continued and Bristol was reached in good time.

Pneumatic and Solid Tires.

VERY remarkable is the success attending the cars fitted with pneumatic tires. There are a large number of vehicles so provided, and they are going along splendidly. Certainly some of the cars whose wheels are shod with solid tires have envious passengers.

Miss Bacon's Mishap.

MISS BACON on her Werner bicycle was one of the first arrivals at Grosvenor Place on Monday, and was the first to reach Calcot Park. About half an hour's run from there, however, she came to grief, and reached Bristol by train late at night, her machine having been smashed on the Great Western Railway between Reading and Swindon Junction. Her battery gave out about two and a-half miles after leaving Calcot Park, so the lady rider pedalled back to Reading, and took the 2.25 train for Bristol. She paid 4s. for the carriage of her motor-bicycle, and got into the guard's van to take care of it, but the officials objected to her being in the van, and she got out at the next station. At Swindon Junction, where she had to change trains, the bicycle was handed to her with the lubricator broken, and it was supposed that on going round the curves into the station the machine was thrown down. But for the breaking of the lubricator a new accumulator could have been obtained at Bristol, and the journey continued.

The Daimler Parisian.

ONE who had never before been on a motor vehicle drove on the Daimler Parisian with Mr. G. F. Pedley from Gloucester to Cheltenham, and had his preconceived notions as to the vibration and perfume attached to automobilism quite exploded. He writes:—"The vibration which one fears so much on seeing the car standing still is entirely lost as soon as the start is made, and when a fair speed is attained nothing can exceed the smoothness with which the car runs. There is also very little smell, and in the hands of such a capable driver as Mr. Pedley the motor seems almost perfection. Of course the speed the "Parisian" attained on her run from Gloucester to Cheltenham was limited to regulations, but once or twice she fairly flew along, giving one a good idea of her capabilities. Loaded as she was with three passengers and a quantity of baggage her performance was first-class, and she has so far run the tour through without the slightest mishap."

The Steam Cars.

OUR American readers will be interested to learn that the Stanley car is going on alright, although suffering from constant tire punctures. The Brown-Whitney car, too, has made steady progress.

Photographs.

SCORES of photographs have been taken, both from and of the cars and passengers. Unfortunately the light at the start for Grosvenor Place was so bad that our photographers, who were stationed on an overlooking balcony at Hyde Park Corner, did not get a satisfactory picture of the commencement of the trip. Mr. Argent Archer, however, was more successful, and took a couple of interesting views, which, however, reached us too late for reproduction. Mr. Archer is accompanying the vehicles, and will probably have a splendid set of photographs as a souvenir of this important trip.

On a New Orleans Voiturette.

ONE of the New Orleans cars started very late on Monday and was a bit behind in getting forward on Wednesday morning. But it made capital runs and went from Bristol to Cheltenham without a stop, overtaking seven other cars which had started an hour earlier. It covered the distance of 42 miles in three and a-half hours, or at the average speed of 12 miles an hour, one noteworthy characteristic being that most of the passing of other cars was done on the hills, which the voiturette took with ease, winning the praise of those on other cars, as well as proving satisfactory to its own passengers.

Almost Together.

learn that the English-built car ran splendidly all the way—as did that of French make.

Travellers' Tales.

MANY have been the stories told in the hotels each evening, and some of the yarns will attain considerable dimensions before Edinburgh is reached. One neat little story we heard was that of a fly-wheel falling off from the car going down hill and careering along ahead of the car "on its own." Another was that of an innocent pressman on a local paper who mounted a petrol car and asked where the electricity was stored. Many such anecdotes have been told over supper, and would form interesting reading could a complete collection be obtained.

Motor-Wheels and Tram Lines.

SIMMS' motor-wheel has no particular liking for tram lines, and apparently a deeply rooted antipathy to such common matters is a characteristic feature. Certainly the driver had an exciting time. At Bath the machine skidded on a tram line and turned completely over, the driver being thrown off. Fortunately the mechanism was only slightly damaged and the driver was able to put things right and continue his journey on the fine road leading into Bristol. But there again the tram lines brought him low, for the car turned completely over again, owing to the presence of a flanged tram line. He was, however, able to set up his machine again and reached the Drill Hall in time to secure the club certificate for having attained the legal speed of twelve miles an hour.

Provincial Exhibition.

ON Tuesday we had a five minutes' chat with Dr. Lehweß, of the Automobile Association, who had spent the previous day on his Vallée racing car, with which he and Mr. Weigel had gone to Bristol. He was apparently well satisfied with the exhibition last week, not only with the arrangements made on behalf of exhibitors, but also with the business done by his association. So far as the provincial exhibitions about to be held are concerned he does not anticipate any of the exhibitors will do much business—although full of confidence as to the value of the Trial, in proving helpful to the automobile movement generally.

Pigeons and Sparrows.

WE had an interesting experience at Hounslow, when we came suddenly upon three pigeons in the road. They evidently did not notice our approach, for they made no attempt to escape. The car passed over them, and they flew out at the rear. Such an experience must have been a novelty to the pigeons. The Hon. Scott Montagu tells us he frequently has similar experience with sparrows, but unfortunately they do not seem to be keen judges of speed, and are frequently knocked down by the hood of his car. Such incidents have been rare this trip, and only one dog has been reported killed.

Climatic Changes.

ONE of the greatest troubles on such a tour is concerned with the rapid changes of weather. These are frequent enough on an April day in one place, but when it is remembered that the journey from London to Bristol is practically 120 miles, and that a day's course on this Trial carries one from the West

to the Midlands, and from the Midlands to the North, the difference is even more noticeable. Thus we start with a dull morning, which seems full of rainy prospects, and as the hours pass get into a warmer atmosphere, until the heat becomes oppressive under great coats at noon. This may be succeeded by a sharp crisp afternoon, and followed by a bitterly cold evening. Such variations have already been seen and felt, and doubtless many more "samples" of British weather will be experienced ere the Trial comes to an end.

MORE SNAPSHOTS AT CALCOT PARK, NEAR READING.

[Photos. by]

[Mr. P. Richardson.]

Late Arrivals.

MR. J. E. HUTTON arrived at Bristol about 10.30 p.m. on Monday night, having travelled straight from London. Unfortunately on entering the Drill Hall his radiator got broken. Another late visitor was Mr. Muhlenkamp, of Brighton, who travelled from Brighton to Bristol via London, on his 6-h.p. M.M.C. "Princess" car. This car certainly went very well. At Bristol a Lanchester car also returned to the ranks, having been taken off the route for some adjustment.

EN ROUTE.

READING.

Evidently automobilists cared more for breakfast than for biscuits, judging by the slight stop which was made. Doubtless the proximity of Calcot House, where Mr. Alfred Harmsworth had promised hospitality, was the cause.* Still they made a brave show, and although unfortunately one car seemed to be in trouble, the general impression made on the townspeople was distinctly good.

MARLBOROUGH.

Marlborough was *en fête* in honour of the automobilists, and the market place was thronged with spectators, inquisitive crowds inspecting the vehicles while their passengers were taking lunch. Particularly curious were the cyclists, many of whom had come from distant Wiltshire towns and villages to see the motor-cars. A very pleasing sight was a number of children, who waved Union Jacks with juvenile energy, whether in honour of St. George's Day or the motor-cars none seemed to know. Among the news brought by the first half-dozen cars was a report as to a defective casting in one of the cars having caused it to give out just before entering the town.

BATH.

The first arrival at Bath was the "Orient Express," and a dozen other cars turned up within the next half-hour. A splendid instance of how completely the cars can be controlled was given by one of the early arrivals, a lady being knocked down by a car, but getting up uninjured—in fact, the car had stopped before the lady reached the ground. In the amateur section, Mr. Ernest Pitman was among the first arrivals. Most of the tricycles came into the city in good style, although one rider coming up the steep above Cleveland Bridge had to make a second attempt, pedalling all the time, before he surmounted it. During the afternoon about half the vehicles passed through Bath. Somehow or other the idea was abroad in the city that the demonstration would take the form of a procession, and apparently some disappointment was felt as the cars came along in twos and threes instead of in regular review order.

BRISTOL.

The most enthusiastic motorist ought to be satisfied with the reception accorded the vehicles in this ancient city. Hundreds of people crowded into the main thoroughfares leading the way to the Drill Hall. The Hon. C. S. Rolls and Mr. E. Kennard were the first arrivals at the Drill Hall, the third car to put in an appearance being a Décauville voiturette. Mr. Herbert Ashby on his "Empress" motor-tricycle, Mr. J. A. Holder on his 12 h.p. Daimler, and the Hon. J. Scott Montagu were in the next batch of arrivals, and between 6 and 7 p.m. twenty-six cars had taken their positions in the hall, all bearing evidence of the dusty roads that had been encountered. The finish of the run of 118 miles was as stiff as anything encountered in the journey, Park Street having a steep gradient, but all the cars seemed to take it very well. According to the official records, twenty-four of the entries in the manufacturers and agents' section completed the entire journey at a speed up to the legal limit of twelve miles an hour. One, a 6 h.p. Daimler, made an average of eleven and a-half miles an hour, and two—the 1 S. S. 5½-h.p. car, and Roots and Venables' 2½ h.p. car—at an average of eleven miles an hour. Shortly before ten o'clock the Brown-Whitney car arrived, having made the journey at an average speed of rather more than nine miles an hour. Among those who joined the party at Bristol was Dr. Stewart Irwin, of Fockington (Glos.), who came on his M.M.C. Panhard dogcart—a splendid vehicle, which recently climbed a hill of 1 in 6, about a mile long, with four passengers aboard. The following is the official list of vehicles completing the journey at a speed up to the legal limit:—

Nos. 1 and 2, Benz "Ideals."

No. 4, "Ariel" tricycle, with Whippet detachable trailer.

No. 5, "Locomobile" steam carriage.

* Our correspondent is mistaken. The official programme only allowed a stop at Reading for the filling in of record sheets.—ED. M.-C. J.

No. 8, Motor Manufacturing Company's 6-h.p. phaeton.
No. 12, Motor Manufacturing Company's tricycle.
Nos. 14 and 15, De Dion voiturettes.
No. 16, Motor Power Company's "Gladiator" voiturette.
No. 19, Automobile Association's "Orient Express."
No. 20, Motor-Carriage Supply Company's "Simms' Motor Wheel."
No. 22, Lanchester Engine Company's 8-h.p. carriage.
No. 26, Friswell's 8-h.p. Peugeot.
No. 27, Burford, Van Toll's 3½-h.p. "New Orleans" car.
Nos. 31 and 32, Motor-Car Company's 3½-h.p. "Triumphs."
No. 34, Motor-Car Company's 3½-h.p. Decauville.
Nos. 35 and 36, The Daimler Company's 6-h.p. cars.
No. 37, The Daimler Company's 6-h.p. Parisian car.
No. 40, Wolseley Company's 3-h.p. voiturette.
No. 43, London Motor Van and Wagon Company's 5½-h.p. phaeton.
No. 44, International Company's 3-h.p. Victoria.
Nos. 46 and 47, Automobile Manufacturing Company's 7-h.p. "Richard."

No. 51, Star Motor Company's 3½-h.p. voiturette.

Privately-owned vehicles did well, eleven obtaining certificates as completing the journey up to the legal limit of twelve miles an hour, two for eleven and a-half miles, one for eleven miles, and one for ten miles an hour, the latter being Mr. Mark Mayhew's 7 h.p. Peugeot, Mr. H. Edmunds' 6 h.p. Daimler, and Mrs. Bazalgette's 3 h.p. Benz "Ideal" respectively. The eleven most successful vehicles were:—

No. A 3, Mr. T. B. Browne's 6-h.p. Panhard.
No. A 7, Mr. Alfred Harmsworth's 6-h.p. Parisian Daimler.
No. A 10, Mr. Edward Kennard's 8-h.p. Napier.
No. A 17, the Hon. C. S. Rolls' 12-h.p. Panhard.
No. A 20, Mr. Herbert Ashby's 2½-h.p. "Empress" tricycle.
No. A 21, Mr. Ernest Pitman's 6-h.p. Daimler.
No. A 22, Mr. J. Holder's 12-h.p. Daimler.
No. A 24, Mr. Robert Phillips's 4-h.p. Mors.
No. A 26, Mr. C. K. Gregson's 6-h.p. Parisian Daimler.
No. A 28, Mr. E. M. Iliffe's 2½-h.p. Enfield quadricycle.
No. A 30, Mr. J. D. Siddeley's 6-h.p. Parisian Daimler.
No. A 31, Mr. Wm. Eke's 6-h.p. Parisian Daimler.

Although one of Mr. Mark Mayhew's cars came in on Monday, that gentleman did not arrive on his Panhard till Tuesday evening.

On Wednesday morning the departure of the cars attracted much attention, and the local committee certainly deserve credit. That Bristol's welcome was appreciated may be gleaned from the telegram sent to the Lord Mayor from Cheltenham on Tuesday, as follows:—

"Cheltenham, 1.57 p.m.

"Automobile Club begs to thank Bristol for courtesy during recent visit."

GLOUCESTER.

In this ancient city great interest had been aroused, and there was considerable commotion in the streets as the vehicles made their way to the Cattle Market, where they were drawn up in the horse stalls while the drivers breakfasted. Never before has such a sight been seen in any cattle market, and many of the leading owners of horses made careful inspection of the cars in their strange and unaccustomed quarters. Very courteous were the police, who made excellent arrangements for directing the way through the city.

CHELTENHAM.

It was really a holiday occasion at Cheltenham, and quite two thousand people had gathered near the Winter Gardens to see the arrival of the cars, which were manipulated with wonderful skill. Certainly a splendid demonstration of controlling power was given, and no fear of mishap seemed anywhere in evidence. Quite as much interest was shown in the departure as in the arrival of the cars, and at three o'clock a local pressman counted fifty-eight vehicles in the departing procession. This was headed by a well-known local medical man, Dr. Fernald, on his motor-tricycle, who thus showed the way out of the pleasant town.

TEWKESBURY.

Tewkesbury and the neighbouring villages were alive with spectators, the country folk being particularly curious to see the cavalcade, and they came in by carriers' carts, on cycles, and by train to see the sight. Covered with dust, and well wrapped up in strange garments, the automobilists presented an amusing appearance, and seemed well within the police regulations, so far as speed is concerned.

WORCESTER.

A stop of a quarter of an hour for tea was allowed in the Cathedral City of Worcester, and the crowd was great indeed. Rarely has such an aggregation of humanity been seen in the

THE EXHIBITIONS.

Bristol.

To the first of the provincial exhibitions held in connection with the Trial the Lord Mayor of Bristol gave his patronage, and the officer commanding the Volunteers granted the use of the Drill Hall. Mr. W. M. Appleton was the local hon. secretary, and, favoured with fine weather, the exhibition proved a great attraction. Both on Monday evening and all day on Tuesday there was a capital attendance, and although some of the exhibitors would have liked to have received the

THE CARS AT MARLBOROUGH.

(Mr. T. Howard Mercer.)

place, and throughout the route through the city the populace had lined the streets in such numbers as hardly to allow the cars space to pass. In fact, the police were the greatest friends possible to the motorists, and to their kindly help the travellers owe much.

BIRMINGHAM

At Droitwich, Bromsgrove, and Lickey End there were great crowds of people assembled, and at Birmingham the police had the utmost difficulty in regulating the traffic for the passage of the automobiles. By eight o'clock more than three-fourths of the vehicles had reached Bingley Hall, among the first dozen cars into Birmingham being the Daimler phaeton driven by Mr. Critchley.

certificates of their performance earlier than was the case, excellent arrangements were made. The scene about the hall on Tuesday morning was one of briskness and bustle, many of the cars being taken from the hall to be cleaned after the dust and showers of the latter stages of the first day's journey. In the evening the band of the 1st V.B. (City of Bristol) Gloucestershire Regiment discoursed an excellent musical programme, and general praise was bestowed on the courtesy and willingness of those in charge of the cars to explain their working and their merits to visitors. Mr. Howard, a member of the Bristol local committee, had his motor phaeton on view, and as this has just done admirable work on Dartmoor, general interest was manifested in the vehicle.

Cheltenham.

At Cheltenham the exhibition was held in the Winter Gardens, under the patronage of the Mayor, with Mr. F. M. Bostock as the local hon. secretary. Although the exhibition only lasted an hour or two, the takings at the gate amounted to £25, and as probably very nearly that amount was realised by the sale of tickets, the War Fund should benefit considerably from the exhibition, which can certainly be described as a great success. Messrs. Clark and Morgan, motor engineers, at Clarence Parade, Cheltenham, had several cars on exhibition, and the large building, admirably adapted for the purpose, was the scene of much animation, many of the leading gentry of the district being present.

Birmingham.

With Mr. H. Berger Graham as local hon. secretary and a loyal committee, mainly composed of automobilists, the exhibition at Bingley Hall has introduced hundreds of Midlanders to the many varieties of automobiles. Not that such education was so urgently needed as at some other centres, for of the eighty-four vehicles entered in the Trial, thirty-five were manufactured in the Midlands, twenty-four of them at Coventry, the remainder hailing from Birmingham and Wolverhampton. Still, in the French and Belgian cars there was much to interest the crowds that attended, who showed their appreciation of recent advance.

NOTES ON ORGANISATION.**The Official Programme.**

THE programme provided for the entrants is a manual requiring much study and should train the mind in persevering endeavour, being a volume of more than two hundred quarto pages.

On Mr. C. Johnson, the secretary of the Club, its compilation has added a weight of responsibility, and it must be gratifying to the committee and all concerned to see how singularly free from errors is the published work. The organising genius of Mr. C. Johnson is well known, but on the present occasion he has eclipsed his former records. Every detail has been considered, and there should be no hitch on the journey; the only way in which the arrangements can be upset will be owing to the zeal of members in arriving much earlier than the appointed time arranged at the various stopping places.

Convenience of Controls.

ON opening the programme of the Trial the official list of controls appeared very formidable, but in active operation they have proved simplicity itself, causing practically no inconvenience. In fact, they have been distinct advantages, enabling the entrants to foregather every few miles and pass the time of day with each other, or indulge in good-humoured chaff at each other's personal appearance, or retail—with full play of the imagination very often—incidents on the way. Some of the drivers waited with some impatience the fall of the flags, wielded so well by those responsible for the controls, but all seemed willing to recognise the necessity of discipline. At Bath the impetuosity of one young gentleman driving a car was curbed for the rest of the tour by a useful lesson in "making haste slowly." He thought he would dispense with the fifteen minutes' allowance for tea, but on proceeding forward his control card convicted him, and he had to wait twenty-five minutes before receiving official permission to re-start—to say nothing of the mortification of seeing half a dozen other cars go on ahead.

Certificates.

THE value of the exhibitions to the manufacturing firms entered in the Trial depends largely on being able to show a good record to the people who visit the places of display early in the day—hence the necessity for the prompt and early issue of certificates to be affixed to the cars. Those responsible

have very exacting duties, and it is hoped that all competitors will help the officials in every possible way so that the certificates can be placed on the cars early on the morning of each day exhibition.

A Competitors' Committee.

ON Tuesday evening an emergency meeting was called by Mr. C. Johnson, at the Drill Hall, Bristol, to consider the question of the co-operation of competitors with the members of the Club Committee taking part in the tour, and to advise the officials as to the exercise of the duties entrusted to them under the Club rules. Mr. E. Edmunds was voted to the chair, and it was decided that the committee should consist of three representatives of the amateurs and five representatives of the makers. The election resulted in the appointment of Messrs. Browne, Holder, and Gregson on behalf of the former section, and Messrs. A. Burgess, Critchley, Friswell, Mann, and Van Toll on behalf of the latter class.

Local Committees.

A WORD of praise must be given to the local committees for the excellence of their arrangements in connection with the exhibition, controls, etc. On one or two occasions competitors and controllers have not always turned up at the identical moment, and while in some places the latter have waited for the former, at others the competitors have exceeded the controllers in punctuality. Still, everything seems to be working very smoothly, and when votes of thanks come to be accorded on the return to town, the local committees will well deserve any that are given to them.

POLICE PRECAUTIONS.

VERY solicitous with regard to the progress of the vehicles were the police authorities, whose interest in automobilism has been demonstrated in many ways. On the first occasion Toby, M.P., of *Punch*, mounted a motor-car he was delighted at the experience—the trees leaped by, the bushes were continuous along the hedges, and the air seemed fresh and free. His only regret was inability to hold converse with a figure he assumed to be that of a policeman—but who had disappeared ere he could dismount.

Not so on the present trip. With the deliberate speed at which the cars have progressed there has been every chance of clear discernment of the figures by the roadside; and among those figures policemen have been numerous. In fact, many of the law-abiding automobilists have never seen so many policemen in the course of a single day before. They have been ubiquitous, and although some have resorted to the Boer tactics of seeking cover of hedges from which to take observations, many, unlike the Boers, have come out into the open. One practical man, having regard to the exactitude of the law and his own personal comfort, had provided a chair and table with books and stationery, upon which were recorded the times of the cars as told by his Waterbury. It was an interesting sight, and although some feel honoured at this official recognition of automobilism, others deplored the kindly-intentioned care of the Automobile Club that had numbered the vehicles fore and aft. There was no dodging the eye of the law. One driver sought to escape the numbering process by rushing into the cloud of dust ostentatiously created by the preceding vehicle, but to no purpose. He went on; but the plate at the rear of the car gave his number, and with the help of the official catalogue identity will be disclosed, thanks to the amplitude with which every detail—even such little matters as names and addresses—has been attended to by Mr. Johnson and his staff.

There were other policemen less official in their equipment, but still taking times and numbers, and two or three laid on sloping banks with watches hanging from lower branches of shady trees, and notebooks in hand.

We do not know whether the police took snapshots, although such a procedure would have been extremely useful as evidence

of the progress of the industry, and the results would have enlivened and embellished the pages of the reports of the chief constables of the counties through which we passed. That some such photographic record was intended was in the mind of several drivers, and slower speeds than usual were indulged in certain cases so as to facilitate the labours of the police. Certainly we feel confident that the police will testify to the general desire of the automobilists to ease their labours in every way, and probably on another occasion they may be willing to help the club still further by taking charge of the controls. This trial should do much to give police and automobilists a new interest in each other. That this interest will be widespread may be imagined from the fact that between Colnbrooke and Calne no fewer than forty-five police officers were seen "observing."

THE GEORGES RICHARD FOUR-SEATED WAGONETTE.

THE accompanying illustrations show the latest type of Georges Richard petroleum-spirit car, in which the motor is located in the front portion of the frame instead of at the rear, as in the earlier vehicles. The frame is constructed of channel steel. The motor, which is located under a bonnet at *A* (see plan, Fig. 2), is of the horizontal two-cylinder type, fitted with water-jackets and electric ignition; it is capable of working up to 7 h.p. The cranks are set at an angle of 180 degrees to each other. The admission of carburetted air is effected by vertical valves with automatic movement, and the escape of the burnt gases by valves placed horizontally and actuated by cams mounted on the shaft, which also carries a centrifugal governor or speed regulator. This regulator acts on the escapement gear in such a manner that it automatically shuts first the right cylinder, when the speed increases (which is the case as soon as less energy is required from the motor), then the left cylinder

FIG. 1.—GENERAL VIEW OF GEORGES RICHARD FOUR-SEATED WAGONETTE.

either wholly or partially. The governing speed of the motor can be changed at will by an accelerator placed near the steering gear. According to the position of the handle of this accelerator the motor acquires a speed of 400, 500, 600 and 1,200 revolutions per minute; the normal speed is about 700 revolutions.

On lifting up the bonnet the complete ignition apparatus can be seen—the admission valves, the exhaust valves, and the governor. The motor is cooled by water circulating around the cylinder through a series of pipes fitted with radiating gills. This pipe is 36 feet long. The circulation is ensured by a special

pump worked by a gearing off the secondary shaft of one of the motors.

Coming now to the transmission mechanism, four speeds—7, 14, 21, and 28 miles per hour—and reverse motion are provided. A single belt connects the motor with a first countershaft, a jockey pulley *G* being employed to maintain the tension of the belt. The pulley *p* on the pinion countershaft actuates a moving train of gear wheels used for changing the speeds, this train being manipulated by a handle placed on a dial situated horizontally in

FIG. 2.—PLAN OF GEORGES RICHARD CAR.

front of the driver in the usual way. The pinions can be brought into mesh with corresponding spur wheels on a differential shaft, from which the usual sprocket-wheels and chains convey the power to the rear road wheels. The variable-speed gearing is enclosed in an air and oil tight case filled with oil.

The brakes are two in number, one acting on the differential gear by a foot-pedal, while the other acts on the two wheels by two powerful hands regulated by a hand-lever. Both the pedal and hand-lever throw out of gear the engine simultaneously with the application of the brake.

Steering is controlled by a hand-wheel, while provision is made for the taking up of any wear of the driving chains. The car complete weighs about 16 cwt. The road wheels are of wood, of strong construction, and are shod with pneumatic or solid rubber tires, as desired. Our illustration shows a four-seated wagonette, but any type of body may be fitted on to the standard frame. We may add that two Georges Richard cars of the type above described are competing in the 1,000-mile Trial. The agents in this country are the Automobile Manufacturing Company, Ltd., of North Street, Manchester Square, London, W.

THE Hozier Engineering Company, Limited, has been registered with a capital of £15,000. Object, to acquire and carry on the existing business of manufacturers of motor-cars and

carriages, etc. The registered office is at 47, Hozier Street, Bridgeton, Glasgow.

AN automobile club, the first of its kind in America, has been formed at Columbia University. The purpose of the club is to hold runs throughout the surrounding country and perhaps speed trials later.

A RESOLUTION providing for the purchase of two automobiles for the use of the chief of the fire department and his first assistant has been introduced in the city council of Milwaukee, Wis.

THE HOLT VIAMETER.

THE Daimler Motor Company, Limited, of London and Coventry, have just brought out Holt's patent "Viameter," a device for indicating the gradient of the road traversed and the total distance covered by a motor-car on one dial.

An illustration of the device is given herewith. It is fitted on the dashboard in front of the driver, and is driven by a flexible shaft off one of the shafts of the transmission. The distance is recorded by three small dials similar to those in a gas meter, there being separate dials for units, tens, and hundreds. The pointer showing the gradient is luminous, so that the gradient may be readily seen at night. Another type of "Viameter" is made in which, in addition

to the gradient and the distance, the speed of the car is recorded; while there is still another form by means of which a complete analysis of a motor journey can be recorded in the form of a chart showing the distance traversed, the gradients, and the time taken over any portion. The device measures only 4 in. by 3 in. by 4 in.

ACCORDING to the *Birmingham Telegram* the project for running a motor-car service from the city of Birmingham to the more distant rural resorts has for a time fallen through, the proposed British Motor Touring Co. having come to an untimely end, the promotion having failed to obtain the necessary support to enable the ambitious programme being carried out.

WE learn that a new company is in course of formation, to be known as the Sports Motor-Car Company, with Mr. M. Capellen as managing director. The new concern, which has, among others, secured the agency for the Linon voiturette, a car of Belgian construction recently illustrated in these columns, is arranging for the opening of a large dépôt in the West End of London at an early date.

THE Automobile Manufacturing Company, Limited (late the Southern Motor Car Company), of North Street, Manchester Square, London, W., have sent in an advance copy of the new wholesale catalogue they have just issued. It gives particulars, prices, and illustrations of De Dion tricycles and quadricycles, "Papillon" ditto, trailers, and motor-car and cycle accessories of all kinds.

AT an extra meeting of the Institution of Civil Engineers, held on Monday night at its house in Great George Street, Westminster, the eighth "James Forrest" lecture was delivered by Sir William Preece, the subject being the "Relations between Electricity and Engineering." In the course of his paper the lecturer discussed the applications of electricity under a number of heads. Among these were the transmission of power, including the employment of electric motors to drive the machines in manufactories; traction, including electric railways and automobile cars, the lecturer expressing the opinion that the motor-car of the future will be an electrical one.

THE Horse, Carriage, and General Insurance Company, Limited, 17, Queen Victoria Street, London, E.C., is offering to owners of motor-cars (which are used solely for private pleasure purposes), for a moderate premium, the protection of their special three-fold policy of insurance under which the car is insured against the many risks of accidental injury it may sustain. The owner is indemnified against claims for damage done, or which may be alleged to be done, by insured car, to the person or property of third parties, and also the owner is insured against personal accidents he may sustain whilst riding in or mounting or dismounting from his motor-car.

EXHIBITION ECHOES.

Some South Wales Visitors.

REPRESENTATIVES from all corners of the kingdom were at the Motor Car Show last week. From South Wales came Mr. J. C. Morris, Mr. P. Thomas, and Mr. Walters, on behalf of the Swansea Motor Omnibus Company, accompanied by Mr. W. M. Morris, of Pontypridd, the South Wales agent for the Daimler Motor Company. They were particularly interested in the running of the new Public Service Vehicle, and Mr. Morris and Mr. Walters travelled down on this car to Bristol on Monday in the first stage of the 1,000-mile run. Representatives of the Merthyr Motor Car Company also came up during the week and were taken for a trial run on the ten-seated omnibus built for that company by the Motor Manufacturing Company, and seen on this concern's stand during the early part of the week.

A Great Future.

THE *London Argus* in commenting on the show remarks that the "Exhibition at the Agricultural Hall serves to emphasise the fact that the motor-car has a great future before it. So far the manufacturers on the Continent have been more alert than our own to its possibilities, and, as a result, have secured the immense bulk of the trade which has, up to the present, been done in every kind of vehicle, whether for pleasure or for business. It is, therefore, high time that the attention of British manufacturers should be turned in that direction, and some of the exhibits at Islington are proofs in themselves that in the making of compact, elegant, and smooth-going cars we are quickly regaining the ground lost in the early stage of the motor manufacturing industry."

A Much-Noticed Vehicle.

AMONG the vehicles which have been particularly referred to by the Press was that built by the Motor Manufacturing Company for the proprietor of this journal. Occupying a position on the stand of that concern it readily attracted attention as evidence of the style and finish with which British manufacturers are now turning out vehicles for pleasure purposes. The car is deserving of this special mention in order to emphasise the improvements in design which have lately been going on in this country. Whatever may be thought of the running powers of the cars of different nations, it is very clear that Great Britain is not behind French firms so far as appearance is concerned.

The Cycling Press and Motor-Cars.

ONE of the features of the exhibition is the large amount of attention that has been devoted to it by the cycle press. Most of the cycling papers have reported on the show, but to some of them the names of the foreign-built cars have proved such a stumbling block as to render their reports worse than useless. For instance, one paper refers to the following cars: "Hurter," "Didyer," "Gobonel-Bulle," "Benby," "Delabarge," "Peaugnot," "Renaix," "Marat Gardom," all of which, by these names, are unknown to us. Most of our readers will however, be able to distinguish the cars that are really referred to. But we think it will be agreed that a closer study of the motor-car press by the cycle journalist in question would be an advantage to him no less than to his readers. By the way, has the Delabarge car any connection with canal navigation?

The Arena on Saturday.

THE arena on Saturday presented quite a different aspect to that which had ruled on the preceding days. Early visitors found that over night the positions to be taken up by the cars entered for the 1,000-mile Trial had been clearly marked on the ground. The competitive vehicles began to arrive at an early hour, and at 5 p.m. we counted no less than forty-seven

cars and about six motor-cycles in the arena. Elsewhere in the present issue we publish a photo showing the vehicles on their marks ready for the inspection of the judges and the operation of sealing, which latter, by the way, did not meet with the approval of many of the owners of the cars, who objected to having little pieces chipped out of the frames and bodies of their vehicles. The public were given free access to the arena all day, and it is needless to add that the cars were subjected to keen inspection and criticism. Taking the vehicles shown on the various stands, together with those entered for the 1,000-mile Trial, in the arena, it can safely be said that never before have so many automobiles been seen under one roof—at least in this country. Allowing an average of £400 per car—and many would cost very much more than this, as, for instance, the Hon. C. S. Rolls' 12 h.-p. Panhard, and the Hon. J. Scott Montagu's 12 h.-p. Daimler—the value of the vehicles in the arena alone was close upon £20,000.

had been arriving all day, and towards 10 p.m. both the owners of these and many of the exhibitors began to think of turning their cars in a homeward direction. As the Barford Street entrance is the only way out of the Agricultural Hall for vehicles, the crush and excitement at this point had to be seen to be realised.

Well Satisfied.

SEVERAL instances of exhibitors selling all their exhibits were mentioned to us during the week, and during the course of a chat with Mr. J. J. Mann (Marshall and Company), we learned that he was one of the many who were well satisfied with the business done. Early in the week inquiries began and continued during Monday and Tuesday, his views of the class of

A GROUP OF MOTOR-CARS AND CYCLES AT THE EXHIBITION. TAKEN IN DEMONSTRATION ARENA.

[Curzon, Robey & Co., London, W.

The Yard.

We referred last week to the scene of "bustle" which the yard at the Barford Street entrance to the Agricultural Hall presented in the early part of the week. As the time for the close of the exhibition drew nearer the activity increased in extent, and the lively scene at this part of the exhibition on Friday night last will long be remembered by those who witnessed it. The demonstrating arena being required on Saturday for the 1,000-mile Trial cars, exhibitors all seemed anxious to make use of the last opportunity on Friday evening of displaying the capabilities of their cars, with the result that at one time fully a dozen vehicles were waiting in the yard for their turn to run into the arena. Finally, a couple of policemen had to be called in to help to regulate matters, and this resulted in several amusing incidents. Policemen as yet know little or nothing of variable speed gears and reverse motions, and could not see the point of the argument when, in answer to an order from one of them to go back, one driver retorted he had "no reverse"! The policeman did not care a brass button about such trivial matters, but insisted on the car being taken back, and consequently the driver had to dismount and push his car to the rear. Lively as was the scene in the yard on Friday night, it was even more exciting on Saturday evening. Cars connected with the 1,000-mile Trial

people attending coinciding with those of the exhibitor whose Diary we gave in our last issue. On Wednesday he had four customers who brought their cheques with them, and several likely clients could not be entertained to rides—so busy was Mr. Mann on that day. On Friday and Saturday the minds of visitors seemed mostly concerned with the 1,000-mile Trial, they having apparently determined to postpone purchases till its conclusion. But he was thoroughly well satisfied with the business he had done, and rather inclined to believe that Easter had proved an advantage in giving a chance to many provincial people to come to the exhibition instead of wasting their ordinary business time.

On the Road.

MR. MANN was probably the sole exhibitor—certainly one only of a few—who never took their cars round the arena. He believed, and certainly his experience justified him, that the better plan was to take likely clients for a ride on the road, the knowledge thus gained being much more convincing than a brief trip in the arena. Fortunately, the weather favoured Mr. Mann in carrying through his plan, and he was able not only to demonstrate the capabilities of the Marshall car on level roads, but the proximity of Pentonville Hill gave ample scope for testing the hill-climbing qualities of the vehicle.

CORRESPONDENCE.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I trust you will find room to insert this rather lengthy letter, but I have just read Mr. Canning's letter in your issue of the 20th inst., and feel impelled to give the results of my six months' experience of the Werner machine. I bought one last September, and have used it constantly in England, over English roads, not over French ones, which are acknowledged to be superior by all who have used them. As you will see, my experience with the machine has been in winter, mostly under the worst conditions. My third ride was of one 34 miles, from Peppard to Maidenhead and back, and I did the return journey under conditions I shall not readily forget, for it commenced to pour at Maidenhead, and I was drenched to the skin. The roads were deep in mud, but the machine carried me the seventeen miles without the least side-slip, and with but one halt, at Henley, to pick up a lady friend, who had preferred to come back by train. I have been over roads two inches deep in mud this last winter in Devonshire, mud like butter, which is excessively dangerous for any bicycle. In the whole course of my riding, I have had but two side-slips, once on turning a corner at right angles, almost; the second occasion, I was forced by a carriage to ride on the extreme edge of the road, on a sharp slope, to allow the carriage to pass. On both of these days, it was, I admit, absolutely tempting one's fate to go out on a bicycle, and I would frankly advise anyone *not* to go out on such roads. Mr. Canning is no doubt right in saying it is not a machine to play tricks on, but I may say that I can take my hands off the handlebar when in motion, but I have only done it to show friends who inquired "what would happen." I cannot play tricks on any bicycle, much less on this one. I forgot to say that I had non-slipping bands put on my tires, Vital's, and excellent ones they are too, but as they are smooth, I preferred the bands added, thus decreasing the chance of side-slips and punctures.

As regards stability, I cannot agree that the situation of the motor, which, after all, weighs but 20lbs., is so injurious as Mr. Canning considers it to be. If the forces passing through the centre of gravity are considered, it will be seen that the resultant R depends on the two components, W , the weight which is constant, and F , the so-called centrifugal force which depends upon the speed. The greater R becomes, in turning a corner, the greater the tendency to slip. As a matter of fact, the higher the centre of gravity when turning, the speed being constant, the smaller is the angle of inclination of the bicycle wheel to the plane of the road, *ergo*, the tendency to slip.

And now, in conclusion, I may say that my bicycle has never failed me for more than four or five minutes, and then only when I first had the machine, when I had no one to give me the little hints I have since found out for myself. I omit one occasion, where I had to pedal two miles home because I smashed my sparking plug by a blow, and had foolishly left my spare one behind. Any person of ordinary intelligence can use the machine and keep it in thorough going order. In support of my statement I invoke the fact that thousands of Frenchmen daily use

De Dion's tricycle, which is more complicated, after all, and are we to admit that we are unable to find as many intelligent Englishmen? Let "Engineer," especially if he is one, buy his machine in confidence that it will bear him safely over the roads, if he will but use ordinary prudence and also get a few hints from any user of a motor, and he will be delighted with the ease with which it will carry him about; and once let him master all the details, all the whys and wherefores of this most ingenious little engine which delights me so, and he will have no serious breakdowns.

If my experience and opinions are in opposition to Mr. Canning's I believe I may claim a longer use of the machine than he can, for I understand he had only possessed his a week or so before he had the great misfortune to break his leg. I should be pleased to give "Engineer" any information I can when I return to London in two weeks or so.

Yours faithfully,

21, Rue Beaujon, Paris, April 24th.

A. L. BENETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have now possessed a Werner motor-bicycle over a month, and am happy to apprise you that I have not found it

skid or side-slip in so pronounced a degree as the writer upon motor-bicycles in your issue of the 20th inst. appears to have done. I am afraid we have not in this country any of the other motor-bicycles to which your correspondent refers, but as they seem to enjoy great merit they may surely be expected to arrive before long.

To perfect the motor-bicycle a free engine should be provided, *i.e.*, an engine which will remain stationary whilst the machine is being pedal driven, or is being coasted down an incline, so cooling the cylinder and greatly reducing friction. A diminution in weight of the motor-bicycle would also be a great acquisition, and not very difficult to accomplish.

Altrincham,

April 23rd.

Yours truly,

J. A.

ACCIDENT TO THE DÉCHAMPS CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I regret to inform you that in driving the four-cylindered Déchamps car (which was entered for the 1,000-mile Trial) from Brussels to Antwerp on the way to London, M. Déchamps met with a serious accident to himself, and at the same time caused damage to the car, which precluded its competing in the Trial. As the test for the previous six weeks had proved everything that was desired, this mishap at the eleventh hour was very unfortunate.

Yours faithfully,

J. BURNS.

44, Berners Street, Oxford Street, London, W.

April 24th.

THE works of the Madelvic Motor-carriage Company, Ltd., at Granton, including machinery, plant, stock of raw material, etc., are to be sold by public roup in Dowell's Rooms, Edinburgh, on the 9th prox.

MESSRS. SHIPPEY'S "OXFORD" ELECTRIC SPORTING DOG-CART.

(For description, see last issue.)

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The Club Pavillon.

LET me give a word of timely warning to those English visitors to the Paris Exhibition who may be members of either the Automobile Club of Great Britain or the Automobile Club of France. And it is simply this. Do not, I pray you, search for the pavilion of the "A.C.F." in the Champ de Mars section, for it existeth not. Yes, certainly it is marked upon the map of the Exhibition, a jolly little dab of red paint nestling up against one leg of the Tour Eiffel, and supported by the Chalet Suisse and Restaurant Français No. 17, but, nevertheless, as an actuality it does not exist. After a fruitless search I came to the conclusion that the automobile edifice had been pushed off the edge of the little lake upon which it is supposed to stand into the water, and that in all the wild turmoil and excitement of exhibition preparations it had been forgotten and left to die a watery death amid the miniature whirlpools of the cascade of the Palais Lumineux. But my theory was incorrect, for I have since learned that the pavilion will exist at the

THE SIRENE VOITURETTE. (For description see last issue.)

Vincennes section only, and that the Champ de Mars will not be favoured with a club rendezvous.

Paris-Lille Race.

THE first race to suffer from the unfortunate accident at La Croix de Noailles is the Paris-Lille course, which, announced for Sunday next, has now been cancelled by reason of M. Poirson's refusal to permit of its being run over the roads within his department. The decision of M. Poirson, who is the Prefect of the Seine-et-Oise, does not necessarily imply his intention to prohibit all races through his department, and as a temporary measure it will have a beneficial effect upon the general public and automobilists alike. In order not to disappoint the good people of Lille, who look forward with the greatest interest to their annual motor-cycle race, the organisers of the event have decided to hold a 100-kilometre invitation race on the Lille track, and have selected as competitors six veritable champions. Béconnais, Baras, Osmont, Rigal, Fossier, and Bathiat are certain to provide good sport, and, given favourable conditions, some very fast times are sure to be achieved.

In Belgium.

FROM Brussels it is announced that the general meeting of members of the Automobile Club was held on Thursday, the 19th instant, but that it brought together but a very poor attendance. After the usual secretarial reports had been read, the treasurer presented his balance-sheet for the financial year, which showed a balance of some £30 in the club's favour. The election of the committee was then proceeded with, and the

following members were duly nominated:—MM. Grégoire, Van der Straten, de Sanoye, Dombreley, Dewandre, Von Limburg, Fraipont, Van Hoobronck, and Ruys. Certain modifications in the club rules and regulations were unanimously agreed to, and the meeting then terminated. Outside of France there is probably no country in which greater interest is taken in automobilism than in Belgium, and with active leaders the club has a great future before it.

A Cup for Béconnais.

UPON the initiative of Mr. Léopold Canning, *Le Vélo* has opened a subscription list for the purpose of presenting Béconnais with a cup in recognition of his wonderful performances in the recent motor-cycle races in the South of France, and this project is to be warmly commended. As will be remembered, Béconnais achieved a startling performance on the outward journey of the Nice-Marseilles-Nice race, only to lose on the following day—when undoubtedly no racing whatever should have been indulged in—all benefit of that wonderful run. At La Turbie, too, misfortune dogged his footsteps, but in La Course du Mille, La Course de l'Estérel, and La Coupe des Motocycles du Sud-Est he made extraordinary times, and clearly demonstrated his right to the title of "le roi des motocyclistes." I understand, too, that although informed previous to starting for the latter event that he could not gain any money award, Béconnais nevertheless set out on his record ride, an example that some so-called amateurs might follow with advantage. As everyone will assuredly send to the *Vélo* some token, no matter how small, of his appreciation of Béconnais's pluck and skill, the list of subscribers will grow apace.

The War against "Chauffeurs."

THE unfortunate accident last Sunday week at La Croix de Noailles, on the occasion of the Paris-Roubaix, is likely to have far-reaching consequences, for the authorities, the general public, the police and the Press, all have taken up arms against everybody and everything connected with automobilism with a suddenness and intensity truly characteristic of the French nation. If *chauffeurs* are wise they will quietly let the storm blow over and not increase its violence by useless squabbling and discussions. Reforms are needed, but the wholesale suppression of all the privileges now possessed by automobilism simply exists in the heated imagination of certain journalists. The special commission has been hastily convened, cyclist policemen hunt in couples for *chauffeurs* exceeding the legal limit of speed, racing will be entirely suppressed, the forest of St. Germain will be closed on Sundays to the passage of automobiles, the cars will be numbered, the provincial towns will be protected by the placing of *caniveaux* on the routes just before their gates, the examinations of drivers will be rigidly enforced and so on *ad infinitum*. Good, but how many of these precautions will be continued and how many of the threats carried into effect? Let the special commissioner get quickly to work and we can depend upon just measures being proposed, and I hope adopted by the Government, but when each prefect and each commissioner of police draws up his own code of regulations just as his judgment dictates we shall never arrive at a satisfactory solution of our troubles.

The Turin Meet.

THE three days of automobile fêtes at Turin, which commenced last Saturday, the 21st inst., had been eagerly anticipated not only by Italian *chauffeurs*, but by many of the Riviera enthusiasts, who had learned at Nice of the very excellent programme prepared by the "A.C.I." As a result, the meet was largely attended and the visitors went away more than satisfied with the sport provided. A happy combination of excellent roads, glorious weather, and perfect management rendered the gathering a truly memorable one. The opening day was devoted to a series of races up the well-known hill of Madonna del Pilone, at Pino Torinese, which is some 4½ miles in length. The motor-

cyclists were the first to make the journey, and once again Marcellin's two-cylinder motor demonstrated its ability to convey its rider up hill at a speed at which some racing cycles do not even attain on the level. Gasté, too, would have done an excellent performance, but was stopped *en route* by a vehicle barring the road. The official returns were:—(1) Motor-cycles of one seat: 1, Marcellin, in 6min. 46sec. (average 60 kilomètres per hour); 2, Biscaretti, in 8min. 36sec.; 3, Cerano, in 9min. 13sec.; 4, Monti, in 9min. 14sec.; 5, Magli, in 9min. 43sec. (2) Motor-cycles of two seats: 1, Marcellin. (3) Voiturettes of two seats, weighing less than 400 kilos.: 1, Clerissy, in 15min. 42secs.; 2, Agnelli, in 19min. 10secs. (4) Cars of two seats, weighing more than 400 kilos.: 1, Stead, in 9min. 28secs.; 2, Cuchelet, in 10min. 42secs. (5) Cars of four seats: 1, Chauchard, in 15min. 20sec.; 2, Gondo, in 23min. 26sec. The second day witnessed the *course* Turin-Pignerol-Saluzzo-Turin, a race of some 130 kilomètres (81½ miles), which was decided over a really capital route. The times made by the motor-cyclists were excellent, the most notable performances being those achieved by Gasté and Marcellin. The former covered the 130 kilomètres in 117 minutes, which represents an average speed of 66 kil. 600 m. (about 42 miles) per hour, while the latter, mounted on a quadricycle and carrying a passenger, made the same journey in 137 minutes, equivalent to an average speed of 57 kilomètres (36 miles) per hour. The times recorded were as follows:—(1) Motor-cycles of one seat: 1, Gasté, in 1h. 57min. 15sec.; 2, Guggiari, in 2h. 24min. 24sec.; 3, Biscaretti, in 2h. 27min. 21sec. (2) Motor-cycles of two seats: 1, Marcellin, in 2h. 17min. 53sec. (3) Voiturettes of two seats, weighing less than 400 kilos.: 1, Storero, in 2h. 55min. 25sec.; 2, Clérissy, in 3h. 6min. 45sec.; 3, Agnelli, in 3h. 34min. 10sec. (4) Cars of two seats, weighing more than 400 kilos.: 1, Cuchelet, in 2h. 12min. 17sec.; 2, Dellaferrera, in 2h. 50min. 6sec. (5) Cars of four seats: 1, Chauchard, in 2h. 41min. 20sec.; 2, Gondoin, in 3h. 21min. 30sec. In a series of motor-cycle events subsequently decided upon the track Marcellin beat Gasté over a distance of 2,160 mètres (six laps), his time being 2min. 7sec., and Biscaretti scored a victory over Monti. In addition to a great crowd of automobile enthusiasts all the leading authorities of Turin and the surrounding country were present at different times during the meet.

The Italian War Department and Automobiles.

they will inspect every type of motor-cars at the Exhibition in view of the adoption of one for the Italian Army.

THE Italian Minister of War, General Pouza di San Martino, has appointed a commission of officers to study the question of the motor-car and its possible application to modern warfare. The commission will start for Paris shortly, where

A Trip from Vienna to Paris.

HERR LOEWY, an Austrian journalist, has made the journey from Vienna to Paris in a motor-car, having thus traversed a non-direct route of 1,500 kilomètres by the most modern means of locomotion. He started from Vienna on the 5th inst., accompanied by a *mécanicien*. His vehicle was of 9 h.p. The weather was bad, and there were many breakdowns, especially on the rough Austrian roads. Herr Loewy has not attempted to establish a record for speed, and only claims to have made a long, practical journey in a motor under due control. He had to take a long route in order to avoid bad roads, for the real distance between Vienna and Paris is only 1,200 kilomètres.

WE learn that the new two-seated voiturette exhibited at the Agricultural Hall last week by the Progress Cycle Company, Limited, Foleshill, was driven back to Coventry by road on Tuesday. Although the car had been hastily finished, and practically untried before being brought to London, it did the journey without trouble of any description, and took every hill on top speed.

WAR AND POWER-TRACTION.*

By THE RIGHT HON. J. H. A. MACDONALD, C.B., LL.D., F.R.SS. (L. AND E.) (COMMANDING THE FORTH BRIGADE).

AT a time when war as a factor in national life has been brought home to this nation in a very sudden manner, all who are interested in power-traction will, I think, agree that the question of its applicability to the purposes of war should be studied. There are two aspects in which it presents itself—the combatant and the non-combatant. The first relates to the uses which can be made of power-traction to move weapons of war to and within the area of the actual fight, and to carry armed men into or out of that area, and, it may be, to give them practical aid and protection while fighting. The second, and in some aspects the more important, relates to those less stirring, but absolutely essential operations which take place outside and even sometimes inside the fighting zone, by which the necessary supplies of ammunition, food for man and beast, camp equipment, ovens, and many necessary stores that need not be particularised, as also engineering implements and explosives, pontoons, horse-shoeing forges, duplicate parts, repairing tools, ambulances and many other indispensable appliances and munitions can be carried along with the army, so that it may be kept efficient, and maintained in strength and health and equipment for the exertions it must undertake. As regards the feeding question, there is no truer saying than that which is often quoted—that “an army marches upon its belly,” and if this were kept in view, we should not often hear the cry, “Why doesn't General ——— get on? What's the good of his sitting doing nothing; he seems to be wasting time terribly.”

It is plain that if means can be found by which the length of the transport train conveying a certain quantity of material may be reduced, the difficulties of transport and supply would be diminished in a corresponding degree. And further, if speed could be increased, still more advantage would be gained. At present, if a large force starts by one road, say, at 4 a.m., the last wagon may not move off for two or three or even four hours after that time, and will arrive at the end of the day's march correspondingly late. Therefore every reduction in the length of the column and increase in the speed of movement would be a great gain. Again, if the haulage be done by animals, delays for feeding are a necessity, and difficulties of watering may be serious and even in some cases make the use of a particular road impossible, or affect injuriously the laying off of marches, as halts cannot be made where water is not within reach. Add to all this, that in the case of animal traction, if the weather is very wet or very dry, the road will, under the shoe-pressure of such a multitude of traction animals, dependent upon foothold for their efficiency, have its surface completely destroyed, and thus made to cause greater wear and tear to animals and vehicles following, and possibly, if the road becomes badly rutted, to cause a serious breakdown of rolling stock, and impose much wearing fatigue on troops requiring to march by the road after some of the wheel traffic has passed. In short, war brings into exaggerated relief every disadvantage which appertains to animal traction. Notwithstanding its many disadvantages, animal traction has been till very lately the only mode of haulage in use by armies in the field, whenever any freedom of movement, either strategic or tactical, was sought for. A railway, of course, will bring forward supplies very rapidly, and as long as an army can accomplish what it has to do while clinging to a railway, no transport could be more efficient. But if an army is tied to rails, and has to limit its operations by the necessity of keeping close touch with an iron road, its commander loses all freedom of manœuvring, and his opponent is able to forecast his every move and foresee how far he can carry it. The present war has illustrated this very forcibly. As long as the commanders in the west and east of the seat of war were compelled to hold on to the railways, as their means of conveying bulk supplies, the Boers could make up almost impregnable positions to bar their progress. But where, with road transport, our generals were able to move out from the railways and round the entrenched positions without losing the power to bring food and supply munitions of war to their forces, the whole scene changed as by magic, and our opponents had to abandon their carefully prepared positions in haste, and even to suffer disaster.

The use of the road being thus an essential of successful military operations, does this not open out a promising prospect for those who are engaged in developing power traction? To this there can be but one answer from all who are familiar with the progress in mechanical haulage which has been already made. Even the now old-fashioned traction engine is not a power to be despised for army transport. At the risk of the imputation of egotism, I will say here that the volunteer brigade under my command was, as I believe, the first military unit to employ power traction in this country for this purpose. Five years ago, having arranged that the brigade was to march to camp as an exercise, the distance being a full day's march according to the military standard, I authorised the supply and transport department of the brigade to make a contract for the whole equipment and stores for 1,500 men to be conveyed by two traction engines. The military authorities at headquarters shook their heads over the proposal, prophesying that we should find our tents in the ditch when they should have been pitched, and our men waiting in vain for their evening meal when it should have been ready. But it was not so; our train came in in good time. There was, indeed, an accident to machinery, by which for the last mile or two one of our engines was not efficient, but the other, with its reserve of power, took on all the wagons, and triumphantly brought

* From a paper read before the Automobile Club, at the Automobile Exhibition, Agricultural Hall, London, on Saturday, April 21st, 1900.

them in. On our return march, the whole was accomplished without a hitch. Since then the War Office has become alive to the value of this mode of haulage, and a number of traction engines have been doing excellent work in Natal. I am informed also that an efficient traction engine transport was organised in India many years ago by Lieutenant-Colonel Crompton, who is at present engaged in obtaining additional steam transport for South Africa.

But such engines, drawing trains of wagons, are not the most suitable for military transport work. It is rather in the single self-driven wagon of moderate size, dragging one other wagon behind it, and having a capacity for speed considerably more than—say double—that of the ordinary traction engine, and with its machinery so placed as to add little to the length of the vehicle, that the most practical application of power traction for war supply is to be expected, for this would reduce the space occupied by a supply train on the road very considerably. In the first place, as the exigencies of military wagon transport make teams of four horses in many cases a necessity, a power train of double wagons would not take up so much as half the length of road occupied by an animal-drawn train, even if the wagons carried no greater load than at present. This, both from a convenient supply point of view and also from a military point of view, would be a much-to-be-desired improvement. For, of course, if a train is reduced to half its length, the necessary guard will only employ half the number of fighting men, and the exposure to risk of raids on the line of communications is diminished proportionately to the shortening of the line of vehicles. But the diminution would be more than one half, for as a train of 1,000 wagons will require probably 2,500 horses at least, in many cases the team occupies more road than the wagon. And where so many horses are employed, a considerable proportion of the train must be taken up with the necessary supplies for feeding and the appliances for tending, nursing, shoeing, clothing, and picketing the animals, and repairing and renewing harness. Also, as one man can only take care of two horses, the equipment and supplies for many additional men must be conveyed as compared with a system in which one man would take charge of each traction unit. Against all this there would be nothing to set except the weight of fuel and provision for repairs on machinery. Further still, a horse-drawn military wagon can seldom be loaded up to the extent of more than two tons, even if drawn by four horses, and therefore there would be a still greater reduction in the length of train, if each power vehicle could carry, say, four tons of load. Thus, if the horses were eliminated and the number of wagons reduced, it is not saying too much to assert that a convoy might be brought down to one-third of the present length, or even less.

Road difficulties would also be diminished in a marked degree. The surface of the road would not be cut up as it is at present, making it in dry weather a sea of dust, destroying foothold and causing wheels to run heavy, and rising in clouds to parch the throats, clog the nostrils, and close the pores of man and beast, while in wet weather it becomes a quagmire, hiding ruts and hollows produced by the excessive traffic, rendering marching a distressing exercise and traction an excessive strain on animal endurance. Also the power train, one-third of the length of the animal train, could be moved at six or even eight miles an hour, a speed twice as great as is now possible. Thus, while at present it may take some hours before the last wagon of a train can move off after the first starts, and accordingly it must come in the same number of hours late at the end of the march, an efficient power system would reduce the time to one-fifth of what it is at present. The capacity of the road for movement of troops and stores would therefore be greatly increased, and the fatigues and risks of the road sensibly diminished, as well as the delay at the close of the march by bringing up camp equipment and providing refreshment for the weary troops. Indeed, in any cases where an advance guard reported that the country in front was clear of the enemy, the supply officers could make use of their superior speed, could take with them a fatigue party and the cooks belonging to their column, and make progress in providing a meal while the troops were still on the march. And no one who has not experienced it can realise the difference it makes to the soldier, if after a long day he can at once, or at least without a tantalising delay, obtain his cooked meal. A wait of two or three hours in an exhausted condition in the evening may lower his capabilities for marching or work the next day, and his entire *morale* for more than one day, and in a very considerable degree. It is safe to predict that efficient power traction would do much to prevent risk of the soldier being exposed to such trials of endurance and the consequent loss in strength and addition to cost.

Add to all this, that the mechanically driven vehicle is not like a hauling animal in one particular vital to the question—it does not require periodical stoppages of considerable duration in order to gather physical strength that has been exhausted. An animal can only do a certain amount of work in a day. The power vehicle is not limited to what is called a day's work, and compelled to rest when extra work has been done. It is as fit for work the day following a forced march of, say, forty or fifty miles as when it has been standing idle for a day. The commander has no questions of exhausted transport animals to consider, a matter which may often be most serious, hindering his freedom for advance, and greatly increasing his difficulties in retreat.

All these considerations tend to one conclusion—that successful enterprise in the construction of transport vehicles for war purposes will be of incalculable service to an army in the field.

Turning now for a short time to the combatant side of the question, it will be seen at once that the possibilities of substituting power traction

for animal haulage are much more limited than in the case of transport. As regards all cases where the road is to be left for the open country, the only traction which requires to be seriously considered is that of guns and machine guns. And it is evident that as these must often be forced over broken and even obstructed ground, power traction, as far as it has been developed up to the present time, is not practicable. Anyone who has seen the way in which even field batteries are made to fly over ditches, low fences, and boulder-strewn ground, and up heavy gradients can have no doubt on this matter. Until lately, there has been no development of traction at all within the fighting zone for any other purpose than the handling of artillery, ammunition supply carts, and water carts. But we have in the armoured train the first beginnings of the use of power traction for combatant purposes. Both in Egypt and in South Africa such trains have done useful service, although their capacity for good work is necessarily limited by their being confined to a fixed line of railroad, which is easily destroyed, and if in any degree broken up may reduce an armoured train to nonentity, and expose it to capture. National defence is the primary consideration in the development of fighting resources, and if roads can be effectively used for fighting by aid of power-traction there is no country better equipped for doing so than our own. I think it will be found that there is great scope for development in this direction. High-speed motor-vehicles, with bullet-proof sides, would be of great value in the advance-guard and rear-guard work of an army. Such vehicles, capable of a speed of 15 or 20 miles an hour, could be moved out in front for long distances, each carrying ten or a dozen men and followed by cyclists who could search the country between their own road and the next on their flank, sure of assistance from a pivot machine gun on the wagon in covering their retreat if driven in, and confident that they could run the gauntlet, and get back under its protection if they were outflanked or outnumbered, the cyclists using the armoured car as cover by riding in front or at the side of it during retirement according to the direction of the enemy's fire.

But still further, there may be good ground for believing that the introduction of power-traction may prove the solution of the difficulty which to some extent hampers the efficiency of the fighting cyclist. But if cyclists were accompanied by a fast moving armoured power-vehicle, they would have much greater freedom. Ingenuity would provide a locking bar arrangement by which the cycles could be made up in groups, so as to run upright freely when hauled by the wagon. Thus they could be taken forward or back as required. The rifleman having been brought rapidly forward by his bicycle, would be able to do his field duty without troubling himself about the safety of his machine, which would be moved about and defended by those working the small moving fort, with its Maxim gun, and both could thus do their duty for the general end in view, the rejoining of cycle and man being for the time a secondary question.

Such small mobile forts as have been spoken of would certainly be useful in many ways. They might be invaluable in protecting a flank of an advance in battle, and nothing could be better in a retirement for enabling a rear-guard to hold on for some time, and so check a pursuing enemy. Their high speed would also make it possible to move them by cross roads to any point of a line of battle where they might be of service, and, of course, wherever there was fairly even surfaced grass land they could be taken off the road and run over the open country. Like the old *testudo* of the Romans, they would, in moving, carry their own cover against the missiles of the enemy, but with the advantage of travelling at a speed in proportion to the increased range of modern armament, and being able to disperse for fighting, with their *testudo* to aid them, and on which they could fall back, they would combine some of the mobility of the hare with the hardness and shell of the tortoise. Where it was necessary to defend, or to assault a bridge or a defile, or to repel an assault, such vehicles would be invaluable to race forward and cover an attack, or to hold on as a tortoise fort in defence until reinforcements could arrive. In a day when cover from musketry fire must be sought by both attacker and defender in the field, such movable armour would often be most useful as an aid to success in fighting.

I will ask you to consider two more points. The first is whether in such an accident as happened to our guns and convoy three weeks ago, to the east of Bloemfontein, the presence of a few military armoured wagons with pivot machine guns and haulage power, might not have made all the difference in saving of guns and the protection of the convoy. In these days when a successful ambush is a veritable death-trap, and when it is not bravery but foolhardiness to ignore cover, are there not great probabilities before us in mobile cover obtained by mechanical traction. The second is, whether there is not great gain in possessing a haulage power which has no nerves and no vice, which has no tendency to stampede, and never sulks or jilts, is unaffected by tetse fly, and never takes the bit between its teeth.

Allow me now for a few minutes to sketch what might be the traction equipment of an army in the field in the next great war, which, let us pray, may find us neutral. Out in the front, on every road, armoured high speed vehicles mounted with pivot machine guns, such as I have described, to co-operate with the mounted troops and cyclists in covering the advance, feeling for the enemy, and capturing and holding bridges and fords and places of vantage, and at another time aiding in the converse duties in covering a retreat, and also in general engagements giving support at points as required, and protecting flanks; in the transport, power vehicles, with a maximum speed of, say, 8 to 10 miles an hour, every tenth or twelfth being a service vehicle, armoured, and of extra speed and horse power, carrying a pivot machine gun, the

driving engine so fitted that its power can be used for working purposes, each being supplied with, say, 20 or 30 fathoms of steel ropes. These service vehicles would also carry certain appliances: for example, one would carry a small forge or smith's tools, another wheelwright's plant; another spare parts for the driving machinery; another screw jacks, anchor pulleys and block and tackle for heavy warping work; another small arms repairing plant; another spare bullet resisting plates; another search-light appliances; another an entrenching plough, to be hauled by steel cable, and all would carry some entrenching tools. These vehicles would be the centres of defence of the convoy, and a power traction transport would have many advantages for its own defence. In the case of horse traction drivers must stay by their horses and manage them, but with power traction all drivers can concentrate with the escort at the armoured vehicles, thus making the defence stronger. These vehicles being mobile could be moved as the exigencies of the resistance to attack might make necessary, and being armoured they could offer a much more effective defence. Again, where steep hills are encountered these service wagons having extra horse power could assist the ordinary wagons. In case of necessity they could be used with their steel ropes to work the wagons up gradients, either by warping over an anchored pulley at the top of the hill, or by simply first ascending the hill and towing till the towed wagon reaches the top and then returning to tow the next. One can imagine how much time would be saved in such a case. One can also see that where, as is the case in the present war, it is necessary to move heavy guns up very steep slopes, such service power wagons could be anchored and used to haul by wire ropes over anchored pulleys, and with block and tackle where necessary, instead of using teams of eighteen or twenty oxen, and in some cases hundreds of men. These are but some of the prospective advantages of mechanical traction. Many others will present themselves as experience widens. Lastly, these service wagons having extra power and only carrying a light load, could be attached to and haul any transport wagons whose traction power might be disabled from any cause.

It only remains in this outline of the subject to consider what is the best class of motor to be employed. It would appear that there are at present only three possible sources of power which would be suitable for the class of work which is likely to be required in war—steam, heavy oil, or light oil. The other sources of power sometimes used in traction—compressed air and electricity—are evidently out of the question. Kerosene, petrol or benzoline, although they have proved themselves highly efficient for ordinary road traction, present serious difficulties when it is proposed to apply them to war transport. They are ill adapted for use in hot climates, and might be a source of considerable danger if carried in bulk in a military wagon which may be struck by heavy shells, and the volatile spirit scattered over the wagons near and set on fire. Heavy oil does not present the same difficulties, and it may be found that the progress of invention will develop this mode of traction to a high practical efficiency for wagon haulage. Steam raised by oil fuel or by a combination of solid fuel and oil fuel presents only two difficulties; the one is its dependence upon a water supply sufficient in quantity and of a quality not tending to incrustation. Such a supply may not always be available, and without it steam traction must break down. The other difficulty is that any escape of steam would betray the presence of the convoy to the enemy at very great distances. Everyone knows how easily condensed steam can be seen over many miles of country. Upon the whole, although one must express any opinion with diffidence, it seems likely that explosion engines worked with heavy oil give the greatest promise of success for war transport.

It is certainly matter for congratulation that while on the Continent and in America attention in motor-traction circles seems to be mainly concentrated on fast passenger vehicles, much progress is being made in this country in the development of heavy van and wagon power traffic. Those who are engaged in the study of this important branch of a new industry may rest assured that there is a great field open for design of vehicles suited for war purposes. The present war has led to Her Majesty's Government announcing many changes in the military organization of our forces in time of peace. And one of the most important of these is that the Volunteer force is to be supplied with transport, the purpose being that there may always be a large number of standard military vehicles ready for use on an emergency. It will lie with the manufacturers of mechanically-driven wagons to convince the War Office authorities that they can turn out efficient vehicles for transport purposes. If so, it is difficult to believe that they will not be adopted, and orders given for their supply to our home defence forces, for nothing can be more certain than that such vehicles, if found practical, will be most suitable for the purpose. In time of peace transport carriages must necessarily stand idle for considerable portions of the year, particularly if employed for volunteer corps. Intermittent horsing is always expensive, and as a preparation for active service most unsatisfactory. But the motor part of a power wagon can be always ready for use, and will cost nothing for up-keep beyond the price of proper preservative grease when it is laid up unused for a time. At any moment it can be turned out efficient, and the training for its management under proper skilled inspection is not difficult. And as the wagons can be constructed for heavy loads, and can cover at least twice the number of miles that can be covered by animal traction, in any given time, a much smaller number would be necessary, thus compensating for any extra initial cost per wagon.

May the British citizen from motives of humanity as well as of patriotism give attention to the question of war traction, and if he does so, the members of this club cannot doubt that mechanical power will prove itself efficient above all other modes of road haulage. But the designer and the builder must not wait until a Government Department

seeks them out and asks for their aid. The war authority is too busy at present, making the best use it can of the means now at its command, to take any initiative in the adoption of new appliances. But the departmental powers of other nations, and notably of Germany, having no war on their hands, are working at the problem, and we are told that the Emperor has offered a large premium for the most suitable motor-vehicle for war purposes. Our designers must not be behind the world, nor must they wait for offers of premiums. They must put trust in their own exertions and in nothing else. Let them put before the country, as we know they can, specimens of their thought, their experience, and their inventive power—vehicles which will not break down under trial, but will be as efficient for the road as the locomotive engine has so long been for the rail.

FURIOUS DRIVING CASE.

ON Thursday, last week, at the Stockport Sessions, a Mr. James Lowe, described as a music dealer, of Manchester, was summoned for furiously driving a motor-car at Handforth on April 7th. A police-constable stated that on the date mentioned he was in Wilmslow Road, Handforth, when he saw the defendant coming down the hill at a rate of seventeen miles an hour. Mr. Lowe said that he had covered 2,000 miles on his car, and the average speed was only nine miles an hour. He could not go so very fast because the car was only geared at twelve miles per hour. Constable Mellor gave evidence that, armed with a stop-watch, he timed the speed of the motor. It covered 220 yards in twenty-six seconds, which was equal to a speed of more than seventeen miles an hour. The Clerk: How do you get the distance? The Constable: Oh, we have the distance marked out and measured. A fine of 20s. and costs was imposed.

A MOTOR-CAR ACCIDENT AT LOWESTOFT.

THE *Eastern Daily Press* announces that, "on Thursday, last week an accident occurred at Lowestoft, in which a motor-car played an aggressive part, and at least eight persons suffered injuries more or less serious." Mr. W. R. Youngs, who was driving the car, furnishes us with the following account of the accident:—"I shall esteem it a favour if you will insert a few facts in reference to the motor-car accident, as the reports that have gone forth are not altogether accurate. It was an accident pure and simple. To avoid colliding with two lads on cycles, who crossed in front of me, I turned sharp to the right, only to find about a dozen or more children within a few feet of the car. Though fitted with powerful brakes I dared not apply them, as by the time the car stopped many of those children would have been crushed between the car and the wall. The only chance I had was to throw the steering lever hard over to the opposite direction, which would have cleared the children, but for a mail-cart which was standing with them. Just one inch of my hub of the rear wheel caught the mail-cart, with the unhappy result of sending the children spinning against the wall. I found on getting off the car I had knocked down a man and his little boy on to the bank, the front wheel still resting on his leg. I might say that up to this time my passengers did not know that anything had happened. I got the man on my car and drove him home. No damage, not even a scratch, was done to the car. The road is one which I have come up and down scores of times and is not in any way dangerous."

SAD DEATH OF A MOTOR-CYCLIST.

LATE on Friday last the death occurred at Coventry of Mr. John Slaughter, eldest son of Councillor Slaughter. An inquest was held on Tuesday, when the evidence of Mrs. Emma Slaughter showed that the deceased was a cycle traveller, employed by Messrs. Bayliss, Thomas and Company, Limited. He was forty years of age. About a month ago he went for a three weeks' tour on a motor-cycle, and the evening after he returned he said he had met with an accident, that he was going along the road behind a carriage and pair when the noise of the motor frightened the horses, who pranced and backed, and knocked him off his machine. He lay in the road for an unknown period, as the man drove the carriage on. He showed Mrs. Slaughter marks on his hands, and said it had given him a good shaking. He became ill, and three weeks after receiving the injury he went to bed. Dr. Brown was sent for, but deceased grew worse, complaining of great pain between the shoulders, and coughing, and died on Friday last.

Mr. Chas. Timberlake, the Tunbridge Wells agent of Bayliss, Thomas and Co., proved that on March 16th deceased came to him and asked for his cycle to be sent for from the station, as he had had an accident. He said he was coming from Guildford by Dorking to Tunbridge Wells, and when about six miles from Tonbridge he was riding behind a carriage and pair, when the horses took fright, and the coachman kept pulling the horses back right on to him. The motor was stationary when the accident happened, as the deceased was waiting to see how the horses would behave. He further said that he fell between the wheels, and that they drove away and left him unconscious. When he recovered he wheeled the machine to Tonbridge. He was a good cycle and motor rider, and a strong, healthy man.

In summing up, the Coroner expressed the sympathy of himself and the jury with the relatives of the deceased. The evidence, though of a second-hand nature, was absolutely clear, and the only point for the jury to consider was whether the ribs of the deceased had been fractured at the time of the accident, upon which matter the medical evidence was very conclusive.

The jury returned a verdict of "Accidental death," and expressed their sympathy with the deceased's relatives.

THE Motor-Car Journal.

COMMENTS.

proving a really arduous pilgrimage and is something more than a mere holiday—as can be inferred from some of the photographs published in our pages this week.

Dr. Turner's Experiences.

In the current number of *Chambers's Journal* Dr. Dawson Turner, of Edinburgh, gives some of his experiences with motor-cars. His first car was a De Dion-Bouton quadricycle, and he tells how, on one occasion when his stock of petrol was exhausted he filled the reservoir with ordinary lamp oil. He then made a bonfire with some newspapers under the reservoir, continuing the heating until the vapour of the lamp oil could be seen escaping up the float-chimney. The result was magnificent and the following six miles were covered at a great speed. On the motor slackening the experiment was repeated with success. Dr. Turner did all these things in his innocence and, needless to say, does not recommend others to do likewise. His present car is a Delahaye phaeton on which four people can be conveyed from Edinburgh to Carlisle at a cost of less than ninepence each for fuel. Dr. Turner's article will be of general interest to the public whose curiosity in automobilism will have been aroused by the great Trial now in successful progress.

Modern Motor-Vehicles.

At a meeting of the Leeds Association of Engineers on Monday, the President (Mr. Joe. A. Tempest) in the chair, Mr. Rowland Winn read a paper on "Modern Motor-vehicles." These, he said, were a great improvement on the machines of three years ago. There were complaints about the price, but this could be reduced when the demand increased. He described in detail the various kinds of motor-vehicles made in this country, in France, and in America, and pointed out the more important features of each. He preferred the smaller sizes of cars, driven by spirit motors. Electricity was an ideal power, there being no connecting rods or gear for producing different speeds required; but up to the present satisfactory accumulators had not been invented. A discussion followed, in which Messrs. J. C. Jefferson, C. Koerte, J. H. Mann, R. W. Crabtree, and others took part. A vote of thanks was accorded to Mr. Winn.

The Postal Motor-Van in Ceylon.

CEYLON has often been described as "a plucky little, tight little island," and this is not a fancied description. As an instance of the "push" of the island a paragraph from the *Times of Ceylon* shows how the authorities are endeavouring to further improve a comparatively good inland postal service, which is at present conducted by horse-coach. "The post office motor-car left Colombo on February 21st on its trip to Avisawella, returning the same day without any mishap, the journey out being performed in good time. The car, in charge of Mr. Summers and his assistant, left the Fort at 8 a.m. and reached Kaduwella at 9.45 after a smooth run, while it next stopped at Hanwella, and then went direct to Avisawella, which was reached at 12. No difficulty whatever was experienced, and the hilly portions and bends were negotiated without any mishap occurring. After a few hours at Avisawella the return journey was commenced at three o'clock, the ground being covered at an easy speed, with occasional halts by the way, Colombo being reached at eight o'clock. The experiment was made with a view to see how the car would travel on long-distance journeys, and the result was satisfactory. The distance, we understand, could have been covered in half the time, but there was no necessity for a hurried trip." The van in question was, it may be remembered, built by the Lancashire Steam Motor Company, and supplied through Messrs. J. Harvey and Co., of London.

Municipal Authorities and Motor-Vehicles.

HARDLY a week passes by without some local authority announcing its intention to adopt motor-vehicles. The matter has for some time been agitating the minds of the members of the Public Health Department of the City of London Corporation, and while not going as far as the Chelsea and several other Metropolitan vestries, they have decided to give the automobile a trial, for it is now announced that the Streets Committee are prepared to consider proposals from firms experienced in the manufacture and use of electric motor-cars for the hire of an electrically-driven dust-cart for collecting and removing the dust and trade refuse and street sweepings from the City to the Corporation's dépôt at Letts Wharf, Commercial Road, Lambeth. June 1st is the last date for the receipt of tenders.

Protection of Municipalities.

AMONG the many suggestions put forward for the efficient protection of French towns and villages against the onslaught of the ferocious *chauffeur*, not the least original is that of Paul Meyan. The proposal of this gentleman is simply to place across each road, and in close proximity to the town, one of those deeper species of *caniveaux*, or water courses, which occur at regular intervals on many of the French routes. There is but little doubt that the adaptation of this scheme would effectively reduce the speed of cars when entering a town, and if, in addition, the main thoroughfares were constructed of good bumpy *pavé* the motorist's passage would in the future be as humble and subdued as it is to-day overwhelmingly aggressive. As would naturally be expected, M. Meyan's suggestion has

given rise to a storm of protests from certain sections of the automobile world, mingled with much amusing chaff. "As a fair example of the latter," writes our Paris correspondent, "I may instance the humorous circular which recently appeared in the columns of *Le Journal des Sports*. This circular, headed 'The Improved Water Courses and Caltrops Company, Limited., for the rapid destruction of automobiles (patents Meyan),' goes on to announce 'that in order to meet the wishes of a great number of municipalities we have founded, under the patronage of M. Meyan, a society for the construction of exceedingly treacherous *caniveaux*, designed to destroy with the least possible delay the most perfect automobiles.' Then follows a brief specification of each of the three types actually being delivered. The first designed to provide slight shocks to voituresses and cycles, the second guaranteed to smash the springs, etc., of the same classes of automobiles, while the third type, specially constructed to give a multiplicity of shocks, and provided with a layer of broken bottles and bayonet points, assures, without possible contestation, terrific croppers, and the infliction of serious injuries. In conclusion it is announced that "the engineer in chief, M. Meyan, is studying a new type of *caniveau* with bath, douche, and irrigation complete of the *chauffeur* and motor, which will assuredly command a great success. There should be a great future for this new society, and the shares will certainly be eagerly taken up."

MR. DAN ALBONE ON HIS "VICTORIA COMBINATION" VOITURETTE.

Exhibition at Antwerp.

ON the 23rd ultimo the Salon de l'Automobile et du Cycle, at Antwerp, closed its doors after an exceptionally successful display, during the course of which some 10,000 visitors made a tour of the thirty or so stands installed in the beautiful halls of the Société Royale d'Harmonie. This is the second occasion upon which the Salon has been promoted by the Syndicate of the Sporting Press of Antwerp, and unquestionably it is greatly conducive to the advance of the industry in Belgium. In the absence of the burgomaster, M. Jan Van Ryswijck, the task of formally opening the exhibition fell on Alderman Verspreuwen, and he was assisted by many of the city dignitaries. The gala day of the show, however, was that when Prince Albert of Belgium paid a visit to the exhibition, for the assembly of *chauffeurs* demonstrated their loyalty in no half-hearted fashion and accorded the Prince a right royal welcome.

Registration of Motor-Cars.

AT a meeting of the City of London Corporation last week the County Purposes Committee brought up a report in reference to a letter of the clerk to the Surrey Standing Joint Committee on the subject of the registration of motor-cars, with instructions to confer with the Police Committee thereon, and recommended "that a representation be made to the Local

Government Board as to the desirability of a registered number being affixed to all light locomotives, so as to provide for their more easy identification." The recommendation was agreed to.

America's First Automobile Race.

THE first real automobile race ever held in America was conducted on the 14th ult., on the famous Merrick road on Long Island, the start and finish being at Springfield and the turn at Babylon. Electricity carried off the honours of the day, with steam second and petrol a very good third. The race was under the auspices of the Automobile Club of America for a silver cup, donated by M. Léon Blanchet, of the Automobile Club of France. The distance was fifty miles and the competitors were started at intervals of thirty seconds to prevent confusion. Messrs. S. T. Davis, jr., V. Everett Macy, William H. Hall, A. L. Barber, jr., and David H. Morris drove steam carriages; and Messrs. Albert C. Bostwick, George F. Chamberlain, David Wolf Bishop, jr., J. C. McCoy, Jefferson Seligman, C. F. Weston, and A. Fischer drove petrol vehicles. Mr. C. J. Field, with Kenneth Skinner for his companion, drove a De Dion voiturette, and Mr. A. L. Riker had an electric racing carriage. The race was won by Riker in 2 h. 3 mins. 30 secs., with S. T. Davis (2 h. 18 mins. 27 secs.) and A. Fischer (2 h. 30 mins.), second and third respectively. Mr. Riker's vehicle carried sixty cells of batteries and weighed 2,500 lbs. A unique feature of the race was an unofficial contest between Mr. C. H. Tangeman and Mr. Riker. Mr. Tangeman was not entered in the race, but he started on his De Dion tricycle at the same time as Mr. Riker and beat the latter by nearly 5 minutes on the home stretch from Babylon to Springfield.

The Sultan's Automobile.

It is reported that the Sultan of Turkey is so delighted with the automobile supplied to him by a German firm of constructors, that he has conferred the Order of the Medjidieh upon Herr Kuhlstein, the works manager of the Charlottenburg factories, near Berlin, under whose direction the car was built. The automobile is already going far afield, for almost every week one hears of its use in countries many miles removed from the centres of its manufacture. In the French colonies on the north and west coasts of Africa several cars are employed, and their number would undoubtedly be largely increased but for the difficulty in obtaining petrol.

A CORRESPONDENT, signing himself "K. M. F.," writes:—"Could any of your readers recommend me a reliable motor for a sea-going dinghy, 11ft. by 4ft. A speed of 5 knots per hour would suffice."

UNITED MOTOR INDUSTRIES (Paris), 64 and 65, Holborn Viaduct, London, E.C., inform us that they have secured a renewal of the sole British agency for Messrs. Bassée and Michel, the well-known makers of coils, sparking plugs, etc., etc., and also for the "Universal" motor-tricycle saddle.

A FLORAL fête, organised to commemorate the raising of Bournemouth to the status of a county borough, was carried out on Wednesday with great success. As some valuable prizes were offered for the best decorated vehicles, best tableaux, and fancy costumes, there was a splendid show. One of the most interesting prize winners was a decorated motor-car, bearing the legend, "Looking Ahead."

MR. HENRY EDMUNDS, a member of the Automobile Club Committee, is offering a prize of £5, or, if preferred, a cup or object of art of that value, for the best twelve photographs taken on the 1,000-Mile Trial. Mr. Edmunds will select two members of the club committee to assist him in judging as to which is the best series of photographs submitted. The photographs selected are to be the property of the Automobile Club. Prints of photographs which are submitted for this competition should be mounted on cardboard and sent to the club under cover, marked "Photographic Competition."

The Automobile Club's 1,000-Mile Trial.

THIS Trial is now in the second week of its progress, and the results, so far, have completely justified those who urged the Automobile Club to embark on the undertaking. Such a contest, conducted without the incitement of great rewards or large gains, must assure the public with regard to the future of automobilism in this country, and prove to all that mechanical traction on our country roads is rapidly passing beyond the experimental stage, and is destined to play an important part in the transit of goods and the conveyance of passengers in the Twentieth Century.

The weather has been favourable on the whole, although the dryness has revealed a quantity of dust on our roads, which even veteran drivers of horse-drawn vehicles could hardly have regarded as possible. Those who have taken part in the tour have certainly experienced a succession of varying climatic conditions that must have proved exceptionally interesting to those unacquainted with the differences in temperature which make themselves felt over a long stretch of country in our little island, and many will be the reminiscences they will have to tell when they return to town as to the trials and ordeals they have undergone.

The first stages of the trip were duly chronicled in our issue of last week. From London to Bristol, and from Bristol to Birmingham, the trial took place through agricultural districts, and opened up delightful vistas of delightful English landscapes such as could never be realised from a railway carriage. Then from Birmingham to Manchester the aspect of the country changed, and on the cobbles of some of the Lancashire roads quite a different set of circumstances prevailed. The route from Carlisle to the modern Athens must have proved exceptionally interesting, and the day spent at Edinburgh yesterday (Thursday) was a really welcome change after more than a week of hard

week's reports. Next week's chronicle will tell of the return of the automobiles Londonwards, and the following concluding portion of the itinerary will be of interest as marking the later stages of the great Automobile Trial in the closing days of the nineteenth century:—

ON THE LONG PILGRIMAGE.

BY OBSERVER.

MANCHESTER, FRIDAY NIGHT.

EARLY this morning we were astir getting the vehicles ready, and despite the early hour a good concourse of people saw us leave Bingley Hall and start on our way for Sutton Coldfield to Dr. Johnson's ancient city of Lichfield. Sir Francis Jeune not long ago reminded us of the worthy doctor's suggestion as to travelling in a postchaise, and as the reflection as to his feeling with regard to motor-cars is obvious I will not pursue Dr. Johnson any further, but continue the chronicle of my journey with the interesting statement that breakfast was indulged in at Lichfield. From thence to Burton we went along steadily and well, nothing of importance passing us on the way, but it was clear from the muddy state of the roads that rain had fallen during the night, and so we had a condition that had befallen us but once so far.

It was market day at Derby, and we were cautioned to drive at nothing more than six miles an hour owing to that fact. Naturally the streets were abnormally crowded, and a quicker pace would have been both difficult and dangerous. Probably the only incident of importance—if such an affair can be deemed worthy of publication—was the attempt of a cow to enter a car: an adventure to be ascribed to the excitement of the animal's nerves and not to any idea of curiosity. Beyond Duffield the

[Mr. Edgar Scamell, Crouch Hill.

driving and riding. In the following pages we publish some interesting articles dealing with the progress of the cars from Birmingham to Edinburgh, and also some minor incidents in connection with the earlier stages which were crowded out of last

vehicles ran through the valley of the Derwent, and, passing through Bakewell to Macclesfield, permitted the tourists to enjoy a fine sample of Derbyshire scenery.

In the pleasant town of Matlock I took lunch—amid the most pleasant surroundings so far seen on the tour. Green hedgerows and long winding lanes may be the dream of the poet, but there is a pleasure and beauty of their own associated with the low stone walls that intersect the fields of Derbyshire, especially when there are hills to go up and hills to go down, giving one sensations of a peculiar and wonderful character. From Matlock to Bakewell was a grand run, and at all the corners on the way to Ashford little knots of people assembled to see the rather straggling procession. On the way out from Matlock an unfortunate accident occurred to one of the De Dion voitures, which had done very well in the early stages of the journey. The car had to cross a patch of stone, and this evidently proved a finishing touch to a latent flaw in the spindle of the near front wheel. The spindle snapped, and its fellow on the off front wheel followed suit, with the result that both wheels left the car, the fore part of which fell on to the road. But that was a mere incident in the campaign, and the rest of the cars went on, little heeding the pieces. Sometimes cyclists would venture to outpace us, but gave up after a few miles. One venturesome rider came up too

UNOFFICIAL OBSERVERS ON DUTY.

near our car, and was nearly knocked down as we suddenly stopped because of an obstruction in front. Why do men risk their lives for the little "cover" they get from a motor-car?

At Bakewell there were some peculiar styles of roads. Deep ruts had been covered with dressings of macadam, and one sharp flint, more obtrusive than its low-lying fellows, played upon the tire of the Wolseley voiturette. Still the other cars went on, their passengers truly thankful at escaping without breakdowns the fearsome character of these treacherous roads. Probably one of the most delightful parts of the "drive" was from Darley Dale to Rowsley, and not a few would have been glad to have turned into Chatsworth. But we were motoring, and motoring is not mere sightseeing. It is something more; some would say something less.

HILL CLIMBING AT TADDINGTON.

Taddington Hill is sixteen miles beyond Matlock and over two and a-half miles in length, with an average gradient of one in twenty-one. At places it is as stiff as one in twelve and a-half, so that it will be seen to constitute no particularly easy test. The ascent really began two and a-half miles from Ashford and finished at the sign post, about 140 yards from the summit, a little above Taddington village. Herewith I give the official figures in connection with the climb, which show that the general average was a very good one. It would have been interesting had the

time occupied by the cars in making the ascent been also given, but those who are curious on that point can work it out for themselves:—

		Miles per hour.

23	Brown-Whitney steam car	4.56

No. 35, a 6 h.p. Daimler, was very unfortunate in the fact that when about half-way up the hill the petrol gave up, and five minutes were lost in requisitioning the reserve supply—not an important matter on a 1,000-mile journey, but decidedly awkward on a hill-climbing contest for only two and a-half miles. The performances of the tricycle and quadricycle driven by Mr. A. J. Wilson and Mr. J. Stocks respectively are remarkable, but it must be borne in mind that the motors driving these vehicles are capable of assistance, and were in each case assisted by pedalling. The speed obtained by Mr. Rolls's car in ascending the hill, viz., 17½ miles per hour, was exceedingly good.

The hill climbing over, the journey was resumed, and into Buxton, with its stately and dignified aspect amid typical Peak scenery, the first of the "cars" was the "Century" motor-cycle. On the way to the Cat and Fiddle Inn many cars showed more trouble than up the previous hills, and there was a good deal of snorting and puffing and plodding. Macclesfield seemed delighted, and then we rushed into Manchester—whither some had preceded us, and many were to follow.

The order of getting on to the day's destination has been rather varied to-day, and instead of Messrs. Rolls and Edge occupying a twin position of honour they are in the third and fourth positions respectively, for Mr. J. R. Hargreaves' 12-h.p. Daimler and Mr. Alfred Harmsworth's 6-h.p. Parisian Daimler were before them. Other vehicles early into Cottonopolis were a M.C.C. Triumph, which was the first of the voiturettes, the Gladiator voiturette, a De Dion voiturette, No. 15, and the Empress bicycle ridden by Mr. Herbert Ashby. In this short list it will be seen the little cars occupy a good position, one of the remarkable results that is occasioning much comment among the ardent automobilists now assembling in the city.

KENDAL, Monday Night.

The first week of the Trial being over, some experience has been gained, with the result that for the first time the way was led this morning by a pilot car, an innovation which, had it been adopted earlier, would have given us more the appearance of a procession than has been the case, and the disappointment of many towns on account of the straggling way in which the cars arrived would have been avoided. Anyhow, this morning we streamed off in single file, with strict injunctions as to observance of the passing rule. As the first half of the day's journey lay through populous districts, a pilot car, that of the Hon. John Scott Montagu, M.P., with Mr. J. Slater, of Pendleton, on board, was deputed to lead the procession all the way to Preston, a distance of about thirty miles, and no car was allowed to pass it at any time. The remaining cars were also forbidden to change positions unless any of them were temporarily disabled or slowed

Daimler, a Star motor-car, the Locomobile steam car, and a Daimler phaeton, driven by Mr. Critchley.

At Preston there was a brief halt for breakfast, and then the journey was resumed for Lancaster and Kendal. We had an eight-miles-per-hour spell through Garstang ere reaching Lancaster, at which place, despite the short-time allowance for lunch, the local control officials unconsciously led the cars right through the town and away from the hotels before the signal for a halt was given. After luncheon in the old Lancastrian capital the journey was continued amid pleasant conditions, as not only had the early rains laid the dust, but the road surface was better, the country more picturesque, and a great deal of spontaneous enthusiasm was shown by the people of the rural localities through which we passed.

Again Mr. Rolls and Mr. Edge came first and second as regards the entry into the town of our night's stay, the third

PREPARING TO LEAVE CHELTENHAM.

[Mr. Argen' Archer, Kensington.]

down from any cause to a speed of less than eight miles an hour. This was the speed maintained through the various towns, while even on the open road the pace of the pilot car never exceeded twelve, as shown by the fact that Preston was not reached until close on ten o'clock, an average of nearly ten miles an hour. The places passed through were Pendleton, Bolton, and Chorley, and up to Bolton the roadway was paved with granite setts, which were not only very bumpy, but somewhat dangerously coated with grease, owing to the rain of yesterday, which confirmed one's impression of the legend that it always rains at Manchester. Among the members of the Manchester Automobile Club present to witness the start from Old Trafford were Messrs. D. H. Simpson, Frank Gresham, J. Hoyle Smith, and W. E. Rowcliffe, and the five cars to lead the procession in the wake of Mr. Montagu's were Mr. Kennard's Napier, Mr. Holder's

arrival at Kendal being the Ariel tricycle, with a Whippet detachable trailer. By permission of the Mayor and Corporation a very successful exhibition has been held in the Market Hall.

CLIMBING SHAP FELL.

The main interest of the day was centred in the optional hill climb on Shap Fell. Twenty-nine vehicles volunteered for this, and all except two succeeded in reaching the summit. From Mint Bridge, a little over a mile from Kendal, the ascent began, and continued with a few short and one very steep descent of half a mile to the summit of Shap Fell, ten and a-half miles from Kendal. The top is 1,400ft. high, and about 1,250ft. above Mint Bridge.

For the trial it was divided into two portions, with the steep declivity in between. Down this bit cars were instructed to travel as slowly as possible, to test brake power. The hill-

climbing test comprised (1) an ascent of seven and a quarter miles, during which there is a net rise of about 800ft., and (2) an ascent of one mile 686 yards, rising 500ft. The fastest car, driven by the Hon. Charles S. Rolls, took the first seven and a quarter miles at a speed exceeding twenty-four miles an hour, and, after a test of brake power down the dip which precedes the final rise, scaled the last mile and a half, including some hundred yards of a gradient of one in ten, at a rate of eighteen miles an hour. Second to this 12-h.p. French car came an English-made 8-h.p. car, which was very little slower. The

THE HILL-CLIMBING COMPETITION AT TADDINGTON HILL.

following list includes all cars making an average of over five miles an hour up Shap Fell (the steep part):—

	Miles per hour.
A 28 Mr. Hiffe's Enfield quadricycle	17.0
A 20 Mr. Ashby's Empress tricycle	14.48
A 17 Hon. C. S. Rolls's 12 h.p. Panhard	13.29
3 Ariel quadricycle	10.8
A 30 Mr. Siddeley's Parisian Daimler	9.3
31 M. C. C. Triumph (Renault)	9.3
26 Mr. C. Friswell's 8 h.p. Peugeot	8.9
4 Ariel tricycle and trailer	8.85
A 2 Mr. Butler's 6 h.p. Panhard	8.5
53 Wolseley voiturette	8.5
12 Motor Manufacturing Company's tricycle	8.2
37 Daimler Company's 6 h.p. Parisian	8.2
A 29 Mr. Mayhew's 7 h.p. Peugeot	7.7
14 De Dion voiturette	7.58
15 De Dion voiturette	7.58
5 Locomobile steam car	6.37
36 6 h.p. Daimler	6.12
35 6 h.p. Daimler	6.12
40 Wolseley voiturette	6.12
32 M.C.C. Triumph (Renault)	6.12

	Miles per hour.
A 31 Mr. Exe's Parisian Daimler	5.6
A 3 Mr. Browne's 6 h.p. Panhard	5.6
A 4 Mr. Mayhew's 8 h.p. Panhard	5.3
A 22 Mr. Holder's 12 h.p. Daimler	5.3

CARLISLE, Tuesday night.

To-day we have had the shortest run of the tour—only 61½ miles in length—but it included the ascent of Dunmail Raise and various other gradients, instead of starting at 7 a.m., we postponed the start for more than a couple of hours—a concession which even the earliest risers appreciated, for the Trial is proving something more than a lazy holiday. We have seen snow on the crags, and we have been up among the clouds, where the moisture probably affected the cars which had belt transmission gear. But fortunately my car was otherwise designed, and of the effects of moisture on belts I know nothing from personal experience. Running through Staveley and through Troutbeck Bridge to Grasmere *via* Ambleside, we had a comparatively quiet time, the latter part of the distance, however, requiring particular care and caution on the part of the motorist, owing to the narrow lanes and many corners which had to be negotiated.

UP DUNMAIL RAISE.

On Dunmail Raise there was a goodly company watching the struggles of the cars up the steeper parts of the long stretch, and much interest was evidently taken in the event. If they had expected to gaze upon failures they must have been disappointed, for all but two of the vehicles were timed up the ascent. The following is the official record of the cars whose average was more than 5 miles per hour:—

	Miles per hour.
A 24 Mr. Phillips' Mors Duc	17.9
A 28 Mr. Hiffe's Enfield quadricycle	17.06
A 17 Hon. C. S. Rolls' 12 h.p. Panhard	17.05
A 20 Mr. Ashby's Empress tricycle	15.80
3 Ariel quadricycle	10.8
14 De Dion voiturette	9.79
A 29 Mr. Mayhew's 7 h.p. Peugeot	9.79
5 Locomobile steam car	9.79
A 22 Mr. Holder's 12 h.p. Daimler	9.33
A 30 Mr. Siddeley's Daimler Parisian	9.33
31 M.C.C. Triumph (Renault)	9.33
26 Mr. Friswell's 8 h.p. Peugeot	8.92
53 Wolseley voiturette	8.155
A 3 Mr. Browne's 6 h.p. Panhard	8.22
37 Daimler Parisian	8.22
A 31 Mr. Exe's 6 h.p. Daimler Parisian	8.22
12 Motor Manufacturing Company's tricycle	8.22
40 Wolseley voiturette	7.9
35 6 h.p. Daimler	7.9
46 Richard car	7.9
4 Ariel tricycle and trailer	7.67
16 Gladiator voiturette	7.67
23 Brown Whitney steam car	7.67
45 S. S. Car	7.33
34 Decauville voiturette	7.08
A 12 Mr. Edmund's 6 h.p. Daimler	7.08
A 10 Mr. Kennard's 8 h.p. Napier	6.84
22 Lanchester car	6.84
2 1900 Benz Ideal	6.64
A 26 Mrs. Bazalgette's Benz car	6.64
27 New Orleans voiturette	6.64
36 6 h.p. Daimler	6.41
A 21 Mr. Pitman's 6 h.p. Daimler	6.04
49 Marshall car	5.86
8 Motor Manufacturing Company's 6 h.p. phaeton	5.86
44 International victoria	5.86
47 Richard car	5.86
33 Decauville voiturette	5.81
41 International victoria	5.55
9 Motor Manufacturing Company's 6 h.p. Iveagh phaeton	5.4
29 Eureka voiturette	5.4
A 11 Hon. J. S. Montagu's 12 h.p. Daimler	5.26
A 16 A. J. Wilson's Ariel tricycle	5.16
1 Hewetson's Benz	5.01

After the climb the run along the west side of Thirlmere by the new road was greatly appreciated, for not only was the surface in grand condition, but even automobilists are fully alive to the attractions of the environments. There is one terribly steep

rise before the lake is left behind, and it proved trying to some of the cars, while the last hill into Keswick was none too comfortable to descend. Luncheon was taken at the capital of Lakeland, and then we started off for Carlisle, about thirty-two miles further on, between Rothel and Thursby. Before getting to our destination for the day, Mr. Rolls had a flare up with his ignition-lamps and spoiled the appearance of his motor bonnet, but halted at a village wheelwright's and made smart again with white paint before entering Carlisle. The roads were in good order generally, but dusty, and at places there were annoying patches of flints newly laid on the road, to which one or two punctures are attributed, several machines reaching Carlisle with a tire down. The party were dust-begrimed when they arrived at the "control" at the Raffles, about a mile from Carlisle. The first in was Mr. S. F. Edge's party on the 8-h.p. Napier; the Ariel tricycle with trailer was next, and a few minutes later came Mr. J. W. Stocks on the Ariel quad. Mr. Mark Mayhew and Mr. T. B. Browne's Panhards were also early arrivals. To-night there is an exhibition, and to-morrow we set off on the last stage for the first half of the great Trial.

EDINBURGH, Wednesday Night.

Carlisle gave us an enthusiastic send off, and we have had a most enjoyable trip. The success of the venture is well assured, no fewer than fifty-four cars being reported as having left Carlisle this morning. The run through Gretna Green, Ecclefechan, Lockerbie, and Beattock, was delightful, although the sky was rather overcast and the roads inclined to be greasy. As the journey proceeded, however, there was an improvement, and the high wind that prevailed was at the backs of the motorists. At Lockerbie the roads proved very heavy, as was the case for a great part of the journey, and most of the passengers were bespattered with mud. Reaching Moffat the main road was left, and we proceeded to the hill-climbing trial on Birkhill.

ON BIRKHILL.

The climbing competition was held upon a course of just two miles, with a rise of 150ft. in the first mile, and 300ft. in the second. The gradient at its worst was one in eleven, and this was near the summit. The Hon. C. S. Rolls' car averaged 16 miles per hour, and would have done better but for a temporary trouble; and the Napier car, the Ariel tricycle with trailer, the Motor Mfg. Company's tricycle, and others, went up in good style. The medium-class cars also accomplished the ascent with credit, but sundry of the slow brigade were in difficulties until the passengers dismounted. In all forty-five cars were timed past the base, and they all succeeded in reaching the summit, the Locomobile steam car doing the trip at the rate of 10½ miles per hour. Next week I hope to give the official record of the times of the various cars.

Through picturesque scenery we went on to Innerleithen, where rain was encountered. Through the border counties generally there was a raw Scotch mist. The roads, however, were not at all heavy, and for most of the journey the motorists were able to thoroughly enjoy the variety of scenery through the Scottish lowlands. At Peebles there was evidently a half-holiday, and the crowd was great. Then to Edinburgh the cars were enthusiastically cheered, and we had done the first half of the Trial.

HOW THE CARS CAME INTO MANCHESTER.

BY MANCUNIAN.

AS "Fair Lancastria" prides itself on it being the case that, whatever its good people approve to-day, England will look upon with favour to-morrow—or something to that effect—we thought it might not be unprofitable to find out, as far as possible, what Manchester and district opinions on automobile matters were, as expressed by "the man in the street." With that end in view, therefore, we determined not only to keep our eyes upon the cars and their occupants, but to let our ears also do duty as we rubbed shoulders with the folks along the last two or three miles of the route from Birmingham to Cottonopolis.

The general impression of the expectant people, in the outlying districts, at all events, was that the cars would pass by *a la* a circus procession. A little "Tommy" or a "Mary Ellen" was stationed at the end of many a street, in order to "let nuther know when thaay coom," and the disappointment was very keen when the true condition of things was at length realised.

The little flags which were attached to the lampposts and elsewhere, and whose purpose was, of course, to indicate the route, and the turnings, and so forth, were a source of strange

TWO VIEWS OF THE CARS ON EXHIBITION AT THE BOTANICAL GARDENS, MANCHESTER.

Photos by

[Mr. Clarence Knight Gregson.]

comment. Some thought they were significant of welcome and criticised it as a stingy display, and we actually heard one old lady informing her inquisitive little grandson that why the flags were of various colours was "because it looked prettier." But she was more correct in her conclusion that he might *not* have a blue one after it was done with. The last we heard of the colloquy was "Will they send them to the war, grandma?"

At the point at which we then stood it was the sense of hearing which first realised the approach of the foremost car, and "expectation stood on tip-toe" until it hove in sight; and many and novel were the comments it and its occupants evoked. At short intervals, other cars went "putting" past, and strange were the names bestowed on the vehicles which in technical circles are designated voituresses, phaetons, broughams, victorias, etc. The variety and colours of the cars called forth admiration or condemnation in accordance with the preferences and predilections of the critics, whose reasoning we sometimes thought was as unaccountable as the poetic gentleman who wrote, "The reason why I cannot tell, I do not like thee, Dr. Fell." Mr. Harmsworth's car,

with its large expanse of burnished metal still shining through layers of dust, was on every side declared to be "a perfect beauty," and another car, over the destinies of which a lady presided, was gallantly acclaimed. And of course the inevitable khaki was there, and duly commented upon.

But if the cars came in for "quizzing," their occupants were treated in the same way, only more so. The "goggles" were subject to jocular remarks generally speaking, but one good-hearted dame sought to excuse their use in one case by hazarding the belief that the wearer had weak eyes. The hollows of the eyes of those who did not wear protectors presented the appearance of a *comédienne's* after a liberal application of belladonna.

As in the case of the goggles, so with the clothing; for the people did not seem to understand that when rattling along and cutting through the air at, perhaps, a score of miles an hour, it is absolutely necessary to be protected from the cold and dust; and therefore the wearing of leather and oil-skin coats, furs, wraps, Sou' westers, slouch hats, tweed caps with ear-flaps, and so on, was regarded less in the light of utility than as the eccentricity of automobile genius. But as the philosopher says that there's many an honest heart beats beneath a ragged coat, so beneath that ollapodrida of apparel were fashionable garments that saw their sartorial birth in Bond Street.

Here and there we noticed a disposition on the part of the drivers of horse-vehicles to be disagreeable, and in one instance such conduct necessitated the speedy stoppage of the motor-car, but this was so well accomplished that it earned the audibly-expressed admiration of the on-lookers. One amusing little episode we may here record. There was heard a shout of "Here's a big 'un!"—but it turned out to be a steam roller that had just turned the corner.

At the junction of Barlowmoor Road and Seymour Grove, there was a fair concourse of people, anxious to watch the cars sweep round the curve; and so anxious was one British workman to impress the fame of the locality upon the occupants of a certain Daimler car that he shouted (pointing to a marked spot on the wall), "Hi, guv'nor, this is where Charlie Peace shot the hobby!"

It was really too inconsiderate of the powers-that-be to select that very day for re-macadamising the Old Trafford end of Seymour Grove. For some distance the entire breadth of the roadway was laid with rough new stones, and here and there were heaps of stones just deposited. A steam roller was also at work and blocking the traffic. The observations of the by-standers were not complimentary to whomsoever was responsible for the unfortunate choice of a day and hour to begin such drastic road repairing.

At the Deaf and Dumb Asylum, at the corner of Boyer Street and Stretford Road—a few hundred yards on being the Botanical Gardens, the goal of the motorcarists—a lot of the deaf-mutes were interested spectators, and even if one were not familiar with the finger language and display of pantomime, the lads' animated countenances were sufficiently indicative of their admiration. But chancing to know something of the manual alphabet, we asked one little fellow what he thought of a car that had just passed, and he replied, "Goes very fast." But the query, Would he like to have a ride on it? caused him to pout his lips and shake his head—whereupon several of his companions nodded and smiled, and tapped their fingers on their breasts, to signify "We would." Wise little boys!

By this time we are very nearly at the Botanical Gardens, which are in Old Trafford. The Gardens are too far from the city to have brought a big miscellaneous crowd, nor to say the truth are they popular with the proletariat—for which relief the pious inhabitants of the district often ejaculate "Thank Heaven!"

The arrangements of the local committee seemed to be excellent. The carriage entrance to the gardens has an ugly centre stone against which the folded gates are bolted when shut; and an official was thoughtfully told off to warn the car-drivers to exercise due care. The way the steering apparatus answered was quite a theme of remark to those uninitiated into the mysteries of autocarism. After Mr. A. Heatly, the honorary timekeeper, had taken the necessary particulars the cars entered the glass-domed buildings and took up their places for the exhibition on

the morrow. And here parenthetically we may tell that we noticed a well-known gentleman cleaning up his car with all the affection with which a mother washes her first baby.

A long interval having elapsed without the arrival of a car, we cycled off to meet any belated ones. At Chorlton-cum-Hardy we saw one being dragged along by a "growler," and could not help thinking, "Oh, what a falling off was there!" and indeed it looked as if there had literally been a falling off for the occupants.

Thence we wheeled towards Didsbury, past the Crematorium and Southern Cemetery—and an ominous place of buried hopes of getting in first it must have seemed to the occupants of a slow travelling car we met, but who were nevertheless bravely endeavouring to wear a look indicative of "Oh, we might have been earlier if we had chosen!"

And now may the present writer make a suggestion? If it be that this 1,000-mile Trial has largely been induced by a desire to educate the public on the subject of motor-vehicles, would it not be well to select a halting place a few miles out of the large cities and towns visited, where all the cars would collect and thence travel at short distances apart? There would then

A BUSY SCENE.

be opportunity to make accurate comparisons and awaken the interest of those whose alliance with the movement would be very valuable.

THE EXHIBITION AT MANCHESTER.

BRISTOL, Cheltenham, and Birmingham having been favoured with exhibitions of the competing vehicles, it was only fitting that Manchester should also have its one day's display. Some have wondered why Liverpool was omitted from the itinerary; but it must be remembered that, thanks to the efforts of the Liverpool Self-Propelled Traffic Association, the maritime city is far more familiar with automobiles than the textile centre. And so the work of education was devoted to Cottonopolis. Our special correspondent describes elsewhere the reception accorded by the populace; and it is interesting to know that the commercial men and others of influence in the industrial world also gave heed to the coming of the motor-vehicle.

The Royal Botanical Gardens, in which the Exhibition was held on Friday last, presented an unusual sight as the cars were negotiated round and about the flower beds—an exercise that tested the capacity and skill of the drivers to a considerable degree.

The exhibition was opened by the Lord Mayor of Manchester

(Mr. Thomas Briggs). There was a large attendance at the opening ceremony, and great interest was taken in the fifty cars or more on exhibition. Mr. W. E. Rowcliffe, of Manchester, presided, and the Mayor of Salford (Alderman S. Rudman) was among those present.

The Chairman, before calling upon the Lord Mayor, said that in the near future something would be done in the form of power traction in regard to warfare. There could be no doubt that sooner or later mechanical power would supersede horses. There was and had been a gradual evolution of the battery for storing electricity, and so by degrees reducing the weight to such an extent that it would become a practical commodity. As soon as they were able to secure a battery which with a minimum amount of weight would take storage and run for a period of, say, ten hours, it might be reasonably expected that so soon would all large towns, within reasonable distance of each other, have their own electrical installation with charging stations. Electricity would perhaps be the most popular motive power. It

would still last, it was important that the sum in hand, which now amounted to about £44,000, should be increased. He had great pleasure in declaring the exhibition open.

Mr. S. Okell, of the Manchester Club, proposed a vote of thanks to the Lord Mayor.

The Hon. J. S. Montagu, M.P., seconded the motion, and recalled the importance of Manchester in the early days of the railways, and expressed the belief that the city would move ahead rapidly in England in regard to motor-cars. He said that all the way from London the occupants of the cars had met with nothing but good-will in the towns and villages they had passed through.

The motion was supported by Mr. J. Hoyle Smith, and adopted.

The Lord Justice Clerk of Scotland (the Right Hon. J. H. A. Macdonald, C.B.), in proposing a similar vote to the Manchester Automobile Club, said that if he had announced only a few years ago that he was about to undertake a trip such as they were engaged upon he would have been told that he was mad. The riders

Photos by

SCENES AT THE BOTANICAL GARDENS, MANCHESTER.

[Mr. Percy Richardson,

was almost free from noise, had no smell or oscillation, was entirely under the control of the driver, and not explosive. Therefore there was no risk to either life or limb, and one was enabled to go almost any distance.

The Lord Mayor said that on looking round the exhibition he had come to the conclusion that a great improvement had been made in the design of the cars. He believed, with the chairman, that the cars of the future would be run by electricity, but in the meantime oil and steam were found to be very satisfactory substitutes. If motorists intended, however, to have public opinion with them, they must be cautious and remember that other people had rights to the road as well as they. There was no doubt that motor-cars would prevent a good deal of cruelty to horses, particularly where long journeys had to be made. He was particularly pleased to know that the proceeds of the exhibition would be handed over to the local War Fund. They were distributing now about £1,000 a week in relief, and more would be wanted. As there was no telling how long the war

would have been received with the jeers of the grown-up and perhaps with the stones of the younger population. He remarked that people in the towns showed their confidence by standing nearer to the cars than they would have done if horses had been attached to them. With regard to the effect on horses of the driving of motor-cars, he said he believed that horses themselves had more sense in the matter than the ordinary population. They were apt to suppose the horse did not understand the cars, and was set in a state of excitement by them. He appealed to all who had been on that expedition to confirm his statement that not one horse in two hundred took the slightest notice of a motor-car, unless his driver was nervous and would not quietly leave the horse to take events as they happened. He thought the public had begun to see that the motor-car had come to stay. In the crowded Manchester streets motor-cars would occupy about half as much space as vehicles drawn by horses, would turn more easily, and would never jib, plunge, or kick over the traces. Nothing could happen as long as the

driver kept his head and other people kept theirs. In conclusion, he commented on the extraordinary rapidity with which a motor-car could be brought to a stand as compared with a vehicle drawn by horses.

The Hon. C. S. Rolls seconded, and Mr. Henry Sturmer supported the resolution, which was cordially adopted.

The proceedings were shortly afterwards brought to a close.

REFLECTIONS AT CARLISLE.

BY A WORLDLING.

IT is Tuesday evening. Those of us who have survived the hills of the North have tasted of the hospitality of Carlisle, and have found it not wanting in any respect. The smoking room of the County Hotel has been turned for the moment into a *chauffeurs' tabac-papier*, where we have laughed over the disasters of our friends, and boasted of our deeds of "derring do," till the rafters—if there are such things in modern hotels—rang with wondrous tales of hill-climbing and *virages* that have set at naught the principles of dynamics to which we were trained in our school days.

That of which we have been talking the most is the wonderful performance of Mr. S. F. Edge on his Napier car. On one of the hills between Keswick and Carlisle—I speak only from hearsay—he missed his change of speed, and owing to the faulty arrangement of his brake, began to travel backwards at about twenty miles an hour. With that presence of mind which is his chief characteristic he told Mr. Kennard and young Mr. Cusens to jump from the car, and steered her backwards on to the upward grade behind him. Two or three minutes of adjustment and all was well again, and the twelve miles an hour or thereabouts, which the car subsequently developed, brought him first into Carlisle.

The hill-climbing competitions have been a bit trying to the nerves and tempers of many of us. I never felt so angry in all my life as when I was running the gauntlet of a thousand or so cameras on slow speed. At the top of Dunmail, whizz past me went Mr. Ashby on his tricycle, but I got a little consolation when Mr. A. C. Edge, Mr. Stocks, and an Ariel quad came by, all three walking up the steeper part. By the way, their machine has got the best record after Mr. Rolls' Panhard, which is, of course, much faster up hills, and which, I regret to see, is credited with a pace above the legal limit.

What surprises me more than anything is the way in which the small fry are getting through. I passed a boy gazing sadly on a Victoria Combination that, he said, had something wrong with its "innards," ten miles from anywhere on the Cat and Fiddle road, and yet that same youth smiled encouragingly on me to-day as he sailed past me at Bassenthwaite, where I had stopped for some small repair. Two cars were incapacitated to-day by broken countershafts, but I hear that some lightning repair work has been done, and that they will be on the road again to-morrow. A Star car, which we all thought was a corpse, turned up again smiling to-day, and there are similar illustrations hourly of the fact that the dead automobile is as rare a bird as Sam Weller's dead donkey.

The nicest place we have stopped at yet is Kendal, where we slept, or tried to sleep, last night. I regret to say it was all trying in my case, because my room, in a perfectly delightful little hotel called the Dolphin, was opposite a church with a clock. There is nothing particularly unusual about that, but as luck would have it the machinery working the chimes had broken down, and the ringing of them had been entrusted to some fiend who amused himself by playing patriotic tunes all night. Nobody seemed to have heard them but myself, so I must add that the Dolphin is a temperance hotel. From an æsthetic point of view the tour is not a success. Covered with dust and dirt, on cars laden with petrol and oil cans, spare tires, &c., we must appear singularly unprepossessing to the thousands of people who daily watch our flight. I wonder if they understand that a superlative degree of uncleanness is not necessarily part of the price to be paid for the delights of

automobilism, and that the *chauffeur* is sometimes clean. I am personally rather worried by noticing that girls, who under other conditions would turn their eyes away from my masculine gaze, now stare at me with a boldness which is only made the more disgraceful by the inevitable giggle which accompanies it. Am I a freak that I should be treated in this way?

NEARING THE BORDER.

CARLISLE, Tuesday.

AT the time of writing the Automobile Club's educational course in the geography of our own country (as we may not unfitly term the 1,000-mile Trial) is still in progress. Up to the present our total cumulative mileage tots up to 447½ miles, and we rest to-night in the fair city of Carlisle, only eighteen and a-half miles short of the Scottish border. Not, mark you, that we are so many Dr. Syntaxes in search of the picturesque. Neither, on the other hand, are we (or at the least of it should we be) motor scorers emulative of pace. Ours are aims of another sort: to form a kind of perambulating object-lesson in the appearance and capabilities of motor-cars in those benighted regions that do not already know them well, and to collect a mass of carefully-noted data for the use of the Automobile Club and for the industry in general. When we have finished this pilgrims' progress, and the long story of our several and collective doings is duly digested, we shall be certificated, medalled, and bonused until we shall scarce be able to recognise ourselves. We shall not, like the hymn-singers, at the end of our journey wear a crown in the New Jerusalem, but we (or those among us who are in the industry) will be able to sport things almost as pretty and a great deal more useful. We shall, that is to say, be enabled to show the would-be motorist, shivering on the brink of automobilism, and yet afraid to make the change from the horsed to the horseless vehicle that we can climb gradients of 1 in 9 for three weeks on end; that we can descend pitches of equal steepness at very much less than a walking pace if we want to do so; and that "from morn to dewy eve," as the poet remarks, we can urge the flying wheel, coming up dusty, but smiling, at the end. There may have been those who, hearing of this 1,000 miles or so of travelling, have waited to hear of early breaks down by wholesale. If such there were, they are disillusioned by now. As Mr. W. S. Gilbert says, in the "Mikado":—

"Perhaps you suppose this throng
Can't keep it up all day long.
If that's your idea you're wrong."

The throng (or most of them) have kept it up all day, and for nine days up to date. That is to say, of the sixty-four actual starters, fifty-five had actually arrived at the Butter Market, Carlisle, up to 8 o'clock this evening, a very small wastage when one considers the severe tests of endurance which the eleven miles of uneven granite setts between Manchester and Preston and the trying hills of the Lake country have imposed. The nine cars that are missing may, indeed, be arriving even now, for we have no official pronouncement of their final dropping out, and even if they do not keep the twelve-mile record throughout, those of Section I. are still eligible for the £10 *Daily Mail* premium, to be awarded to those which perform an average throughout of five miles an hour.

But what of the tour from Friday last? Friday seems a long way back, so far have we come and so varied have our experiences been. The seven o'clock start from Birmingham on that morning was duly made, amid cold and lowering weather, so that when we reached the end of the long Birmingham control at Sutton Coldfield, 7¼ miles out, and had, in accordance with official regulations, to stop there for the due filling in of cards, there were not a few who, shivering in the blasts that swept across the open country at that point, found Sutton Coldfield well named. Thence to Lichfield, where those of us who had not breakfasted employed the half hour's stop for that meal in stoking the human machine. There is a Cathedral at Lichfield, but few or none saw it. At nine o'clock we all pressed on to Burton-on-Trent, and thence to Derby and Matlock. Here the coy and fitful sun at length condescended to shine, and rendered the luncheon—three-

quarters of an hour—pleasant. Also, which was more important, it showed off the assemblage of cars to advantage before the crowds which gathered out of curiosity and stayed to admire. We have marched onwards since 1896, and no one can deny the taste and real beauty of many of the cars in this representative assemblage. Happily, we had little dust this day, and were not so travel-stained as on the phenomenally dusty trip from London to Bristol. Here, therefore, the neat finish and handsome painting of the big carriage-built cars were well in evidence. Of the

coach days, with its post-office red wheels and black and red body. Mr. Alfred Harmsworth's A 7, a Parisian Daimler, is a quiet shade of green. Several cars are painted in a slate or French grey colour, which does not betray the dust, including A 17, the Hon. C. S. Rolls' 12 h.p. Panhard; A 22, Mr. Holder's 12 h.p. Daimler; and A 31 the Secretary's 6 h.p. Parisian Daimler. One in Section I., a Daimler, No. 36, is of the same hue. These do not exhaust the pretty colours. Section I. has in No. 27, a New Orleans car entered by Messrs. Burford, Van Toll and

THE MOTOR-CARS IN LAKE LAND.

[Mr. Percy Richardson.

fourteen English and Parisian Daimlers, the seven Panhards, the numerous Benz's, Peugeot's, Napier's, and De Dions, many are finished in light and cheerful hues, and were much admired by the knowing ones. Of course Section II., the A, or amateur's class, was chiefly in evidence in this respect. A 2, Mr. Frank H. Butler's 6 h.p. Panhard, is a daring but successful "confection" (as the milliners say) in pure white upper body and sealing-wax red lower frame and wheels. Then there is Mr. T. B. Browne's, A 3, Panhard, which reminded some old stagers of the old mail-

Company, a charming finish in gamboge; a Daimler in light brown; two or three more Daimlers in blue-green; a Richard car (No. 46) in black and crimson lake; and two Marshall carriages in yellow and black. To return to the A class, No. 19, Mr. Hargreaves' big yellow and black Daimler, looks among the smartest.

Of course, with this long tour before us, we go somewhat heavy laden with luggage and with spare odds and ends that may be needed on the journey. For instance, the extra tires

carried by many of the cars, which, slung on behind, perhaps detracted from our neatness to the rear view, and looked oddly like lifebelts. Fortified with lunch, for the climbing of Taddington Hill, that 4,440 yards of varying gradients ranging from 1 in 12½ to 1 in 200, we did it with ease; passing, half way up, that treacherous bend by the roadside quarry where two brakeless cyclists descending with the wind at their backs were killed at Eastertide. We looked at the spot with interest, and, thinking of the much steeper descents before us, in Cumberland, dwelt with satisfaction upon the fact that every motor-car is provided with a plenitude of powerful and reliable brakes, calculated to safely bring a car to a standstill within six or seven yards. Tea at stately Buxton, and thence to the ascent among the Derbyshire limestone crags up to the wind-swept "Cat and Fiddle" Inn, supposed to be the highest situated inn in England. Manchester, at the end of the day's run, was reached by the foremost cars about 5.30 p.m. Hitherto we had come through enthusiastic crowds, but Manchester and its neighbourhood were strangely apathetic. No cheering school-children as of yore, no crowds,

A CHAT ON THE ROAD.

and few locally-owned cars to meet us. We drove into the Botanical Gardens at Old Trafford, where the public exhibition of cars took place that evening, and on the next day, Saturday. It was, after all, well attended, and by crowds of well-dressed Manchester people. An odd thing is that go-ahead, shrewd, business-like Manchester has not yet taken up with the motor-car movement, and up to our advent horseless vehicles had been rare in her streets. Even the Lord Mayor of Manchester, who officially declared the exhibition open, patronised and chid us a little. Speaking to one of us, a Manchester man (one always speaks of "Manchester men," just as one always says "London cockneys," "Paisley bodies," and "Yorkshire bites") let the secret out. "Manchester," said he, "always likes to be first in any enterprise, and if she *isn't* first, won't take it up afterwards with a good grace." So there you have it!

Sunday was kept quietly, and rain made the day somewhat dismal; but Monday made amends, even though the roads were greasy and the setts already mentioned from Manchester, through Pendleton, Horwich, Bolton, and Preston made our pilgrimage somewhat penitential, by reason of jolting. Happily, we all came through without a smash, which incidentally proves the good workmanship of motor-cars in general, for no more cruel test than this could be applied. Fortunately for me who rode, the setts came to an end at Preston, and the roads for the rest of the day were perfect. Popular enthusiasm began again at Bolton, and continued with us for the rest of the day, through Lancaster, where a halt was called for lunch, right away to Kendal, our stopping-place for the day's run, where the whole town made holiday to witness our arrival and to visit the evening exhibition. We arrived at various times in the afternoon, and twenty-nine cars afterwards took part in the optional

climbing of Shap Fell, which involved an out-and-home run from Kendal of twenty miles. It is a ten-miles climb up to the bleak expanse of Shap Common, 1,400ft. above sea-level, with gradients of 1 in 10, 1 in 13, 1 in 15, and so on, down to 1 in 25, with an intermediate descent of 600 yards from Huck's Brow to Huck's Bridge, with a gradient of 1 in 10, which had to be descended as slowly as possible. This involved practically restarting from a stop at the bottom, where an immediate ascent of 1 in 11 faced the assemblage. That the cars did it bravely is excellent testimony to their powers; but it entailed hard work upon the 2½ and 3-h.p. engines of the motor-tricycles, and upon their riders, who aided their machines by pedalling up. We were all glad to descend again from the bleak plateau at the summit, and came back to Kendal helter-skelter.

Starting this (Tuesday) morning from Kendal at 9.30, we had the compulsory hill-climbing of Dunmail Raise on our itinerary. We came to it by way of Windermere, whose waters looked a cold steely blue in the chary sunshine of this backward spring, by Ambleside, and by romantic Rydal Water. Dunmail Raise is a 1½ mile climb, with successive gradients of 1 in 17, 1 in 15, 17, 11, 12, 13, 15, and then to the trying stretch of 166 yards of 1 in 8½, after which it eases off to the summit. The official times are not yet issued (at this time of writing), but nearly all, it is understood, successfully negotiated the Raise. Thence by Thirlmere and its rock-girt road, followed by a steep and large drop into Keswick, we arrived early at Carlisle, the first to reach here being Mr. S. F. Edge, driving A10 and the Ariel tri cycle, with the Whippet detachable trailer, at the same moment. Carlisle is in the thick of a race meeting, but the evening exhibition in the Butter Market has been exceedingly well attended. To-morrow we run to Edinburgh, our most northerly point, starting, thank goodness, at 9.30 a.m., instead of the more usual 7 a.m., a time when the world is not yet properly aired, and when, at this season, and in these northern latitudes, the air still bites shrewdly.

SOME EXPERIENCES.

French v. English Cars.

ONE pleasing feature of the Trial, and one upon which British manufacturers are to be congratulated, is the conclusion forced upon all who have followed the trip as to the excellence of the 6 h.p. English cars. These have evidenced a running ability equal to the much-vaunted 6 h.p. Panhards, and have demonstrated that English firms will ultimately hold a very high position in the automobile world.

Children and Motor-Cars.

So deep has been the interest aroused in the Trial that in most of the schools along the route in Derbyshire and Lancashire work was suspended in the morning or afternoon to allow the children to see the automobiles. Doubtless the occasion will be regarded as a great event, and certainly the action was well calculated to get the motors "talked about."

The First Three Days.

ON the first day of the Trial sixty cars arrived at Bristol out of the sixty-four that started from London, and forty-four averaged 12 miles an hour; on the second day—from Bristol to Birmingham—fifty-nine cars arrived at the latter place, thirty-four of which averaged 12 miles, and on the run from Birmingham to Manchester thirty-one out of fifty-two which reached the Lancashire city were up to the legal limit. There seems a little confusion as to the actual number that started from Grosvenor Place. Our own observers—stationed at two different points—gave the number of starters at sixty-four, but a report received from Bristol gives the number at sixty-seven. Anyhow, all such little variations may be expected to be cleared up by Mr. Johnson—when he gets a few minutes to spare.

Three Little Incidents.

As the Trial has gone forward the incidents which gave a zest to the performances of the first two or three days have not been repeated, and the contest is settling down into an uneventful parade of reliable and steady cars. On the day of the hill climbing at Taddington Hill there were only three little mishaps to chronicle, and they were of quite minor importance. In one case a governor was broken in the neighbourhood of Lichfield, the victim being the Richard car. In the other a De Dion voiturette broke its front spindle outside Matlock Bridge, but nobody was hurt. A passenger fell out of the car of the Hon. S. C. Rolls while it was descending from the Cat and Fiddle to Macclesfield; altogether a trio of really unimportant matters—unless the descending passenger has a different opinion to offer.

The County Surveyors.

ALMOST without exception the county surveyors have given excellent facilities to the motorists, and their practical appreciation of the new movement has been well demonstrated. On the cars leaving Manchester the county surveyor for the Salford Hundred had a seat on Mr. Montagu's car as far as Horwich, and directed the driver at the difficult points of the route, and another county surveyor accompanied the car to Kendal.

Journalistic Slips.

JOURNALISTS have followed the Trial with interest, and have apparently enjoyed themselves changing from one car to another with all the enthusiasm of expert judges trying the capabilities of an equine stud. Some of their slips of the pen have been curious. The Benz Ideal car has appeared as the Bentz and as the Bean Ideal. Because of its name, the "New Orleans" car has been described as of American origin, and the *Daily News* man, whose descriptive matter has been about the best of that appearing in the general press, went into Kendal on the hind seat of "an aerial tricycle with whippet detachable trailer." He will be trying a flying machine next.

A Festive Gathering.

ON Saturday evening the members of the Automobile Clubs of Manchester and London were entertained at dinner at the Conservative Club at Manchester by Mr. Henry Edmunds, who is a member of both clubs. In toasting the Manchester Club, Mr. C. Johnson, secretary of the London Club, spoke with pleasure of its excellent arrangements in connection with the trials, and said that the place selected for the exhibition had been eminently satisfactory.

Northern Horses.

IT is very clear that the horses in some of the northern parts of England through which the cars have journeyed are not so well accustomed to the automobile as those of the south. Some have shown a coyness, a shyness, and, sometimes, a restlessness which was never noticed during the earlier stages of the journey, and one collided with Mr. Siddeley's car breaking its leg and disabling the vehicle until the local smith at Keswick put things right.

Horses Undisturbed.

THE horses on the road from London to Bristol were evidently desirous of sustaining their reputation for good behaviour, and the motorists had nothing to say as to any equine want of manners. At the start we noticed several grooms accustoming their horses to the motors as they stood at ease in Grosvenor Place, and correspondents on the route testify to similar training having been observed near Newbury, Beckington, Box, and other places.

INCIDENTS.

AMONG the visitors at the exhibition at Cheltenham was Mr. J. W. Boughton, of St. John's, Worcester, who proceeded thither on his motor-car, which is said to be the only vehicle of the kind privately owned in the Faithful City.

OWING to the breaking of the chain of the Brown-Whitney steam car the water tank was perforated. Otherwise a better average would have been obtained on the run from London to Bristol.

SEVERAL cars skidded on the tram lines at Bath, where recent rain had made them greasy.

THE first car into Newbury was that driven by Mr. S. F. Edge. The Hon. C. S. Rolls was second. At Bristol, these two were still leading although in reversed positions.

NEAR Newbury, Lord Carnarvon drove over a part of the course on his Panhard car, and among other motorists observed near that town were Mr. and Mrs. Neville Cross, of Inkpen, Berkshire.

FROM Worcester the car of Messrs. Roots and Venables mistook the turning at Barbourne and went to Ombersley where the supply pipe for the oil was broken. Fastened to the back of a cart the vehicle proceeded to Droitwich where the necessary repairs were made.

THE Mayor of Lichfield invited the citizens to welcome the automobilists by decorating the houses on the line of the route with flags, etc.

SAID the *Times* on Monday morning: "So far the tour has been free from accident to any member of the public, and nothing more serious to the competitors than an involuntary but harmless fall from one of the cars at a sharp corner has to be recorded."

THE longest "control" was that from Manchester to Preston, a distance of thirty miles along a road which is practi-

ENJOYING THE VIEW.

cally that of a continuous town, and the greater part of which is lined with cobbles.

THE Hon. J. Scott Montagu, M.P., interviewed at Gloucester, spoke in high terms of the condition of the roads on the Gloucestershire side of Bristol, and also contrasted the courteous conduct of the police of the county with the brusqueness shown by the authorities in some other districts.

EN ROUTE.

BIRMINGHAM.

Thursday last was rather a dull day in Birmingham, and at least one automobilist took the opportunity of the chance to run up to London. Late in the afternoon some stir was created by the unexpected arrival of Mr. Alfred Harmsworth's splendid 12 h.p. Panhard, which was driven in from Reading. At the exhibition in Bingley Hall the attendance was larger than was anticipated, and much interest was shown in the construction of the machines by the greater portion of the visitors, many of whom were manufacturers and others desirous of becoming acquainted with the mechanism of the various vehicles. From noon, when the exhibition opened, until the closing hour, ten o'clock, there was a steady inflow of visitors.

The official records concerning the run from Bristol to Birmingham, via Cheltenham (92½ miles), which took place on Wednesday last week—the roads being hard, but dusty; weather fine—show that the following motor-vehicles in the manufacturers' and agents' section completed the journey at a speed up to the legal limit of twelve miles an hour, namely:—

- Nos. 1 and 2, Benz "Ideals."
- No. 3, "Ariel" quadricycle.
- No. 4, "Ariel" tricycle, with Whippet trailer.
- No. 7, Motor Manufacturing Company's 12-h.p. phaeton.
- No. 9, Motor Manufacturing Company's "Iveagh" phaeton, 6-h.p.
- Nos. 14 and 15, De Dion voituresses.
- No. 16, Motor Power Company's "Gladiator" voiturette.
- No. 19, Automobile Association's "Orient Express."
- No. 20, Motor-Carriage Supply Company's "Simms' Motor Wheel."
- Nos. 21 and 22, Lanchester Engine Company's 8-h.p. carriages.
- No. 23, Brown-Whitney steam car.
- No. 26, Friswell's 8-h.p. Peugeot.
- No. 27, Burford, Van Toll's 3½-h.p. "New Orleans" car.
- Nos. 31 and 32, Motor-Car Company's 3½-h.p. "Triumphs."
- No. 34, Motor-Car Company's 3½-h.p. Decauville.
- Nos. 35 and 36, The Daimler Company's 6-h.p. carriages.
- No. 37, The Daimler Company's 6-h.p. Parisian car.
- No. 39, "Century" Tandem Tricycle.
- No. 40, Wolseley Company's voiturette.
- Nos. 41 and 44, International Company's 3-h.p. Victorias.
- Nos. 46 and 47, Automobile Manufacturing Company's 7-h.p. "Richard" cars.
- No. 49, Marshall and Company's 5-h.p. carriage.
- No. 51, Star Motor Company's voiturette.

In the Section for privately-owned vehicles, the following completed the journey at a speed up to the legal limit:—

- No. A 2, Mr. Frank Butler's 6-h.p. Panhard.
- No. A 3, Mr. T. B. Browne's 6-h.p. Panhard.
- No. A 4, Mr. Mark Mayhew's 8-h.p. Panhard.
- No. A 7, Mr. Alfred Harmsworth's 6-h.p. Parisian Daimler.
- No. A 10, Mr. Edward Kennard's 8-h.p. Napier.
- No. A 11, the Hon. John Scott Montagu's 12-h.p. Daimler.
- No. A 12, Mr. Henry Edmunds' 6-h.p. Daimler.
- No. A 16, Mr. A. J. Wilson's "Ariel" tricycle.
- No. A 17, the Hon. C. S. Rolls' 12-h.p. Panhard.
- No. A 20, Mr. Herbert Ashby's "Empress" tricycle.
- No. A 21, Mr. Ernest Pitman's 6-h.p. Daimler.
- No. A 22, Mr. J. Holder's 12-h.p. Daimler.
- No. A 23, Mr. Charles Cordingley's 6½-h.p. Motor Manufacturing Co.'s phaeton.
- No. A 24, Mr. Robert Phillips's 4-h.p. Mors car.
- No. A 26, Mr. C. K. Gregson's 6-h.p. Daimler phaeton.
- No. A 28, Mr. E. M. Iliffe's 2½-h.p. Enfield quadricycle.
- No. A 30, Mr. J. D. Siddeley's 6-h.p. Parisian Daimler.
- No. A 31, Mr. W. Exe's 6-h.p. Parisian Daimler.

DERBY.

In any case there would have been a crowd here, but the fact that it was market day and that some of the schools were closed in honour of St. George and Automobile Day, helped to swell the

crowds. Some excitement was caused by restive horses, but all, even the police, were willing to acknowledge that excitement on that account was caused by the carelessness of the drivers rather than by the presence of the cars.

MATLOCK.

Here, beneath the shadow of the High Tor, a great deal of interest was taken in the tour, and it was confidently predicted by many of the knowing ones that the cars would find the hills of Derbyshire too much. At the local schools the children had been given a holiday, and they, of course, cheered to the echo. The police gave every assistance, and the only matter that aroused concern was the upsetting of a furniture van in trying to get out of the way of one of the cars.

LANCASTER.

The presence of the motor-cars at Lancaster attracted a good deal of attention. Very few were much behind the scheduled time. The roads from Preston were in excellent order, and the journey was made with ease and comfort. The police arranged the route so that the cars passed through several streets instead of passing straight through the town, and the parade created a good deal of interest. The party stayed over an hour in the town, and lunched at the King's Arms Hotel, the cars meanwhile being on exhibition in Parliament Street, where an interested company inspected them and made various inquiries. One or two cars needed re-adjustment, but there were no casualties requiring serious repairs, and the ease with which sharp corners were negotiated in the progress through the town was remarkable.

CARLISLE.

The counter-attraction of the local spring race meeting robbed the arrival of the cars in Carlisle of a good deal of the interest they would otherwise have excited; but even as it was, hundreds of spectators turned out to watch the entry of the party into the Butter Market, where the vehicles remained on exhibition during Tuesday evening. After the first of the cars arrived, every few minutes a fresh vehicle turned the sharp corner into the market entrance, and fifty-five cars were counted during the afternoon. The weather enjoyed on the way was brilliantly fine, but the begrimed appearance of both cars and occupants showed clearly how dusty the roads had been. The beauty of the scenery of the Lake district came as a revelation to the foreigners who are of the company, and scores of snapshots were secured during this part of the journey.

EDINBURGH.

The local time-keepers were taken by surprise, and the occupants of the first few cars had to wait awhile. The first car to arrive was a Napier motor, driven by Mr. S. F. Edge. The next, a 12-h.p. Panhard, driven by the Hon. C. S. Rolls, passed the red flags a quarter of a minute later. The others arrived as follows:—Ariel tricycle with Whippet trailer for extra passenger. E. S. Cheel, driver; Daimler Parisian, driver G. White; Mr. J. A. Holder's 12-h.p. Daimler; Mr. Mark Mayhew's 7-h.p. Peugeot, driven by D. Haxton; Mr. J. W. Stocks on his Ariel quadricycle; Mr. E. Buck on the Motor Manufacturing Company's tricycle; the Hon. J. Scott Montagu, M.P., on his 12-h.p. Daimler; Mr. Friswell on his 8-h.p. Peugeot; Century tandem tricycle driven by S. Begbie; and Mr. T. B. Browne's 6-h.p. Panhard. As one car after another passed along, occupants and everything white with dust, no little stir was occasioned, and all along the route to the Waverley Market soon became crowded. The "inward control" at Liberton Brae were Messrs. A. Alexander, of the Cyclists' Touring Club, and W. L. Sleight, of the Scottish Automobile Club; while the "outward control" with white flags at the Bridges were Messrs. Normand Macdonald and John Macdonald. At the Waverley Market the cards were obtained from the drivers, and a note of the time of their arrival at the Market taken, and the card signed by the timekeeper there. An exhibition of the vehicles took place within the Waverley Market yesterday (Thursday), among the attractions announced being an exhibition of motor driving by Mr. E. J. Coles, who recently performed at the Agricultural Hall exhibition.

THE DAIMLER PUBLIC SERVICE CHAR-A-BANC.

—S—

THE vehicle illustrated herewith has been designed for the Daimler Motor Company, Limited, Coventry, by Mr. Sidney Straker, A.M.I.C.E., the consulting engineer to the company, specially for its employment in public service to meet with the approval of licensing committees, and to comply with the demands of the public for cheap conveyance. The construction throughout is of a different practice to that previously embodied in the company's manufactures. The strength and general arrangements of the vehicle provide for a normal load of eleven persons, capable of being exceeded within reasonable limits. The tare weight is given as 28 cwt., so its classification comes under Section 3 of Article 2 of the Locomotives on Highways Act. The motive power is a two-cylinder Daimler engine, standardised to give a propulsive effort of 9 h.p. The use of sprockets and chains is eliminated, the engine being directly geared to the road wheels through the intermediary of a clutch, a universal joint being employed as the connecting link between the sprung and unsprung portions of the vehicle, the company's object being to produce a vehicle of a somewhat heavier and more durable description than has hitherto been brought into use, and to travel at speeds suited to its requirements.

Both axles are inclined or set to provide for the employment of dished wheels, the advantages claimed being a material increase in stability due to the power of resistance to bending of axles, which is a prevailing tendency in all vehicles, especially when excessive loads are carried.

The water cooling of the motor cylinder is arranged on the radiator practice with the provision of a centrifugal direct-geared circulating pump, having a branch of two deliveries to facilitate circulation.

The steering is designed to embody a vertical pillar with worm and wheel. The variable speed gear changes provide for three speeds only, it being found in practice that for public service a fourth speed is unnecessary. The changes are five, seven, and twelve miles per hour, with motor running at the normal velocity of 650 revs. per minute. From the change-speed gear case, which is the terminal portion of the sprung part of the frame, the drive is transmitted through a universal joint by means of bevel wheels, and through differential gears to the two transverse countershafts which carry the pinions gearing direct with the circular racks mounted on the spokes of the road wheels. The gear case and sleeves in which the gearing and transverse shafts are contained are made in cast steel and are fixed to the back axle and entirely encased; this is also the same with the change-speed gear box, all being built in steel, so that rigidity and the practice of oil-bath lubrication are ensured.

The two axles are tied together by perches and tie rods, joints being interposed in this connection and in the vertical central line with the universal joint drive, so that as the sprung portion of the vehicle ascends and descends the under carriage reciprocates up and down, thus retaining a constant distance between the two axles and between the joint centre of the under-

frame, vertically with the sprung frame, and providing for the jolting of the vehicle due to the unevenness of the road without throwing any strain upon the drive or working parts.

Two brakes are attached to the vehicle, the one on the countershaft being a double purchase brake actuated by the same foot pedal which throws the clutch in and out of gear; only a downward movement of the foot lever is required to perform the double function, the traverse being about 4 in. The first inch of depression disengages the clutch, and the other three engage the brake to an extent that will, it is claimed, hold the vehicle on an incline of one in six. The secondary brake is a positive double-grip brake actuated equally well under the conditions of forward or reverse movements; it grips on two brake pulleys secured to the hubs of the back wheels.

The lubrication is automatic throughout, sufficient feeders being provided on the dashboard for the regulation of all the important bearings. The car is entirely controlled by the steering wheel and the one-foot pedal. The tires are of solid rubber vulcanised on to the iron rims fitting on the felloes. The new car is now being put through its paces in the 1,000-mile Trial, and the latest reports received show that it is going steadily and well through the various stages.

THE NEW DAIMLER PUBLIC SERVICE WAGONETTE.

A RUMOUR that has been current this week in automobile circles is that Mr. M. D. Rucker is to be appointed the European representative of the recently-formed Anglo-American Rapid Vehicle Company.

In addition to the solid tires described in our report of the recent Motor-Car Exhibition, the Sirdar Rubber Company, Limited, also exhibited their patent pneumatic motor tire treads and covers. These are compressed both laterally and longitudinally, and are endless, so that they can be bound on to the pneumatic

tires in addition to the usual solution or vulcanising applied. If these treads and covers are cut lengthways or across they automatically close up, and do not wear ragged, and if a little solution is put in the cut as it presses together the cover will unite and no appreciable injury is done.

LA COMPAGNIE BELGE DE CONSTRUCTION D'AUTOMOBILES, of Brussels, which has a capital of £10,000, reports a profit of 639fr. (£25) for last year.

MR. T. R. OUTHWAITE, the manager of the Edinburgh Autocar Company, has betaken himself lately to the track with his De Dion motor-tricycle. We understand that he intends to have a trial shortly to test the full-speed capabilities of his new machine.

THE Eadie Manufacturing Company, Limited, Redditch, is now fitting a new 2½-h.p. De Dion engine to their motor-quadracycles. The Eadie Company obtained a consignment of the very first 2½-h.p. motors sent into this country from Paris, and are now prepared to give prompt delivery of quadracycles fitted with the same.

It may be of interest to note that the magnificent ride accomplished by Baras from Paris to Roubaix, when he equalled the express train time, although he had twelve kilometres further to travel and encountered thirty kilometres of *pave en route*, was done by the aid of a motor fitted with the Buchet *cubess*.

MOTOR-CARS ON THE CONTINENT.

(From our Correspondent.)

A Permanent Automobile Exhibition in Berlin.

DIE AUTOMOBILAUSTELLUNG GESELLSCHAFT is the title of a company which has just been formed in Berlin, on the initiative of Count Talleyrand-Périgord, to establish a permanent motor-car exhibition in the German capital. The new company also intends to open up business for motor manufacturers and makers of parts and accessories, and to deal in patents relating to the industry. It will also open motor driving schools, where beginners may be instructed in the manipulation of motor vehicles.

Another New Club.

STILL they come! At Béziers a new automobile club has just been promoted under the title of the Moto-Club Biterrois, and the intention of its members to place their society in the front rank of provincial organisations is manifested by the issue of a circular announcing an automobile meet for Monday, June 4th. On that occasion there will be a race in which separate classes will exist for cars, voiturettes, and cycles. Only local automobilists will be eligible to compete for the three handsome cups put up as prizes, but as the Languedoc boasts of several prominent *chauffeurs*, the contest in each section is certain to be pretty keen. A battle of flowers, too, is being organised for Tuesday, May 8th, so the new club is losing no time in getting to work. The committee consists of MM. Georges Prot, president; Alexandre Terral and Balthier, vice-presidents; F. Rieusset, secretary; Fourcade, assistant secretary; Izard, treasurer. Good luck to them!

Records.

THE three days' automobile meet at Turin concluded, Gasté still remained in the town, and on the afternoon of the 26th ultimo he went out on the Stupinigi road to have a dash at a few short distance records. The route selected was slightly uphill, and this told heavily against his chance of setting up fresh figures, but in one instance he proved successful, knocking one-fifth of a second off Béconnais' record for the two kilometres with flying start. Gasté's times were:—

1	kilometre from stationary start	... 57 $\frac{3}{4}$ sec.
1	" " flying " "	... 42 $\frac{1}{2}$ sec.
2	" " " " " "	... 102sec.

Another excellent performance has to be recorded, and this is the time recently made over one kilometre with flying start on the famous Achères road by M. Caron, an amateur rider. This gentleman actually covered the distance in 39 $\frac{1}{2}$ sec., so equalling the record made by Béconnais at Nice in March last, and would probably have made an even faster performance but for the strong wind against which he had to battle. It is but very seldom that an amateur aspires to beat the times achieved by his professional brethren.

The 100 Kilometres at Lille.

ON Sunday last there was decided on the Lille track the 100-kilometre motor-cycle race organised by *Le Vélo*, in place of the original course from Paris to Lille, this year prohibited by the Prefect of the Seine-et-Oise, whose department was traversed by a portion of the selected route. This 100-kilometre race would appear to have been promoted not only to please the good people of Lille, whose disappointment at the forced abandonment of their annual fixture was very great, but also to lodge a protest against the suppression of road races. The organisers having decided to make their course one of invitation only, selected as competitors half a dozen of the fastest motor cyclists of the day. Five of these are well known by name to English readers, these being MM. Béconnais, Baras, Osmond, Rigal, and Fossier, while the sixth, Bathiat, is generally regarded as the champion of Northern France, and was selected as the local representative. Favoured with magnificent summer-like

weather the course attracted a goodly crowd, who were rewarded by seeing some exciting racing. The six competitors were despatched at 4.27 p.m., and ere the completion of the first lap Rigal abandoned the struggle owing to the breakage of eight spokes of one of his wheels. Baras momentarily took the lead, but appeared hardly comfortable on the track, and soon lost the pride of place to Fossier. Fossier made the five kilometres in 5min. 15sec. and the ten kilometres in 11min. 2sec., his immediate attendants at the latter distance being Béconnais and Osmond. The latter broke his ignition plug at the sixteenth kilometre, and was compelled to retire for a time, thus leaving Fossier and Béconnais to fight it out for first place. Twenty kilometres were covered by Fossier in 21min. 45sec. and thirty kilometres in 34min. 2sec., but he was severely handicapped by the damaged condition of one of his tires, and after passing the forty-fifth kilometre he commenced to ride on the rim. It was at this point that Béconnais took the lead, and Fossier's progress being impeded by his tire, Baras secured the second place, only to immediately lose it by reason of a bad puncture. Osmond, too, seems to have had an extraordinary career, for, after replacing the damaged plug, the head of the cylinder broke, and then a series of punctures completed his tale of woe. Béconnais' time for the 56 kilometres was 55min. 30sec., and he covered 54 kilometres 130 mètres within the hour. Fossier continued to ride, seated on the petrol tank of his machine and minus a tire, but he was always losing ground, and at the seventy-fifth kilometre Bathiat went up into second place. The 90 kilometres were covered by Béconnais in 1h. 40min. 40sec., and then, just when the race appeared all over bar shouting, a broken piston pulled the leader up short. Only ten laps to go, and so Béconnais set to work, and by means of pedalling and pushing accomplished those ten laps, but not before Bathiat had caught up and passed him. The official return of this race of mishaps was as follows:—

1. Bathiat, in 1h. 53min. 44sec.
2. Béconnais, in 1h. 58min. 22sec.
3. Fossier, twelve laps behind.
4. Baras, who covered 62 kil. 400 mètres.
5. Osmond, " 59 " 600 "
6. Rigal.

If really speedy performances are to be made on the track, the number of competitors should be limited to two or three, as any increase over that number renders the work extremely dangerous, and renders fast times impossible.

The Rallye Auto-Club.

IT is at Meulan that the recently-formed Rallye Auto-Club has established its chalet, and it would be difficult to find within easy distance of Paris a more charming spot. Beautifully situated, and with several fine reaches of the Seine in close proximity, it appeals particularly to those automobilists who are fond of boating and sailing, and during the summer months very many *chauffeurs* will certainly avail themselves regularly of this opportunity of combining their pleasures by land and water. On Sunday last the chalet was formally inaugurated in the presence of some fifty members of the club, all of whom had journeyed out from town on their cars. The day had been specially selected for this little ceremony on account of the automobile canoe regatta, promoted by the Cercle de la Voile, taking place during the afternoon. It is hoped that the motor-launch trade will be helped forward considerably by the coming of the Rallye Club to Meulan, and that ere long petroleum regattas will be quite the order of the day.

Touring Competition.

As for the moment, at any rate, the races of the Exhibition, in common with all other automobile courses, have gone by the board, the organising committee has prepared a series of rules and regulations governing a *concours de tourisme* destined to take place from May 14th to 19th. In this contest no competitor will be permitted to travel at a greater speed than 20 kilometres per hour in populated districts, or in excess of 30 kilometres per hour in the open country. Accurate note of the consump-

tion of fuel, or expenditure of energy in the case of the electric vehicles, will be made, and reports will also be prepared on the conduct of the motor, the facility of steering, the action of the brakes, and the general comfortability of the vehicle. There will be four categories, all for vehicles exceeding 400 kilos in weight—two, four, six, and more than six-seated cars, all of which must be comfortably built and upholstered, and provided with a reverse speed. Intending competitors should send in their inscriptions, accompanied by the 200 fr. entry fee, on or before the 12th inst., to the Automobile Club of France. They must at the same time forward a photograph and drawing of the vehicle and of the motor. They are required to quote the sale price of the car and the apportionment of its weight upon the axles. Further they must specify the fuel employed and the quantity necessary for a day's journey, indicating also whether the vehicle will require a fresh supply in order to accomplish the task required by the commission. Handsome prizes will be awarded to the successful competitors, and the jury's report will be sent to the Society of Civil Engineers of France and to the leading foreign automobiles clubs. The itineraries selected are as follows:—

MONDAY, 14TH, WEDNESDAY, 16TH, AND SATURDAY, 19TH.

Morning.

Leave Vincennes at	9 o'clock
Joinville...	6 kil. 500
Champigny	3 kil.
Ozouer	13 kil.
Croissy	7 kil. 500
Malnoue...	5 kil. 500
Villiers-sur-Marne	4 kil.
Bry	2 kil.
Nogent	3 kil.
Fontenay	2 kil.
Vincennes	2 kil.

48 kil. 500

Afternoon.

Leave Vincennes at	1 o'clock.
Joinville	6 kil. 500
Créteil	2 kil.
Choisy-le-Roi	6 kil.
Croix-de-Berny	8 kil.
Petit-Bicêtre	7 kil.
Versailles	4 kil.
Buc	4 kil. 700
Toussus	4 kil. 200
Châteaufort	1 kil. 500
Saint-Rémy	5 kil.
Orsay	8 kil.
Palaiseau	5 kil.
Wissous	8 kil.
Villeneuve-Saint-Georges	9 kil.
Valenton	3 kil.
Créteil	5 kil.
Joinville	3 kil.
Vincennes	6 kil. 500

96 kil. 400

TUESDAY, 15TH, AND FRIDAY, 18TH.

Morning.

Leave Vincennes at	9 o'clock
Fontenay	2 kil.
Neuilly-sur-Marne	5 kil.
Chelles	6 kil.
Pomponne	7 kil.
Thorigny	2 kil.
Cornetin	2 kil.
Fort de Vaujours	10 kil.
Clichy-sous-Bois	4 kil.
Gagny	3 kil.
Rosny	4 kil.
Fontenay-sous-Bois	3 kil.
Vincennes	2 kil.

50 kil.

Afternoon.

Leave Vincennes at	1 o'clock
Joinville-le-Pont	6 kil. 500
Créteil	4 kil.
Villeneuve-Saint-Georges	8 kil.
Montgeron	3 kil.
Lieusaint	11 kil.
Melun	13 kil.
Savigny-le-Temple	7 kil.
Corbeil	9 kil.
Champrosay	9 kil.
Villeneuve-Saint-Georges	18 kil.
Vincennes	18 kil.

96 kil. 500

Whether this will compensate for the last *courses* remains to be seen, but I very much doubt whether the general public will take much, if any, interest in the proceedings.

At the A.C.F.

I LEARN that M. Bourdil will officially represent the Automobile Club of France during the 1,000 mile Trial, organised by the Automobile Club of Great Britain. It is M. Bourdil's intention to join the tour at Edinburgh, and travel with the cars right through to London. The membership of the A.C.F. continues to increase, and by the election of fourteen new members last week the grand total was brought up to 2,329. Among these new members I notice the name of Mr. Mark Mayhew, the others being MM. Arnold Deutz, Arthur de Boschan, Edmond Guillomot, O. de Rangabe, Edouard Lattes, Stephen Thorn, Pandia Petrocokino, Henry Cachard, Gustave Caltain, Edouard Caltain, Eugène de Freystadtler, David Bishop, and Frédéric Manaut. To my mind the most interesting place in the club now is the "garage," which has long since lost the empty appearance it presented the first few days subsequent to the opening. To-day one sees within its spacious halls a wonderful variety of cars, while the passage of automobiles to and fro marks the club unmistakably as an Automobile Club, an appearance it rather lacked formerly.

La Criterium de l'Electricité.

ONE frequently hears the complaint from the supporters of electric traction that their system is grievously slighted in the matter of competitions and races, and that practically all the encouragement and attention is bestowed upon the petrol cars. Well, there is a good deal of truth in the remark, but, on the other hand, constructors of electromobiles have partly to thank themselves for this condition of affairs, for when an event is organised for them they support it but very poorly. The "Criterium de l'Electricité" is a case in point. Promoted by "Le Velo," this event had for object the demonstration of the staying powers of electrically-propelled vehicles and its regulations were framed on the easiest of lines. What happens? Only three constructors respond to the invitation! Out of the many makers of electromobiles only three are courageous enough to put their productions to a public test! Make all the excuses possible, the exhibition, the orders on hand, etc., etc., and one cannot explain away the apathy displayed by the electric people towards this competition specially organised in their interests. But to deal with the contest itself. As the test was one of endurance only, with the sole proviso that the average speed maintained should be at least sixteen kilomètres (ten miles) per hour, a course of impossible length for electric cars was selected. This was Paris-Dijon, a distance of some 350 kilomètres, which is at present just a shade beyond the scope of an electromobile on one charge. Two optional times of departure were given to the three competitors, one at 8 a.m. and the other at 10 p.m., and it was at the former of these that M. Cuvelier, mounted on his little car, which only carries 480 kilos of accumulators, made a start on his voyage of discovery. The early portion of this car's career was con-

ducted against a strong head wind, but nevertheless a creditable performance was achieved, the total distance eventually covered being 140 kilomètres (87½ miles), over a fairly trying route. M. Krieger's car not putting in an appearance at the appointed time on the evening of the 26th inst., the B.G.S. vehicle started alone, having on board MM. Garcin, Bouquet, and Prade. Unfortunately, at Villeneuve-la-Guyard a short circuit was produced in the controller, and after a couple of hours' work the idea of proceeding further was abandoned and the occupants of the car had to rest content with the ninety-two kilomètres already covered. As for M. Krieger, who, as above stated, was behind time at the *contrôle de départ*, well, once started, he made excellent progress, and eventually completely outdistanced his rivals. The car which he drove was of the well-known "Duc" type, carrying the accumulators in front. These accumulators weighed 1,032 kilos, and the total weight of the vehicle was 1,980 kilos, while the passenger accounted for an additional 160 kilos. The record of the run made by this car was 152 kilomètres, the point of stoppage being some 8 kilomètres beyond Joigny, and this distance was covered at an average speed of 16 kilomètres 84 mètres per hour. No accident whatever occurred to mar the perfect harmony of the run, and, as well may be imagined, M. Krieger was delighted with his victory. He hopes that next year he will be able to place on the market a vehicle with a range of 250 kilomètres; at any rate, it will be a car possessing infinitely greater staying powers than those of this year's competitor, and if this anticipation is realised, we shall see within a few years the Paris-Dijon journey made on a single charge.

The Criterium Liégois Race.

THE Automobile Club Liégois has issued the programme of the Criterium race, which is to be run off on June 10th. The competition is open for (1) motor-cycles or cars weighing less than 400 kilogrammes, and not having two seats side by side; (2) two-seated *voiturettes* weighing less than 400 kilogrammes, (a) costing less than 3,500fr. and (b) between 3,500fr. and 5,500fr.; (3) cars weighing not less than 400 kilogrammes, (a) less than 10 h.p., (b) more than 10 h.p. The route is from Liège to Spa and back, a distance of 115 kilomètres, a compulsory stop of one hour to be made at Spa. The rules provide that the average speed must not be greater than 30 kilomètres per hour, while in the case of the cars and the *voiturettes*, they will be required to stop one minute on a hill and restart on a given signal.

BOURNEMOUTH MOTORS, LIMITED, is the title of a company which has been registered, with a capital of £4,500, to manufacture and deal with motor omnibuses, cars, wagons, cycles, and vehicles.

At the City Police-court, Lincoln, last week, Wm. Binks, cycle manufacturer, was summoned for driving a locomotive in High Street and Guildhall Street on the 19th ult. at a greater speed than was reasonable. P.C. Taylor gave evidence, and defendant was fined £2.

THE Brechin County Road Board have resolved to have the clauses of the Highways (Scotland) Act, 1896, bearing on the speed at which motor-vehicles should travel and providing for their being stopped when passing restive horses printed separately and posted on prominent places throughout the county. The Board has also decided to petition the Local Government Board in favour of a denoting mark or number being made compulsory on all light locomotives.

MR. FRANK F. WELLINGTON, 36, St. George's Square, Regent's Park Road, London, N.W., informs us that he has purchased the business of the Motor Development Corporation, Limited (Tube Department), of which he has hitherto acted as manager. The business will be carried on at the foregoing address under the style of Frank F. Wellington, and in conjunction with this he will also trade in the buying and selling of new and second-hand motors, motor-cars, motor-cycles, etc.

CORRESPONDENCE.

THE CARRIAGE OF PETROL ON RAILWAYS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in informing you that I have received information that the railway companies are approaching the matter of the objectionable Clause 2 in the new consignment note and regulations for inflammable liquids, Class A, in such a manner that there is every reason to hope for an early alteration of these regulations on reasonable and possible lines.

I would wish to take this opportunity of mentioning how great has been the part of Mr. Charles Sangster, of the Cycle Components Company, in bringing this about. He has taken the greatest personal interest in the matter, and by his persistent energy has most materially assisted the work of the Motor Trades Association.—Yours faithfully,

G. H. SMITH, Hon. Sec.,
Motor Trades Association, Ltd.

64, Holborn Viaduct, London, May 2, 1900.

THE annual racing festival of the Catford Cycling Club will be held to-morrow, the 5th inst., at Catford Track. A motor-cycle race is included in the programme.

PRINCE D'ARENBERG, a well-known patron of the motor-car sport in France, has offered to the sporting committee of the French Automobile Club a sum of 1,000 francs (£40) as a prize for a race in which the competing vehicles are driven by motors using alcohol instead of petrol. The committee have accepted the offer.

A COMPANY has been registered under the title of Bennett and Carlisle, Limited, to acquire and carry on the business of motor and cycle agents and factors now carried on under the style of J. A. Bennett and Co. at Manchester. The nominal capital of the company is £2,000. The registered office is situate at 9, Ward's Buildings, Deansgate, Manchester.

THE Caledonian Motor-Car and Cycle Company, Limited, of Aberdeen, have despatched to Edinburgh a Caledonia motor public service car, specially built to the order of Mr. J. W. Gilchrist, Bonnington Road, Leith. Although the top speed of the car is only ten miles, the run to Edinburgh was accomplished in sixteen hours' running time.

AT the Hove Petty Session on Monday, Mr. Lewis, 31, St. Ann's Hill, Wandsworth, pleaded guilty to driving a motor-car upon the footpath by the side of the London Road at Patcham, on April 12.—P.C. Brown said defendant drove his car on the footpath for a distance of 90 yards. Defendant, in mitigation, produced a parcel of big flints, and said the road was strewn with them, and it would have done considerable damage to his car to have driven over the flints. The Chairman: That may be very disagreeable but its no defence. A fine of 1s. and 9s. costs was imposed.

THOMAS SENDALL STEVENS, of Earlsdon, Coventry, was summoned at Warwick, last week, for not stopping his motor-car when signalled by the owner of a restive horse. Mr. Madeley Burman, farmer, Wootton Grange, said defendant did not stop when witness held up his hand and also shouted to him. His horse backed some distance, and his wife was much alarmed.—Mr. Lloyd Evans corroborated this evidence. Defendant said he stopped as soon as Mr. Burman shouted, but he did not see his hand held up. The Mayor said the public must be protected, and fined defendant three guineas and costs.

TIRE punctures are always a factor to be reckoned with, however stout the tires may appear to be, and therefore owners of light motor-cars and cycles fitted with pneumatics should always be prepared for emergencies by carrying a repair outfit with them. The Dunlop Pneumatic Tire Company, Limited, have sent us a sample of the outfit they have lately put on the market for this purpose. It consists of a handy little metal box, 3in. by 4in., containing all the necessary articles for repairing punctured tires, including prepared patches, a small square of rubber, glass paper, French chalk, canvas, a tube of solution, and finally a useful little tire lever.

ROAD LOCOMOTION.

A MEETING of the Institution of Mechanical Engineers was held on Thursday last week in their new house at Storey's Gate, St. James's Park, W., when a paper on "Road Locomotion" was read by Professor H. S. Hele-Shaw, who after an introductory statement concerning the revival of road locomotion by motor-vehicles proceeded to deal with the mechanical problem of the behaviour of the wheel on the road, the question of steering and turning, and lastly with the subject of motive power, which was divided into internal combustion motors or oil engines, external combustion motors (steam), and electrical motors. He compared the advantages and disadvantages of these three kinds of motive power, and observed that though at present oil engines were used for light motor-vehicles and steam for heavy traffic, there were very ingenious steam motor-cars both in this country and abroad, while light oil engines had been applied in France and also in this country in connection with heavy traffic. Moreover, there were other kinds of motive power, such for instance as compressed air, which was being tried in America. Oil engines had, by a process of the survival of the fittest, been found so far best suited for light motors or pleasure vehicles. Electrical motors were clean, extremely convenient and simple, and altogether an ideal type of motor, but the limitations in the use of electricity were very serious. The whole problem of the use of electricity was determined by the life and capacity of the battery, and the merits of any accumulator should really be judged to a great extent by the condition of its batteries after six months' daily use in a motor-vehicle. Looking at the whole question, the Professor remarked that it might be safely said that the motor-vehicle had come to stay, and that its uses both in peace and war would rapidly develop. Though the motor-vehicle was at present still somewhat of a *rara avis* on our roads, it might not be going too far to think that the coming century would see a development of locomotion on roads comparable with the development of locomotion of the railway in the century now closing. The paper was illustrated with wall diagrams and twelve plates of figures.

Mr. Aspinall, the general manager of the Lancashire and Yorkshire Railway, in opening the discussion, said he had come to the conclusion, after exhaustive trial by his company in Liverpool and Manchester, that Thornycroft's vehicle was, at the present time, the best for all-round rough work. Although the results had been fairly satisfactory he was afraid that they could not say that motors were cheaper than horses in all respects. Until they had had more experience they could not finally decide the point. The Liverpool Self-propelled Traction Association had certainly made trials, but he feared that they were purely experimental. The association tried its best to prove that motors were cheaper than the antiquated railways, but he did not think that they had quite succeeded. It was perhaps rather unkind for the railway company to give the horseless trolley the first trial in Liverpool, but he assured the Liverpool Association that when they were in possession of more results he would then let them have them. He had just returned from a quiet part of France, where walking was made intolerable on the roads through the reckless driving of motor-cars. He hoped, therefore, that in all trials in England due respect would be paid to the law, else the new and great promising engineering industry would fall into the hands of the Frenchman. If the public were led to believe that the new vehicles were unsafe, great damage would be done to the industry.

After a few words from Mr. Thornycroft on the question of tires, and from Mr. J. Brown, of Belfast, on his "viagraph," it was decided to adjourn further discussion until June.

In moving a vote of thanks to the lecturer, Mr. Shrapnell Smith, the secretary of the Liverpool Self-Propelled Traffic Association, replied to Mr. Aspinall. The latter had said that little had been heard of late of the association, and had poked fun at them. He assured Mr. Aspinall that the association was still in existence, and would shortly be heard of again. Although the L. and Y. Railway trials had been with long weights and over short and intermittent distances, the results were useful and welcome to his association. Mr. Aspinall claimed to have introduced heavy, horseless traction into Liverpool in a practical way. He reminded him, therefore, that the Corporation of Liverpool and the Mersey Docks and Harbour Board had purchased such vehicles.

Professor Boyes seconded the motion, which was carried unanimously.

THE STORAGE OF PETROL.

At Bristol Police Court, on Tuesday, Mr. John Stevens, cycle agent, Church Road, St. George, was summoned for violating the conditions of a petroleum licence granted to him by keeping sixty gallons in excess of the quantity permitted by the licence. Mr. Roberts (from the Town Clerk's office) prosecuted, and explained that the defendant was granted a temporary petroleum licence to sell to the drivers of the motor-cars visiting Bristol, the quantity specified being forty gallons. Inspector Thompson found on the premises twenty five-gallon tanks—sixty gallons more than the licence authorised defendant to keep. It was a serious case, as petrol was very inflammable, and the premises were not suitable for the storage of such a quantity. Inspector Thompson said that on Saturday afternoon, the 21st ult., he visited premises situated behind defendant's house, in Church Road, St. George, where John Stevens had obtained a temporary petroleum licence authorising him to keep forty gallons. He found twenty tanks, each containing five gallons of petrol. He again visited the premises in the evening, in company with Inspector Durbin, and found the same quantity of petrol. Each

tank had a paper label attached to it. He called the defendant's attention to the excess, and he said he thought the licence permitted him to keep any quantity above that mentioned in the licence. Defendant said that he applied at St. George Police-station for a petroleum licence, and did not mention any quantity. He was told that he would be sent some application forms. A constable brought two forms to his house. One was a blank one, and he was told that he must fill it up like the other, on which was mentioned the quantity, forty gallons. He accordingly filled in the form, applying for a licence to keep forty gallons. He thought he could keep forty gallons without a licence, and that if he paid for a licence he could keep any quantity over. He was making no profit out of it; he simply sold it as an advertisement to get the motor-cars out into the district. The bench fined him five guineas and costs, taking into consideration the fact that the oil had been forfeited, and cautioned him to make himself better acquainted with the law.

RENAULT v. MOTOR-CAR COMPANY.

IN the Chancery Division, on the 25th ult., Mr. Justice Kekewich, on the application of Mr. Israel Davis, granted leave to serve notice of motion, with the writ, for Friday in this action, which is brought to restrain the defendants from doing certain acts of which the plaintiff complained.

THE BEESTON MOTOR COMPANY.

MR. JUSTICE COZENS-HARDY, sitting for Mr. Justice Wright, in the Chancery Division, on the 26th ult., had before him a petition presented by Mr. H. Osbaldeston Duncan for the compulsory winding up of the Beeston Motor Company. Mr. O. Leigh Clare appeared for the petitioner, and Mr. Martelli represented the company. Mr. Martelli stated that the petitioner was a creditor for a small amount. The answer to the petition was that the property of the company was in the hands of a Receiver for the debenture holders, and there would probably be no surplus for the creditors. The Receiver was actually negotiating for the sale of the property, and he would give the petitioner all information as to the proposed contract. Petitioner wanted to see that the property was realised to the best advantage. He asked that the petition might be ordered to stand over for a fortnight. Mr. Justice Cozens-Hardy assented.

FURIOUS DRIVING CASE.

BEFORE the Bournemouth Borough Bench, last week, Sidney Mitlett, of Wickham Road, Pokesdown, pleaded guilty to furiously driving a motor-car in the Square, Bournemouth. P.C. Haywood, who proved the case, said the defendant was going at a speed of twelve miles an hour. Defendant was fined 2s. 6d. and costs.

THE "Locomobile" Company of America, of New York, and 52, Sussex Place, South Kensington, W., have sent us a copy of their new catalogue, which gives particulars of the "Locomobile" steam car. The list is neatly printed and includes illustrations of several styles of these now well-known vehicles.

THE proposed service of motor-cars between Aberdeen and Torry, to which we referred in a previous issue, is now assuming definite shape. A meeting of those favourable to the scheme was held in Torry on Friday last week, when a committee was appointed to collect information as to police regulations, price of cars, etc., and to report to a further meeting.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, MAY 12, 1900.

[No. 62.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE end of the great 1,000-mile Trial is in sight, and the cars are expected to arrive in London to-day before seven p.m. going from the Marble Arch to the Horse Guards Avenue, by way of Regent Street and Pall Mall. For the speed trial in Welbeck Park, which was arranged by the kindness of the Duke of Portland, fourteen cars entered, eight of which were in the amateur section. This took place yesterday, and proved of considerable interest. Altogether, the affair has been a great success, a triumph for automobilism, and a record in organisation.

Miss Bacon's Latest Adventure.

FATE has been unkind to Miss Bacon, and railway companies and stupid men have been cruel to her motor-bicycle. How she rode forth on the 1,000-Mile Trial has already been told; how she appeared when on the journey is depicted on another page; how her machine was disabled from continuing beyond Bristol is also known. But the latest incident in her career as a motor-bicyclist is perhaps the worst of all, for the other day the driver of a cart backed into the cycle, smashing it, and nearly serving the rider in a similar way. We are afraid she may be laid up for some time as the result of the accident. Seeing that Miss Bacon was getting "quite attached to the motor-bicycle and its little ways"—to use her own expression—she is naturally chagrined as well as hurt. But we are rather inclined to differ from her belief that luck has fled from the venturesome little lady ever since she saw a "black dead cat lying in a ditch!"

Accidents in France.

IN the March issue of the statistical table prepared monthly by *Le Velo* there is included for the first time a summary of the month's railway accidents, so the student of figures can now make direct comparisons between the four great means of locomotion in France. And of the four—the horse, the automobile, the bicycle, and the train—which leads the way in the matter of accidents? Why, of course, our dear old friend the noble steed, and that in no half-hearted manner. To his own book he was the direct cause of no less than 718 accidents during the month of March, while his mechanical rivals only accounted for 170 between them. On glancing through the list of fifty-two deaths occasioned by the horse one remarks at once the great variety of dangers that the owner of a horse runs. He may be bitten or kicked, he may be run over or thrown, his horse may fall on him or bolt with him, and yet, in spite of all, we—motor men included—love our old friend. All that his admirers who motor ask for is that his mechanical competitors receive equality of treatment and be not stigmatised as "nasty, dangerous things," while his misdeeds are carefully glossed over. After the horse the next on

Le Velo's list is the bicycle, the use of which has brought about seventy-five accidents during the month, and in five instances the results have been fatal. Then comes the automobile with fifty-two accidents, accounting for four deaths, the most notable of which was that of the unfortunate Herr Bauer at Nice. This number is considerably in excess of that recorded on previous occasions, and marks the initial stage of that condition of affairs which has since resulted in so rigid an enforcement of the police regulations governing the circulation of self-propelled vehicles. The last on the list is the train, and here one finds but forty-three accidents, although the percentage of fatalities has been considerably higher than in the case of the automobile or the bicycle. The train must be held responsible for thirteen deaths, the victims in each instance being killed instantaneously.

Automobilism and Nature.

IN the near future, says the *Yorkshire Herald*, in an eulogy of the motor-car, Englishmen and Englishwomen will know and love their country better than they have done in the past. The disciples of Ruskin, of Wordsworth, of Keats, and of Shelley, may sigh for the return of the days of the stage-coach, when communication between man and his fellows was difficult. But the world was made for all, and its delights are to-day being tasted by the million, instead of by the hundred. The cycle and the motor-car have arrived just in time to remind the Briton, who is a bird of passage, that he has been following a myth for years, and that the Land of Promise lies immediately under his nose and not over the seas. If the motor-car does nothing more than bind him more closely to his native land it will achieve much.

Newspaper Views.

THE 1,000-mile Trial has caused the general press to devote much more attention to the motor-car than usual, and while there are a few newspapers which are still inclined to treat the modern means of locomotion somewhat sceptically, yet the majority are now regarding them a little more reasonably and rationally. As a case in point we may refer to the *Doncaster Chronicle*, which states that "As yet, motor-cars are in their infancy, but it is a well-developed infancy, and the vehicles thus on view illustrate the highest type of horseless vehicle, the vehicle that is destined to be the popular car of the future. The public have not hitherto been deeply impressed by the specimens which have been occasionally seen, but this display of the finest cars yet constructed will stimulate interest in the development of automobiles, and tend to remove many prejudices that had, perhaps unwarrantably, been formed."

"A Foolish Orgy."

The motor-car rush or scramble of a thousand miles round the country strikes me, says a writer in *Society*, "as one of the most foolish orgies in the way of travelling that our island of eccentrics has yet witnessed. The promoters of the business seems to be inordinately anxious to prove that the motor-car

can do a journey without blowing up or coming to pieces. Well, seeing that motorism is the inevitable mode of travel, and, perhaps, of transport, in the not distant future, all this anxiety to show that the cars are not altogether gaseous frauds is a trifle absurd. We none of us need convincing of the merits of motorism, but our ancient conservatism, and perhaps our natural love of horseflesh, restrains us from committing ourselves to 'horseless traction.' We admit the principle, but, with your leave, we would defer acting upon it." We give this as an extreme instance of the journalistic way of making bricks without straw. The contributor to our contemporary wanted to say something about the 1,000-miles Trial, and, in absence of knowledge, imagined the strange notion set forth in the paragraph quoted. And of such is *Society*.

The Prejudice of Innovation.

RECOGNISING that the Trial is "not altogether an excursion for the sake of pleasure, but is intended more as an educating and proselytising mission," the *Country Gentleman* doubts whether it will hasten the development of the industry, as "the sentiment of the nation, on the whole, is still opposed to this innovation in methods of travelling." That, of course, only records an obvious truth. All innovations find opposition in the early stages of development, and that the motor-car has not escaped such a circumstance is matter for congratulation, since, when its value does become recognised, it will hold as strong a claim on the public as those methods with which it is now so familiar.

A 7-H.P. Racing Motor-Tricycle.

WE are now able to illustrate the racing tricycles used by Mr. C. Jarrott and Mr. F. F. Wellington at the race meeting at the Crystal Palace on Easter Monday when, it will be remembered the former succeeded in creating a new British record for the hour, covering no less than 38 miles 868 yards in that time. The machines are fitted with two $3\frac{1}{2}$ -h.p. motors of

the Aster type, and Longuemare carburettors. The motors, as will be seen, are placed inside the frame, giving, it is claimed, great advantage for speed. One of the machines was built by the Phebus Company, and the other by the Gladiator Company. Mr. Wellington, who is the sole agent for both machines in this country, tells us that on Good Friday they covered the mile in 1 min. 27 sec., and that as soon as the weather gets finer, with less wind, he expects that the above-mentioned records will quickly be broken.

Motor-Cars in the Russian Army.

ATTENTION has been already drawn in these columns to the active interest which is being shown in motor-cars by the military authorities of Germany, France, and Italy. To these countries, Russia must now be added, for the *Horseless Age* reports that the American Consul-General Holloway, at St. Petersburg, has written to the U.S. State Department, stating that the Russian Minister of War is desirous of purchasing a freight automobile, to be propelled by either steam or kerosene, and proposes that if any manufacturer will ship two such carriages, one for steam and the other for kerosene, to St. Petersburg, the War Department will pay the freight and duty on both, purchase the one better suited for its purpose, and return the other. The machines are to be in St. Petersburg by June next. Manufacturers are asked to send catalogues, giving weight, inside dimensions, price, rapidity of movement and other data to Colonel N. A. Blinoff, chief of staff, Ministry of War, St. Petersburg, Russia. Mr. Holloway suggests that the possibility for large orders to supply the Russian army, which is scattered over an area more than twice the size of the United States, with automobile wagons is worthy of attention.

A Reminiscence.

THE tour of the Automobile Club, in connection with which an exhibition was held in Newcastle on Saturday, calls to mind the fact that in the infancy of the motor-car movement no one, says the *Newcastle Journal*, took a deeper interest in it than the late Mr. John Philipson. Some years ago, as president of the Institute of Carriage Manufacturers, he delivered an address, which was mainly devoted to the coming of the automobile, and many of his predictions on that occasion have already been verified. He used to value very highly a collection of valuable old drawings of steam carriages, and his sons sent some of these to the exhibition to show that steam carriages were actually made more than half a century ago. Mr. Rowland Barnett also contributed a collection of drawings, illustrating the electrical side of the question.

Routes and Roads.

MR. T. A. EDGE has compiled and Messrs. Walter Scott, Ltd., have published the "Clincher" guide of the cycling routes of England and Wales which will be of value to motorists as well as to cyclists. This gives reliable information concerning the undulation and surface of the various roads, a code of letters being adopted to minimise the space occupied by such descriptions. The book, which is of convenient size, has a specially drawn map in which the roads are depicted in black and white. Each road is numbered to correspond with the route set forth in the book so that the rider can form his choice of route from any given point to another, and get out an itinerary of his suggested journey without difficulty.

Educating Horses.

DURING a recent short run of fifty miles in Ireland, the Dublin manager of the Cycle and Motor Company, Ltd., had to pull up at the roadside no fewer than ten times to allow spirited horses to go by. Such an experience has suggested to him the advisability of a thorough education of Irish horses, and he announces his willingness to send a motor-quadracycle to the address of any persons in the Irish capital who have restless horses, so that the animals may become accustomed to their mechanical rival. Hardly a week now passes without news of some such offer on the part of automobilists to educate horses.

THE *New York Journal* has purchased six electric vans for delivering papers. The *Journal* intends to add more motor-cars as needed, as the experiment so far has been a decided success.

The Automobile Club's 1,000-Mile Trial.

ON THE LONG PILGRIMAGE.

By OBSERVER.

EDINBURGH, Thursday, May 3rd.

The official record of the hill climbing on Birkhill yesterday has been issued as follows:—

		Miles per hour.	Number of persons on car.
A 17	Hon. C. S. Rolls's 12 h.p. Panhard	16.0	Two
3	3½ h.p. Ariel quadricycle	13.3	One
4	Ariel tricycle and Whippet trailer	12.6	Two (both had to dismount)

NEWCASTLE, Friday, May 4th.

It was not a very grand morning for our 122 miles run to the Tyne. The sky above Edinburgh was shedding teardrops as we left, and the roads were greasy and treacherous. As Arthur's Seat faded in the distance the weather cleared and the sun came out, revealing a beauty of landscape that must have delighted every passenger. Every town and village showed an interest in our progress. Portobello contributed its throng of fisher-folk and seaside residents; Musselburgh was awake to the interest of the occasion; and all the population of Tranent and Gladsmuir turned out in welcome. And right hearty the welcome was, everywhere. The elder people saluted pleasantly, even the stolid fisherman, taking the "cutty" pipe from his mouth to wave it in token of his goodwill. As for the children, they went fairly wild with joy, cheering with a shrill treble that was the true keynote of delight. It was a veritable triumphal procession. But nobody had broken bread that morning; the rushing through the sea-scented air was appetising; and a halt at Haddington gave an opportunity to a hundred hungry people to fortify themselves against the hours to come.

LORD KINGSBURGH AND COL. MAGRATH ON DAIMLER CAR.

As we entered the Haddington burgh control a strong breeze was blowing, slightly favouring the motorists, and the weather was fine, the roads being free from dust. Breakfast having been taken the journey was resumed. At Haddington the motor-cars had got some distance into rural districts, but on setting out for Dunbar the sea coast soon came into view once more. It was kept in sight until after passing Cockburnspath, where the road again diverged in the direction of Grant's House, Houndwood, and Ayton, till Burnmouth was reached, when the German Ocean was once more sighted until Berwick was reached. The road

gradually improved through Dunbar and Cockburnspath, where a hill with a nasty triple turn had to be negotiated, with plenty of grease at the corners. The countryside was now so sparsely populated that speedy travelling was both comfortable and safe, and good time was made to Berwick, 58 miles from the start.

Luncheon having been partaken of, a start was made for Newcastle, and the run was quite uneventful. Among the minor troubles was the snapping of a driving chain on Mr. Edmund's car, which rather delayed his progress. Most of the people were ready for tea in Morpeth, and after that there was a clear run into Newcastle, which most of the cars reached well within the scheduled time.

LEEDS, Monday Night.

After a rest we were off again in good time this morning. Certainly the outlook was not promising. There was a general dullness, and hardly were we in the street when the rain—a hard and biting rain—commenced. Not only were the elements above unkindly, but roads were bad, an uncomfortable thought in connection with the length of the run and the long stay to be made in York.

Still, there is nothing but to start, and to try, when the Automobile Club goes on tour and fifty-one automobiles set forth, to achieve the distinction of success. But the climatic conditions were not the only drawback. One of the burners of my car soon gave trouble, and we had to draw aside—waiting in a heavy downpour of rain till deliverance came. The stoppage gave us opportunity for observing the mishaps of other people. Between Newcastle and Durham the roads were heavy, very heavy. Mr. Siddeley discovered that when he experienced a side slip on the greasy tram lines and his car was turned completely round. Immediately to the rear was the Century tandem, which ran into the pavement and struck one of the wheels of the Daimler Parisian. The former got the worst of the encounter, its wheel being buckled.

Through Chester-le-Street we went, and on to Durham, accompanied by a very substantial downpour of rain, which made the roads thick and sticky with mud. There was no dust now; and the respective disadvantages of rain and dust compared may form a topic for discussion at some later date. Breakfast was indulged in at Durham, a city of proud eminence, with a lovely old cathedral, whose glories would have been appreciated had the weather been otherwise. As it was, the glorious pile was enveloped in a thick mist, and breakfast was the only thing that really interested us in Durham. The streets of the city are narrow and tortuous with many difficult rises, and were in a very greasy condition.

A fresh start being made, we came upon some very short and steep inclines. These came upon us with almost startling suddenness, causing us to drop from fourth to first speed straight away. On Ferry Hill, the Daimler of the Hon. J. Scott Montagu, which has done splendidly, required a little coaxing—it, too, regarding the state of the roads as abnormally heavy, even for its fine constitution and good running powers. Leaving Wycliffe the roads showed a slight improvement on towards Darlington, where it appeared that all the population had turned out to greet us. The only passage for the cars was in the centre of the single greasy lines of tramways, and that no accidents took place was a tribute to the skill of the drivers and the reliability of the cars, which should appeal to all who saw the way the vehicles were handled. In Darlington there are some awkward corners, that at Blackwellgate being probably the worst. In turning the corner near the Fleece Hotel, Mrs. Bazalgette met a horse and conveyance just ahead. She slowed, and did her best to clear, but failed, and jostled a lamp-post. Several standing by at once came to the rescue, and giving a turn to the head of the little car sent it on its way again.

The weather had up to Durham been somewhat of a "Scotch mist," but by the time Darlington was reached matters had improved; while on to Northallerton, where a halt was made for lunch, the going was excellent, and the sun glanced out for a second or so at pretty long intervals. In the Thirsk and Northallerton district the scenery was very enjoyable, and, indeed, the same may be said of the journey right into York.

There was little excitement on the way, and my car was pulling grandly until within three miles of Northallerton.

Then trouble with our burners began again, and within a mile it was necessary to get down eight times to attend to them. The driver of one of two cars that were close together, and each trying to get to the control first, failed to apply his brake on a greasy road and skidded, travelling up a bank. Fortunately no damage was done to man or machine.

Luncheon was taken at Northallerton, and that meal being over, the rain ceased, but unfortunately the weather continued dull and threatening, and there was too much mud on the road to be pleasant. Mr. E. J. Hutton, J.P., whose misfortunes with his four-cylindered Panhard car are well-known, was at Northallerton with his new Creanche electric car. After the halt there was more greasy running as far as Thirsk. For company for some miles we had the Lanchester car, No. 28. On the level we were easily faster, but up hill the Lanchester car was two or three miles ahead, and the consequence was we were passed and repassed nearly the whole of the way, as the road was hilly. The Wolseley car was frequently in our company during the next stages of the journey, but suffered from innumerable punctures, as have several other cars with pneumatic tires. Mr. Johnson, too, has had rather a bad experience, puncturing several times.

Driving through Thirsk was no careless matter, as the market square was about as closely packed with people as any passed through during the whole course of the tour, a fact due to the hiring fair in progress, and not wholly associated with the coming of the cars. We met some very antiquated-looking vehicles drawn by horses going to the hiring fair, where merry-go-rounds seemed the leading feature—so far as our rapid observation revealed. The road improved slightly through Easingwold and Skipton, and at length we arrived at York, where each vehicle was detained an hour and a half in the grounds of the Railway Hotel for the purposes of exhibition. The cars were released in the order of their arrival, and there were about twenty of them in the grounds at one time. Great crowds had gathered in the picturesque old city, and the advent of the cars created much commotion. There was quite a fashionable gathering at the exhibition, and the whole proceedings were of the nature of a picnic. Many of us would have preferred to have stayed in York, but the programme had to be obeyed.

When York was left behind dry roads were entered upon for the first time, though the surface quality was otherwise none too satisfactory, especially after Tadcaster had been passed. The Napier car had punctured badly outside Northallerton, and was overhauled by Mr. Holder's Daimler, but the latter had to change a burner outside York, and entered Leeds only just in front of its friendly rival.

SHEFFIELD, Wednesday Night.

All last night a hurricane was blowing at Leeds, and the enthusiastic motorists left their different hotels fully prepared for a dirty day. From a few minutes after five o'clock they journeyed forth from warm rooms and cosy quarters prepared to undergo fatigue and sacrifice themselves in storm and rain in order to convince the British public of the delights of automobilism. Some may have wavered; a few have quailed before the elements; but none confessed to such weakness. "Was there a man dismayed?" If there was, he certainly cloaked his feelings as well as his person. We were a motley assembly as in oilskins and leathern jackets we took our seats. Unlike the foolish virgins who had not seen to their lamps, we were prepared for anything, and if the burners did give trouble it was not the fault of the motorist.

Fortunate were those who had made themselves waterproof, and who were also impervious to wind, for we had a cool experience, and those on the car that was last at the control spending an hour while others were setting forth must have reflected on the disadvantages of rear positions.

The day's run has been one of only seventy-four miles, but seeing that we have also had two exhibitions, a succession of steep hills, and somewhat greasy roads, it has been harder work than some of the longer runs indulged in in the early days of the Trial. In fact, I suppose we have not had a mile of level road during the whole of the day. Forty-nine cars left the drill hall in Fenton Street, the early hour and the unfavourable weather prevailing causing the departure to take place under quieter con-

ditions than the arrival. Persons who were astir, however, had an opportunity of seeing the vehicles in a more attractive state than on their entry into the city from Newcastle. Passing through Harewood and Pannal we found the roads very muddy, while the wind was exceptionally biting. These two conditions, combined with rain, proved depressing.

But that was not the only trouble, for I abandoned my car about a mile and a half before reaching Otley. It happened thus. Our control card was signed 7.39 a.m. at Leeds, and at 10.15 we were still three miles from Harrogate. We had gone scarcely half a mile from the Leeds outward control when the

MISS BACON AND HER WERNER MOTOR-BICYCLE.

Photo by

[Lord Kingsburgh.]

burners gave trouble—an experience realised by other cars as well—although none seemed in such great difficulties. At frequent intervals we were in trouble, and after passing Pannal were met by several of the cars returning from Harrogate to Pannal, where they again got on the high road to Bradford. We turned with them, and so missed the holiday town and breakfast. Then the car picked up and went grandly, and we got ahead of several vehicles, including a Peugeot, when, alas, the burners again went wrong, and those that we had passed now passed us, smiling. Off came the bonnet of my car, and we discovered that there was a little spray of water putting the burners out. Closer examination revealed a loose stud, and it was clear that some little time would be required for repairs. I was glad to accept the offer of a seat on Mr. Hargreaves' second twin Daimler, driven by Mr. Meyer, and to continue the journey—looking forward to having the first meal of the day at our next stopping place, Bradford.

Up to this point the wind had been in our faces, and in some of the exposed situations driving the cars had been a difficult matter; from Harrogate to Bradford the wind was more helpful and the running decidedly better. With the improving weather one could think of surroundings and enjoy the pleasant scenery between Harrogate and Otley.

A great deal of interest was manifested in Shipley and Bradford in the visit of the cars. The Bradford "control" commenced at the Charlestown railway bridge at Shipley, and between this point and the "outward control" at Tong the speed was limited to eight miles per hour. Shipley Market Place was crowded with people, and the road into Bradford was lined with spectators. Here in the Town Hall Square the Chief Constable had given permission for a three-hours exhibition, and he had also made splendid arrangements for keeping the great crowd in check. Messrs. J. E. Tuke and C. Grahame White had made excellent local arrangements, and after leaving the town we were glad to find better roads.

Although the way out of Bradford is none too good a road, and proved a fairly stiff climb, none of the cars seemed to be distressed, and a good run during the ten miles which separate the woollen town from Wakefield was enjoyed. We got more jolting in the short run through Wakefield than anywhere else between Bradford and our destination—a fact which impressed us even more than the cathedral. Then on to Sandal Magna we went into Barnsley, where a hurried tea was partaken of. Then again the cars went on—every one of them doing well—through several villages at a good pace to Chapeltown Hill, six miles from Barnsley. This was a dangerous descent, but was taken without mishap, and a short run over a switchback course brought us to Sheffield—rather more than two hundred miles from town.

EN ROUTE.

EDINBURGH.

Last week I sent particulars of how the cars came into Edinburgh. During their stay they attracted considerable attention, and a large number of gentlemen from various parts of Scotland interested in automobilism came into the city to see the vehicles. Several privately owned cars were also present, and on the road between here and Carlisle, Mr. Drummond, of Stirling, Mr. Pullar, of the Bridge of Allan, and Mr. Love, of Kirkealdy, were to be seen on their cars. A rumour somehow got about as to the likelihood of prosecutions for furious driving against some of the owners of cars in the competition, but this was discredited by Superintendent Wright of the County Police. Interim-Chief Constable Chisholm had no complaint regarding the speed of the cars within the city. Only one driver had to be held up. In the opinion of a policeman he was going rather fast, but immediately upon the constable holding up his hand he slackened his pace.

SNAPSHOTTING THE 8 H.P. NAPIER CAR.—A SNAPPER SNAPSHOTTED.

Photo by

[Lord Kingsburgh.]

Fifty-two cars left the Waverley Market on Friday morning, and although the weather was somewhat unpropitious, being showery, with a strong wind blowing, a good many people had gathered at the Market entrance to see the travellers off. An hour or so before the cars started, the Market presented a somewhat animated and unusual scene. The car drivers and assistants were busy getting their machines ready, filling the oil-tanks and inflating the tires, while the passengers were all excitement getting their belongings properly packed into the vehicles and other

preliminaries attended to. There was no set order for the cars going away, each being allowed to start whenever ready immediately after seven o'clock, but thirty seconds had to elapse before the departure of each car. In a very short time the vehicles had all cleared off, and soon were out of sight on their way by Portobello and Musselburgh to Haddington.

Overnight the weather promised anything but an enjoyable trip to those who had arranged to travel to Newcastle. A strong, squally wind, with violent showers, set in from the west. It prevailed intermittently through the night, and when at about half-past six in the morning those who were bound for Newcastle presented themselves at the Waverley Market, they found that the skies were still gloomy, and that the rain was again beating down pitilessly. But a welcome change occurred ere the market was quitted. The journey was blessed with little sunshine. It was, on the other hand, afflicted with a fierce head wind, and, in spite of the hopes engendered by the early showers, by sadly too much dust. The outward "control" of the Edinburgh district was at Levenhall, some six or seven miles from the point of starting, and was under the charge of Mr. W. L. Sleigh, of the Scottish Automobile Club, Mr. J. Alexander, of the C.T.C., and Mr. W. Whitson. Fifty minutes was the time which had to be taken for the distance, those cars which arrived in less than that period after leaving Edinburgh having to wait until it had expired. Mr. S. F. Edge, on his Napier, was first free of the control at 7.50, the others following in close order until forty-seven participating cars and cycles had passed through, besides several who were accompanying the tourists for greater or lesser distances. Fortunately, at the further end of the control there had been much less rain than in the immediate vicinity of the city, and the roads from Levenhall were quite dry, though the high wind, raising as it did clouds of dust, somewhat tempered the blessing of the dry going.

BERWICK-ON-TWEED.

The arrival of the cars in Berwick created considerable interest, and their advent to the town was keenly awaited by a large number of persons. It was scarcely anticipated, however, that the vanguard of the motorists would reach Berwick at the early hour they did. The Hon. C. S. Rolls' car was the first arrival. A couple of minutes later two more arrived, and they belonged to private owners. They were Mr. J. A. Holder's 12-h.p. Daimler and Mr. C. E. Kennard's 8-h.p. Napier. As three-quarters of an hour was allowed at Berwick for luncheon plenty of opportunity was given the many interested spectators to examine the cars. After a short interval the motors began to arrive in more regular order, and continued to do so until after two o'clock. At the dinner hour there was a very large gathering of people in High Street. Although some inquired into the working parts of the motors, the majority were content to witness their arrival and departure, and many expressions of satisfaction were heard at the easy way in which they were turned or drawn up. The Head Constable (Mr. Nicholson) and several of his force ably kept the course where the crowd was thickest, and directed the motorists, while the work of timekeeping was most efficiently performed at the red flag control by Messrs. S. Oliphant and T. W. Boal; and at the white flag control by Messrs. W. M. Mather and W. Allan Caverhill. The inward control was near the cemetery gates on the North Road, and the outward control beyond the Tweed Saw Mills, a distance of one and a half miles. With the exception of a motor-tricycle and one car, all got safely away, the two exceptions having slight breakdowns, which necessitated their remaining for some time for repairs.

NEWCASTLE-ON-TYNE.

The official records concerning the run from Edinburgh to Newcastle (122 miles), which took place on Friday—the roads being good but the vehicles having a strong head wind to contend with—show that all the cars enumerated below completed the journey at a speed up to the legal limit of twelve miles an hour, viz:—

In the manufacturerers and agents' section:—

No. 2, Benz "Ideal."

No. 3, "Ariel" quadricycle.

- No. 4, "Ariel" tricycle, with Whippet trailer.
- No. 9, Motor Manufacturing Company's "Iveagh" phaeton.
- No. 12, Motor Manufacturing Company's tricycle.
- No. 15, De Dion voiturette.
- No. 16, Motor Power Company's "Gladiator" voiturette.
- No. 22, Lanchester Engine Company's 8-h.p. car.
- No. 26, Friswell's 8-h.p. Peugeot.
- No. 31, Motor-Car Company's 3½-h.p. "Triumph."
- No. 34, Motor-Car Company's 3½-h.p. Decauville.
- No. 35, The Daimler Company's 6-h.p. carriage.
- No. 39, "Century" Tandem Tricycle.
- No. 40, Wolseley Company's voiturette.
- No. 44, International Company's 3-h.p. victoria.
- Nos. 46 and 47, Automobile Manufacturing Company's 7-h.p.

Richard.

No. 51, Star Motor Company's voiturette.

- No. A 31, Mr. W. Exe's 6-h.p. Parisian Daimler.

DARLINGTON.

The unusual sight of a string of motor-cars passing through Darlington caused quite a flutter and thrill of excitement in almost everybody's mind. The ordinary spectator had been led to believe that at 10.30 prompt, with a blowing of horns, the whole of the cars would perform a triumphal march through the town, and that the traffic would be suspended in certain streets for their benefit. Earlier than that hour the footpaths in Northgate, Prebend Row, and Blackwellgate were lined with people who had the pleasure of seeing a car in every fifteen minutes pass along. At about 11 a.m. a string of cars and tricycles came through mud-besmeared, and owing to the wretched weather presenting altogether a sad spectacle. None of the cars stopped at Darlington, but passed through smartly on their way to Northallerton, where luncheon was awaiting for them. By noon forty-five cars had passed through Darlington. The tricycles caused a lot of amusement by the manner in which they buzzed through the town at full speed, and yet threaded their way carefully amid the traffic in the centre of the town. The control for Darlington began at St. Paul's Church, and ended at Parkgate, George Road, and at that point they went straight ahead at will. Mr. J. W. Morley acted as timekeeper at Darlington, and the police attended to the traffic in a masterly manner.

YORK.

There was a great crowd to welcome the vehicles and their passengers, and considerable interest was taken in the exhibition. Two hours' halt was made while tea was taken, and judging from the fashionable assembly in the hotel grounds, many of the leading county families were represented.

LEEDS.

A real Yorkshire welcome was accorded the cars and their riders as they came into Leeds, the Hon. C. S. Rolls leading. Those who have followed the reports of the Trial have seen how he has occupied a good position right through the contest, and the Leeds people were naturally interested in the personality of the famous *chauffeur*. He got in a few minutes before time. The Ariel tricycle with Whippet detachable trailer was a quarter of an hour behind, and then came a Daimler 12-h.p. motor car and an 8-h.p. Napier, closely followed by the usual leading cars. For more than four hours after the first had made its appearance the cars kept arriving at short and long intervals, the last to turn up being a 7-h.p. Richard car. The fact that there was not a regular continuous stream of them robbed the scene of some interest, but it was apparently none the less attractive to the bystanders.

The great majority of the cars, it was stated, had accomplished the twelve-miles-an-hour average in the course of the day.

The official records concerning the run from Newcastle to Leeds show that the following vehicles completed the journey up to a speed of twelve miles an hour. We have not followed the division into amateur and manufacturers' sections in order that the cars could be arranged in the order of their running time:—

- A 17 Hon. C. S. Rolls's 12 h.p. Panhard
- 4 Ariel tricycle and Whippet trailer
- 31 M. C. C. Triumph

- A 29 Mr. M. Mayhew's 7 h.p. Peugeot
- A 11 Hon. J. Scott Montagu's 12 h.p. Daimler
- 3 Ariel quadricycle
- A 30 Mr. J. D. Siddeley's 5 h.p. Parisian Daimler
- 8 Motor Manufacturing Company's 6 h.p. phaeton
- A 24 Mr. R. E. Phillip's Mors Petit Duc
- 9 Motor Manufacturing Company's 6 h.p. Iveagh phaeton
- 16 Gladiator voiturette
- 34 Decauville car
- 15 De Dion voiturette
- 36 6 h.p. Daimler

THE CARS ARRIVING AT KENDAL.

- A 22 Mr. J. A. Holder's 12 h.p. Daimler
- A 10 Mr. E. Kennard's 8 h.p. Napier
- A 4 Mr. M. Mayhew's 8 h.p. Panhard
- 26 Friswell's 8 h.p. Peugeot
- A 20 Mr. Ashby's Empress tricycle
- A 3 Mr. T. B. Browne's 6 h.p. Panhard
- 47 Richard car
- 35 6 h.p. Daimler

- 14 De Dion voiturette
- 22 Lanchester car
- A 21 Mr. E. Pitman's 6 h.p. Daimler
- A 7 Mr. A. Harmsworth's Parisian Daimler
- A 2 Mr. F. H. Butler's 6 h.p. Panhard
- 2 Benz Ideal, 1900 pattern
- A 23 Mr. C. Cordingley's 6½ h.p. M.M.C. phaeton
- A 26 Mr. C. K. Gregson's 6 h.p. Daimler

- 1 Hewetson's Benz Ideal
- 51 Star voiturette
- 39 Century tandem
- 40 Wolseley voiturette
- 37 6 h.p. Parisian Daimler
- 5 Locomobile steam car

Below is the list of the remaining cars which completed the journey. The average speed is given, and the order of arrangement is that of the running times of the cars:—

		Miles
A 12	Mr. Edmund's 6 h.p. Daimler	11½
27	New Orleans car	11
49	Marshall car	11½
A 28	Mr. E. M. Iliffe's Enfield quad	11
32	M.C.C. Triumph	11
41	International Victoria	11
38	Daimler char-a-banc	11
44	International Victoria	11
12	Motor Manufacturing Company's tricycle	10½
46	Richard car	10
A 31	Mr. Exe's Parisian Daimler	9½
24	Marshall car	9
A 25	Mrs. Bazalgette's Benz car	8½

BARNESLEY.

It had been understood in the town that the automobiles would reach Barnesley between 4 to 4.30 o'clock, and arrangements were made for them to stay a few minutes at the Kendray Market, where the people taking part would be welcomed by the Mayor (Alderman Wilkinson). Chief Constable Butler had arranged for the regulation of the traffic, but some of the cars stopped, some did not, and the arrangements unfortunately came to nothing, no demonstration of any kind being made.

SHEFFIELD.

Although the earlier cars into Sheffield did not encounter crowds of people the streets were well lined with spectators between five and six o'clock, and many lingered at the corner of Firth Park Road till well after seven o'clock, by which time more than forty cars had arrived; but the enthusiasm which had been anticipated was wanting. The following formed the Sheffield control timekeepers:—Messrs. W. C. Cope, T. Lonsdale, M. E. Cope, F. B. Cawood, T. Sinsdale, C. Pearson, Turton Chatterton, W. A. Lister, H. White, and G. H. Wilson. The timekeepers at the Drill Hall were Messrs. F. B. Cawood and C. Pearson. The order of their coming was as follows:—

- A 17 Hon. C. S. Roll's 12 h.p. Panhard
- 4 Ariel tricycle with Whippet trailer, 2½ h.p.
- A 10 Mr. E. Kennard's 8 h.p. Napier
- A 22 Mr. J. A. Holder's 12 h.p. Daimler
- A 20 Mr. H. Ashby's Empress motor cycle, 2½ h.p.
- A 4 Mr. M. Mayhew's 8 h.p. Panhard
- A 30 Mr. J. D. Siddeley's 6 h.p. Parisian Daimler
- A 19 Mr. J. R. Hargreave's 12 h.p. Daimler
- 34 Decauville car, 3½ h.p.
- 26 Peugeot, 8 h.p.
- 35 Daimler car, 6 h.p.
- A 11 Hon. John Scott Montagu's 12 h.p. Daimler
- 16 Gladiator voiturette, 3½ h.p.
- 3 Ariel quadricycle, 3½ h.p.
- 37 Daimler Parisian, 6 h.p.
- 15 De Dion voiturette, 3 h.p.
- 40 Wolseley voiturette, 3 h.p.
- 36 Daimler car, 6 h.p.
- A 29 Mr. Mark Mayhew's 7 h.p. Peugeot
- 47 Richard car, 7 h.p.
- A 3 Mr. T. B. Browne's 6 h.p. Panhard
- A 27 Mr. J. R. Hargreave's 12 h.p. Daimler
- A 21 Mr. E. Pitman's 6 h.p. Daimler
- A 31 Mr. W. Exe's Parisian Daimler, 6 h.p.
- 9 Motor Manufacturing Company's 6 h.p. Iveagh phaeton
- 1 Benz Ideal, Hewetson's 3 h.p.
- 51 Star voiturette, 3½ h.p.
- A 7 Mr. A. Harmsworth's 6 h.p. Parisian Daimler
- 14 De Dion voiturette, 3 h.p.
- A 28 Mr. E. M. Iliffe's 2½ h.p. Enfield quadricycle
- 2 Benz Ideal, 3 h.p.
- 31 M.C.C. Triumph, 3½ h.p.
- 12 Motor Manufacturing Company's 2½ h.p. tricycle
- A 2 Mr. F. H. Butler's 6 h.p. Panhard
- A 24 Mr. R. E. Phillips' 4 h.p. Mors Petit Duc
- 44 International victoria, 3 h.p.
- A 26 Mr. C. K. Gregson's 6 h.p. Daimler phaeton
- 8 Motor Manufacturing Company's 6 h.p. phaeton
- A 12 Mr. H. Edmund's 6 h.p. Daimler
- 46 Richard car, 7 h.p.

- 27 New Orleans car, 3 h.p.
- 33 Decauville, 3½ h.p.
- A 25 Mrs. Bazalgette's Benz Ideal, 3 h.p.
- 39 Century Tandem tricycle, 2½ h.p.
- 41 International victoria, 3 h.p.
- 32 M.C.C. Triumph, 3½ h.p.
- 38 Daimler public service vehicle, 9½ h.p.
- 28 New Orleans car, 3 h.p.

The Daimler luggage van arrived a few minutes after the first Decauville car, being succeeded a few minutes later by Mrs. Kennard on her De Dion voiturette. The Lanchester car arrived at 5.30 a.m. on Thursday, having had a long stoppage on the way. On Wednesday evening and all day on Thursday the cars were on exhibition, and yesterday morning they left for Nottingham, the marshals being the Executive Committee, consisting of Messrs. E. P. Reynolds, C. D. Leng, W. St. Q. Leng, H. M. Pashley, E. Frost, E. Hill, and J. T. Thompson (hon. sec.).

EXHIBITIONS.

A General View.

SEVERAL important exhibitions have been held this week, and the appearance of the cars as they stood in the hotel grounds at York, or the market square at Bradford, must have impressed thousands of people. One versatile journalist has suggested that the inscription "These are they which came out of great tribulation" should have been placed over the halls at Edinburgh, Newcastle, Leeds, and Sheffield, in which the cars have been assembled together, and certainly the latter stages of the journey seem to have made the notion not inappropriate. The local war funds must have benefited to a very material extent, and even at Bradford, where the cars were on exhibition in the street for three hours, a street collection was made among the onlookers in aid of the Mayor's War Relief Fund. Over £100 was taken at Edinburgh, and the exhibition at Newcastle was equally successful from a financial point of view.

Edinburgh.

THE exhibition of motor-cars in the Waverley Market Hall, Edinburgh, was formally opened by Lord Kingsburgh in the presence of a goodly company of spectators, who before the opening time had an opportunity of inspecting the vehicles, and of expressing surprise at and appreciation of the variety and construction of the motors. The audience included a number of Edinburgh Town Councillors and others. Lord Provost Mitchell Thomson, at the outset, welcomed the motor-carists to Edinburgh, and predicted that in a few years they would see motor-cars running very frequently on country roads. He could not say that he liked them very much in cities, more especially when they ran too quickly; that was a thing that they, representing the people of Edinburgh, rather objected to. It said a great deal for the cars that they had reached the turning-point of their journey without any serious accident, and he complimented them, especially upon their hill-climbing records. With regard to the question of safety, he remarked that the driver of a motor-car had his machine under much greater control than the man driving horses. The Hon. J. Scott Montagu, M.P., and M. Bordin, a member of the Automobile Club of France, returned thanks for the Lord Provost's welcome. Lord Kingsburgh, in declaring the exhibition open, gave his opinion, as an unbiassed spectator, of the trial run. He had been himself surprised, he said, to see the extraordinary power the cars had of climbing hills, in some cases the gradients being something like one in eight, and in others, for short distances, one in seven. Some of them, he also mentioned, mounted Shap Fell and Dunmail Rise at something like seventeen miles an hour. Speed was a very difficult question to enter upon. One thing he asked them to consider was whether it was not true that the question of speed and safety did not depend so much upon a named speed for all roads as on the capacity of the vehicle to be easily steered and to be easily stopped. One of the vehicles going

twelve or fourteen miles an hour could be pulled up absolutely in its own length. That was an element of safety which they knew very well was not attainable with horses. Having spoken of the cordial welcome received from all classes on the route, particularly from the older generation, his Lordship said they had reason to congratulate themselves on escape from accident, and he could almost prophesy that in the return journey there would be no serious accident that could be attributed in any way to the motor-car. Automobilmism was not only a sport, but a means of locomotion very much wanted in the country. He was quite sure that as soon as County Council authorities knew the capabilities of motor-cars they would have an alteration in the road regulations. Treasurer Cranston proposed a vote of thanks to Lord Kingsburgh, who in turn moved a vote of thanks to the Lord Provost for his presence. In the course of the Thursday the show was visited by large numbers of people, and the greatest interest appeared to be manifested in the different exhibits. During the evening the attendance was fully 5,000. Attractive music was provided by the brass and pipe bands of the Gordon Highlanders, and Mr. E. J. Coles gave a display of expert driving.

INSPECTING THE MARSHALL CAR.

Newcastle.

THE motor-vehicles were on exhibition on Saturday in the Cambridge Hall, Newcastle. There was an influential gathering at the opening ceremony, over which Admiral Cleveland, director of Palmer's Shipbuilding Company, presided. The Mayor (Mr. Riley Lord), who attended to open the exhibition, was accompanied by the Mayoress (Mrs. Albert Lord), and amongst others present were the Hon. John Scott Montagu, M.P., Mr. Mark Mayhew, L.C.C., Colonel Palmer, Captain Chapman, Alderman Sutton, Alderman Sanderson, Alderman Winter, Councillors Thomas Cairns, Dr. Mason, John Beattie, R. Flowers, Wardhill, Ross, Kenshaw, Mr. J. R. Roberts, Mr. Richd. Welford; Mr. C. Johnson (secretary of the Automobile Club), Mr. William Philipson, and Mr. Rowland Barnett, hon. secretary of the local committee; Mr. Young, and many others. Letters of apology and regret for non-attendance were received from Earl Grey, Sir Benjamin Brown, Mr. Watson Askew-Robertson, and others. The Mayor, in opening the exhibition, said he was very glad to welcome the Automobile Club to this great engineering centre—probably the greatest engineering centre in the world. He reminded his audience that this was the birthplace of George Stephenson, and the locomotive, and added that railway engines were still built in Newcastle. It was the characteristic of Englishmen to peg away till they were successful, and he hoped the British manufacturers of motor cars would not be behind those of America and the Continent. The object of the Automobile Club, as he understood it, was to show what had been accomplished up to the present time and to encourage the use and develop the manufacture of these cars. He was glad to see that they laid down

stringent instructions to abide by the regulations of the local authorities over whose roads they might pass on their tour. In conclusion, he hoped the members would be interested in their visit to Newcastle. This, he remarked, was one of the oldest towns in England, but, old as it was, he assured them it did not feel in any way aged, for the spirit of enterprise and progress was just as keen as amongst its younger rivals. He had very great pleasure in declaring the exhibition open, and wishing it every success.

The Hon. John Scott-Montagu, M.P., on behalf of the Automobile Club, returned thanks for the cordiality of the reception accorded to it in Newcastle. Throughout the tour, he said, the Club had been welcomed with open arms everywhere, and there had been a remarkable cordiality displayed in the various villages through which they passed. In the neighbourhood of George Stephenson's birthplace, he felt sure a more than usually intelligent interest would be excited in the motor-vehicles. The object of the club was to demonstrate that the manufacture of these cars had reached a stage when they might be considered thoroughly safe, reliable, and trustworthy in the varying conditions of road, wind, and weather, and that object, he thought,

THE LOCOMOBILE CAR EN ROUTE.

was being achieved in the present tour. Mr. Mark Mayhew moved a vote of thanks to Admiral Cleveland for presiding. He said the success of the present tour heralded the dawn of a new day for the motor-car industry. Admiral Cleveland, in reply, said the thanks of the club were rather due to the two local hon. secretaries, Messrs. Philipson and Barnett, and to Mr. Johnson, the secretary of the Automobile Club. There could, he said, be no doubt that the result of this 1,000-mile Trial was proving a great triumph for the motor-car. He was particularly struck, on watching the entrance of the cars into the hall on Friday night, to notice the skilful way in which they were manoeuvred. The term "handy man" which had lately been applied to the blue-jackets was, he thought, one which the drivers of the cars had thoroughly earned. Afterwards the Mayor and Mayoress proceeded on a tour of inspection of the vehicles. The proceeds of the exhibition were devoted to the Reservists' Fund.

Leeds.

ON Tuesday there was a one-day exhibition at the Artillery Drill Hall, Fenton Street, Leeds, by permission of the officer commanding the 1st West Riding Volunteer Artillery. There was a large number of visitors to see the motor-cars taking part in the Automobile Club's trial tour. Some there were who understood the means of propulsion used in varying forms in connection with the cars, but for the most part the people who walked between the rows of vehicles were merely attracted by curiosity, and the art of the coachbuilder was more to them than the engines and the gearing. The scene was a busy one throughout the day, attendants being busily employed in making good defects that had shown themselves during the

journey from Newcastle, and in cleaning and preparing for the seventy-four miles run to Sheffield on Wednesday.

Sheffield.

As the cars arrived at Sheffield on Wednesday they were directed to the Norfolk Drill Hall, Redmund Road, where they were exhibited during the evening. On Thursday morning fifty-two cars were in the hall, four having arrived after midnight, the drivers spending the night in the drill hall. Mr. R. A. Hadfield, the Master Cutler, performed the

A WELL-KNOWN QUARTETTE.

opening ceremony, to which we shall refer next week, and subsequently he and the local committee gave a luncheon to the private owners of cars and to the members of the Automobile Club.

SOME EXPERIENCES.

Note.

THE loss of a note-book last week was responsible for the omission of some interesting incidents. It must also be remembered that early starts in the morning and late arrivals in the evening do not facilitate obtaining information, and, also, that the times given in connection with the hill-climbing contests, etc., are subject to correction in the final records of the Trial, which will be published under the official sanction of the Automobile Club.

The Roads.

THE roads in some places in Scotland were not nearly so good, owing chiefly to the heavy rains, as were met with in Cumberland. Indeed, until the cars arrived in Cumberland, Cheshire held the palm among the motorists for the best roads, but after traversing the main roads of Cumberland the general feeling was expressed that, though hilly, the roads in that county possessed a more even surface than those of any other county which had been passed through. The secret of this consists in the use of clay binding, which produces a result like cement concrete. The one bit of patchy road met with was a bit of district road, under the Cockermouth Council, between Castle Inn and Bothel.

Opinion of a Traveller.

ACCORDING to Lord Kingsburgh, who during a few minutes' halt at Peebles expressed to the representative of the *Edinburgh Evening Dispatch* his enjoyment of the journey, the run has been a most satisfactory one in every respect. In the first place, it has been valuable as a test of what the motor-car can

accomplish, in the second place it has brought the machine prominently before the notice of the public as was desired, and in the third place it has been a most pleasurable experience. His Lordship added that he had enjoyed the first stage of the journey exceedingly, and hoped that the second stage would be similarly delightful.

Convincing Climbs.

THE hill-climbing contests on Shap Fell, Dunmail Raise, and Birkhill seem to have fully convinced many of the leading provincial journalists of the value and power of the motor-car, and all seem to have come to the same conclusion as the correspondent of the *Manchester Weekly Times*, who wrote:—These hill-climbing tests are a wonderful testimony to the practical value of motor-cars. If cars can easily and rapidly negotiate country like Shap Fell and Dunmail Raise, there is nothing, in reason, that they cannot do.

A Narrow Escape.

AMONG the few occasions on which horses and ponies proved objectionable was one which occurred on the way from York to Leeds. A pony in a trap, in which were two ladies, suddenly swerved across the roadway, but Mr. C. Johnson stopped the motor-car in almost the twinkling of an eye by throwing the machinery out of gear and applying the foot brake. The ladies leaped from the car, the driver was quickly at the pony's head, and all danger at an end.

The Daimler Char-a-Banc.

ON Monday Mr. Sidney Straker turned up at Leeds on his char-à-banc, having gone direct from Edinburgh and Newcastle. Certainly if pluck and perseverance are elements of success, Mr. Straker should win distinction, for it must not be forgotten that his vehicle is an experimental one, and has come straight from the works to undergo this severe test. The latest report from Sheffield showed it was still going well. This vehicle was illustrated in our columns last week.

PASSING THE TIME AWAY.

British v. Foreign Cars.

THAT British manufacturers are assuming a good position in the automobile industry is being splendidly demonstrated, and a correspondent describing the exhibition at Leeds says:—"Roughly, about half the machines whose travel-stained appearance excited such curiosity in the Artillery Drill Hall are of English manufacture. Their present condition and performances en route conclusively prove that the English manu-

facturer is rapidly making up the somewhat considerable gap which last year existed between the best products of English and French firms. This fact is further emphasised by an analysis of the fifteen cars which have dropped out of the competition, 75 per cent. of these being of foreign manufacture."

**Patience,
Perseverance,
and Philosophy.**

THE man who goes motoring must possess an equable temperament, and be prepared to accept the inevitable without flinching. Such a tour as that upon which the leading automobilists are now engaged calls forth many qualities, and to the exercise of patience and perseverance the motorist must add the spirit of the philosopher. He must learn not to be exacting in trifles, and to look at general results rather than particular instances. Having got clear of Bristol—the city of spires and charitable institutions—many of the travellers encountered a troublous season owing to the mediocre character of the spirit that had been supplied. Some were annoyed and sought to exorcise the feeling of irritation by remarks of denunciatory force and fervour. We will not report their utterances verbatim. In view of the temporary distress they lost their equanimity; but, strangely enough, all reached their destination in good time. Those who had suppressed their indignation showed the philosophic spirit which motorists should seek to cultivate. On such tours the rough paths cannot be wholly avoided, and must be regarded as equally a part of the experience and trial as the smooth and pleasant places.

Concentration.

NOT only does automobilism induce to the philosophic attitude, but it encourages concentration of thought. As one correspondent wrote of the drivers as they rode into Darlington:—"They looked as if they meant business. Life was real and earnest to them. Manipulating a car looks to an outsider the next serious thing to taking an ironclad into action. You don't speak to the man at the wheel. There is a far-away look in the eyes of the driver, or the owner who is his own driver—on the

JUST ARRIVED.

principle of 'every man his own lawyer'—that speaks volumes for the ability of concentration possessed by the human mind."

Luck.

BELIEVERS in luck have had many incidents to confirm their faith during the Trial. Some of the cars have dropped out of the competition—not because of the faults of the motor, but from other causes which can only be assigned to bad luck. Thus one car was put out of the running because of a broken

frame—for which the carriage builder and not the engineer must be regarded as responsible. Some of the other vehicles which have given up the Trial ought not to have entered, being of lighter design, admirably adapted for ordinary runs, but not quite fitted for such a trial of strength and endurance as the tour has proved itself to be.

**A
Splendid Feat.**

MR. GRAHAME WHITE, driving a Parisian Daimler, had an adventure on the run from Edinburgh to Newcastle. It appears that when seventeen miles north of Alnwick, on a quiet bit of road, he yielded to the request of one of his passengers to be allowed to try a hand at driving. The result

RELATING AN INCIDENT.

was that the said novice turned the car into the ditch, and the effect of this little contretemps was to break the bracket of the steering gear. There were still fifty-two miles of road to cover, but Mr. White was in no wise daunted, and conceived the idea—which he carried to a successful issue—of steering the car with his foot. Standing on the off step with his left foot, he kept his right on the hub of the off front wheel, and, by pressure only, he guided the car the whole way to Newcastle. What is still more wonderful, he averaged ten miles an hour for the fifty-two miles, and, as the road included several steep hills, two or three "controls," and a compulsory stop of a quarter of an hour for tea at Morpeth, he must have travelled at a good speed at several stages of the journey.

**The
Orient
Express.**

THE Automobile Association, Ltd., informs us that this car was unfortunately prevented from entering the hill-climbing competitions on account of the piston rod breaking at Manchester owing to a flaw in the material. After this had been replaced the driver in trying to avoid a cart went over the kerb into a ditch at the side of the road, and broke the car entirely.

**Accident
at Thirsk.**

ON Monday morning the motor-cars passed through Thirsk from Northallerton en route to York and Leeds. Excellent police arrangements had been made by Inspector Cook, who succeeded in keeping the road clear through the market square, it being no easy task, seeing that it was market day, and in addition the principal day of the May Day statutes. Save an accident to the Rev. Mr. Proud, vicar of Kilburn, there were no casualties. In the case referred to Mr. Proud was driving slowly along Inghramgate, when Mr. and Mrs. Chapman, from Hambleton, attempted to drive between Mr. Proud and one of the motor-cars, which was passing at the time, with the result

that a collision ensued, and both traps were overturned. The accident was no fault of the motor-car, and we merely refer to it here as the idea has got abroad that a motor-vehicle was the cause of the mishap.

Lord Kingsburgh.

THE presence of Lord Kingsburgh as a passenger in connection with the Automobile Club's Trial is a distinct gain to the movement, especially as regards Scotland. North of the Tweed his personal popularity is great, while the attention always given to his views has contributed not a little to the wide publicity given to the Trial in Scotland. Not only has he shown his personal interest in the subject of automobilism, but his strong advocacy at the Edinburgh Exhibition, and his quiet reproval of the authorities in high power in the Scottish capital who are opposed to motor-vehicles, was keenly enjoyed in a city where a public motor-car service is becoming more and more popular, and, let us hope, increasingly profitable. Certainly the Trial will do much to direct the attention of the canny Scots to mechanical traction on the roads.

Coles to Newcastle.

AFTER a fortnight's hard travel—for it is becoming increasingly clear that this trial is no mere holiday jaunt—the spirits of the automobilists are still maintained, and jocularly has prevailed despite the weariness of the flesh with which some of the wayfarers have been seized. Many conundrums have been asked, and some still await solution. One of the riddles which was solved on the banks of the Tyne came from no less a personage than the Lord Chief Justice Clerk of Scotland, who asked Mr. Hewetson why one of his Benz cars was like a popular proverb, and himself gave answer, "Because it is taking Coles to Newcastle."

A Query from Hodge's Widow.

As evidence of the curiosity being aroused in the rural mind by the Trial, a well-known patent agent at Coventry sends us a letter which he assures us he has received. It is as follows:

"SER,—Witch is the best motar car theirse bean sum parsin this wy and as soon as i eydon i just started pennin tuns of letters to the maykers and agints arskin ow much they pan art, cos it sims to me i mite git my roots and veggitables to markit cheeper that wy now my ole man's del morse the pitty an I dont want to go on makin a lorse on em with orses so dear orl along of the war offis.

"I stopt neeres tother dy it was a aughty car I spose as they was gents along of it their was a lot of fokes crowden rund it and one ole dame lern't a lot she did she arst wy it woodunt go an one of em sayd it was the benseen but tother sayd i can onley rite wot he sayd with pane and bayted breth. Dun he siz and sumthin alart puttin is boot on the heed got em both on for orl I cud see then he gives a turn to the hedge of a weel at the buck an orf they went sparp.—I am ser

"POLLY BOILEAU.

"Thay tells me as ow you no all alart em and i ope you will soon rite as i ope ile be able to ford one and that theirs pleanty maid as ime shore thay must be going like ot rolls."

"In Tow."

JUST outside the Newcastle control an interesting incident occurred. The cap of the axle of the De Dion voiturette driven by Mr. Egerton fell off broken. Mr. Moffatt Ford came along a few minutes later, and offered to take the De Dion in tow, an offer which Mr. Egerton accepted. With the help of a rope this was done successfully for some time, until the latter found the arrangement unsatisfactory, and throwing the rope away leant over, and with one hand grasped the back of Mr. Ford's car. The journey was thus pursued. Shortly after, as they were turning a corner, a horse drawing a railway lorry was startled, and turning sharply away, broke a lamp post, and nearly struck the adventurous automobilists. There was a great bother, the vanman declaring he did not like "snakes in the forest," and exhibiting a contempt for all who

drove without horses. Names and addresses were taken, and the crowd that quickly assembled were very much amused.

A Narrow "Squeak."

WHILE on the road from Newcastle to Durham Mr. Holder had an exciting experience, a horse backing suddenly across the road in front of his car. One of the passengers, relating the incident, says:—"If we had had tiller steering or solid tires we could not have avoided the onslaught of the cart, but the elasticity of pneumatics and the steadiness of wheel steering enabled us to charge the footpath boldly, although it was about nine inches higher than the road. The car shaved the hedgerow by a bare half-inch, and the backing cart just caught the corner of the rear off mudguard, but did no other damage. It was a narrow squeak, however."

Motor-Car v. Train.

WILL it be credited? The Hon. C. S. Rolls has been going at a high speed along a quiet country road. It is reported that between Otley and Guiseley his car had a neck-and-neck race with a North-Eastern express for three or four miles. The train then made a détour through a tunnel, whereas the road was straight, and when the train came through the car had forged ahead.

A Point to Remember.

THOSE who follow the order in which the cars have arrived at the leading towns—as given by "Observer," and also by our correspondents *en route*—should remember that in nearly every instance someone has been an hour behind the first starter, owing to the system of controls. Hence it does not follow that the car arriving last has lost so much time as might be supposed.

Illness of Mr. Cappellen.

ALL engaged in the Trial regret the sudden illness which has compelled Mr. Cappellen to return to town. He has been driving an International, which has travelled very well throughout the tour. When within six miles of the Leeds control he suddenly fell forward in a fainting fit. Fortunately he was only driving on the first speed at the time and although the machine went up a bank it did not turn over. Mr. Cappellen rallied sufficiently to take the machine into Leeds, but had to leave for London the next day. Mr. Billings is now driving the car.

Two of the Best.

MOST of the fifty cars now left in the competition are travelling well, and the 8-h.p. Napier is winning golden opinions. Although Mr. Mark Mayhew's Panhard went badly the first few days, it has lately picked up very well, and on Wednesday finished up not far behind Mr. Edge. Next week we hope to say something as to the cars which have done the best work in the Trial, and to deal fully with their performances.

Police Arrangements.

IN the large towns the police arrangements have been admirable—contrasting very conspicuously with the peculiar ideas of the Berkshire constabulary. At Manchester it was interesting to see the police urge the automobilists forward, and the action of the Bradford police was even more friendly. The head constable and mounted police kept the way clear, while constables lined the streets, and others held the flags. On leaving the town the vehicles were marshalled in capital style in a long line, and we would congratulate Bradford on the excellent tone adopted by its police authorities.

Ladies on Tour.

WHILE Mr. Edge has been driving Mr. Kennard's Napier, Mrs. Kennard has been driving her De Dion voiturette, and, apparently, enjoying the trip. She went up Shap Fell on the quad driven by Mr. J. W. Stocks, and descended at a great pace in front of Mr. Holder's twin Daimler. The three ladies mentioned—Mrs. Bazelgette, Mrs. Friswell, and Miss Butler—are still on tour, and apparently enjoying the experience.

In Defence of the Low-Bred.

THE horse is a confirmed conservative; like the cart he drags, his slow mind settles into ruts. In his view man was created to be drawn in a cart, and he asks nothing better than to bear man's mild yoke for ever. Fancy then his perturbation at meeting a procession of vehicles unmistakably horseless, moved "like the wind," by some mysterious hidden agency! Well may the patient journeying horse be the terror of the watchful motor driver. Poor beast, his powers of expression are limited, but as the car passes, his wild eye and beating hoofs sufficiently attest his alarm. Once, as we descended a hill, we met a splendid black-maned cart horse, lumbering along in dignified leisure. The car

knife polish, and ground valve in. Joy! for five miles; then woe, shoving, and regretting that he had never been satisfactorily taught how to swear. Anon she bumped anew, and he went gaily on for a few miles, when suddenly some petrol spurted up through the chimney, and then air came—puff, puff, puff! He stopped, opened the valve chamber, and found the split pin of the inlet valve in fragments and the valve spring dancing about. Putting in a new split pin, he resumed the trip, went the last few miles at top speed, and finished the day in peace with all the world, thinking that all his sorrows were at an end.

On the Wednesday he carefully lubricated and tested everything before starting from Carlisle. The machine's behaviour began with a series of dying-away evolutions, which Mr. Wilson ascribed to a combination of bad petrol, moist air, and weak sparking. Once, after she had stopped dead, he sat down on the roadside, occupied exactly two hours in taking the engine down and re-fitting, examining all contacts, putting new trembler and platinum screw, and so on. Then he had to shove the machine up Birkhill. After lunch the machine resumed, alternate flying free and dying away, with occasional jerky stops. Messrs. Sturmev and Swindley wanted to tow him, and then Mr. Cordingley came along, and seeing how impossible it was to move the trike (the wheels were almost locked), insisted on towing him. They got a rope, and the tricycle was towed for a

EN ROUTE FROM NEWCASTLE TO LEEDS.

[Photos by]

[Mr. Percy Richardson.]

whizzes under his nose; he rears on his great haunches pulling his diminutive guardian off his feet, and breaks away in sheer panic. It is interesting to contrast the unfeigned alarm of the simple cart horse with the gentlemanly reserve of the well-bred carriage horse. He is quite as much frightened, but far too refined to show a vulgar lack of self-control. Accordingly, he steps past with a shade of added hauteur. The alarm in his bright eye alone betrays him.

HALF-WAY ON A MOTOR-TRICYCLE.

MR. A. J. WILSON has had a wide experience of motor-tricycles. In fact, he has written a book about them; and doubtless, in the next edition, will be able to add an interesting chapter on his experiences during the 1,000-mile Trial. His ride on the Ariel motor-tricycle was not wholly a pleasant one. After carrying him splendidly to Manchester, the machine began to jib *en route* to Kendal. At Kendal he spent four hours in the morning wrestling with the motor. As the dovetailed ends of the piston rings were broken, he put new ones in and started for Carlisle. But the jibbing continued, although cautious riding was indulged in. Ultimately he sat down and took out exhaust valve, got some

mile or so; then at a sharp corner Mr. Wilson had to let the rope go; the machine instantly stopped dead, and he turned back and ran down hill to a little roadside hotel. There he sat down again, and proceeded in a vein of calm and philosophic contentment to take the whole concern to pieces. He resolved the affair into its primitive components, examining everything minutely. "Eureka!" The cylinder was scored by two deep parallel lines, about half an inch apart. Searching for the cause, he found it. The bolt which joins the piston to the top of the piston-rod should have a split pin through its thin ends, to prevent it turning round. There was no split pin! Some fragments of steel were all that remained of it. Consequently the bolt had been turning round; when it rested for a time in one position, all was well; but when it turned a quarter round, it edges scraped against the cylinder, causing a jamming action which stopped the up-and-down movement.

He had no spare split pin, so tried to obtain a suitable nail, failing which he selected a spare screw and laboriously filed it down to the correct size to jamb in the place of the split pin. He had also a new piston in his bag, and as the three new rings (put in only the previous day) were already broken, he determined to fit the new piston. But the new piston was without a split pin; hence he had to make a substitute by filing down a screw.

It took just three hours to complete this job, and he started off before dark, hoping to get past a certain dangerous hill in daylight. But whether it was now only the bad petrol and feeble sparking, or whether his improvised pin had worked out or not, is not known. Certain it is that three miles was the limit of his run, and then he did another mighty shove uphill, stopping to rest now and again—alone in the midst of lofty rolling hills that would be entrancingly admirable under ordinary circumstances. When he got to the "dangerous hill" he found that it was no great shakes; and the rapid descent warmed up the petrol, so that the machine bumped fairly well until he ran into Innerleithen.

The last we heard about the matter was that Mr. Wilson had decided to take the machine to Edinburgh by train, send it to Birmingham, and return to London as a passenger—by train or motor-car.

INCIDENTS.

THERE were quite a dozen private motor-cars at Dunmail Raise, in addition to those engaged in the Trial, the smartest being the steam car belonging to Mr. Buxton, of Sawrey, in Lakeland.

DURING the exhibition at Edinburgh the cars of the Edinburgh Motor-Car Company and several of the competing cars were driven round the Market Place, and afforded many people an opportunity for a spin.

OF the first four cars in Newcastle-on-Tyne three were of English manufacture.

A SMART repair has been reported from Alnwick, where a driver discovered that a valve had broken, and that a piece of it had fallen into the cylinder. He disconnected all the parts, took the cylinder apart, refitted it, and was moving again in less than twenty minutes.

THE CARS AT YORK.

ONLY nine vehicles succumbed in the first 500 miles of the Trial, and of these three were experimental cars.

TRIBUTE was paid by the Leeds journalists to the way in which the cars romped into the drill hall at Leeds. "Even a big Daimler car," said one, "built to carry eleven persons, dashed round the hall like an infuriated monster, but was brought up within an inch of the space allotted to it."

SIX motor-tricycles and two motor-cars from Sheffield went out on Wednesday as far as Barnsley to meet the vehicles engaged in the Trial.

SOME of the northern industrial establishments, like the Darlington Forge, allowed their men an hour off to see the vehicles.

As the cars passed through Morpeth a local policeman cautioned some of the drivers not to smoke when on the cars; which shows how careful policemen can be—sometimes.

According to the *Leeds Mercury* one of the cars arriving at Sheffield on Wednesday was the "Die Don Vatinvette," bearing a lady who had "ridden the whole of the 1,000 miles." Adapted as a draper's delivery vehicle that car might be further disguised as "The Don Satinette." Certainly we object to anything of the "vette" or "vet" in connection with automobiles.

MR. H. STURMEY, who has flitted from car to car, and Mr. H. J. Swindley, who has accompanied Mr. Lord on his Peugeot (which, by the way, has gone splendidly), have acted as time-keepers on the hill-climbing tests.

THE casualties of the week have been, so far as we can learn, few and small. The deaths of one hen and a little chicken are the only fatalities that can be attributed to the motor-cars.

MR. J. H. PEASE was one of the private motorists who saw the cars go into Darlington.

FIVE cars entered by the Motor Car Company have gone safely through the Trial, and all were at the exhibition at Sheffield—they having thus covered 855 miles.

SIR HOWARD and Lady Vincent, who returned to Grosvenor Square, London, last week, have engaged an Oppermann electric victoria for the season.

A TWO-MILE motor race for professionals was run off at Catford on Saturday. In the final heat Mr. F. F. Wellington (Phébus Aster tricycle) beat Messrs. E. James and W. J. Burnley (tandem) easily by 150 yards. Time, 3 mins. 5½ secs.

THE James H. Lancaster Company, of New York, has just brought out the first of its line of petrol cars. The new vehicles are said to embody a number of novel features in construction and design.

THE Automobile Company of Great Britain and Ireland, Limited, was registered on May 3rd by A. S. Ramskill, 40, Holborn Viaduct, E.C., with a capital of £100, to carry on the business of manufacturers of and dealers in all kinds of vehicles, whether propelled or drawn by steam, oil, electricity, or any other mechanical or animal power. Registered without articles of association.

AT a meeting of the Institution of Junior Engineers, to be held at the Westminster Palace Hotel, S.W., on Friday next, a paper entitled "A Short Review of the Motor-Car Industry" will be read by Mr. Basil H. Joy and Mr. Chas. H. Rush. The paper, originally announced for May 4th, has been, at the request of the authors, postponed by the council as above, in order that the results of the 1,000-mile Trial may be dealt with in the appendix to it. Mr. Bertram C. Joy, announced as the joint author of the paper, being prevented by illness from attending to it, his brother has kindly taken his place.

MESSRS. BROWN BROS., LTD., of Great Eastern Street, E.C., have sent us a copy of their new 1900 wholesale list of motor-vehicles, fittings, frames, accessories; etc. The list, which extends to about thirty pages, gives illustrations and particulars of the Brown-Whitney steam car, the Brown motor-tricycles and quadricycles, fore carriages and trailers, etc. Three pages are devoted to De Dion motors and parts, two to the parts of a 3½-h.p. Benz type motor, made by the Star Motor Co., while in the remainder particulars are given of a variety of accessories, such as carburettors, voltmeters, lubricators, horns, saddles, bags, tires, lamps, chains, chain-wheels, &c. The list should be in the hands of all connected with the motor industry.

THE "HOLBORN" HEAVY-OIL CAR.

WE are now able to give two illustrations—a general view and plan—of the little two-seated car exhibited at the Agricultural Hall by the McLachlan Engine Company, of 14, Holborn Viaduct, London, E.C. The motive power is

THE HOLBORN HEAVY-OIL CAR.

supplied by a horizontal single-cylinder motor located towards the rear of the frame; it is capable of developing up to $3\frac{1}{2}$ h.p., and, although adapted for using ordinary paraffin oil as fuel, will, it is stated, work equally well with petroleum spirit. The cylinder is water-jacketed, while the ignition can be either electrical or by means of an incandescent tube. Two speeds, about four and fifteen miles per hour, are provided, the motor-shaft driving the counter-shaft by spur-gearing connected with a double-acting clutch, while a single chain connects the counter-shaft with the rear axle. The frame is built of steel channels, the body of the car, which completely encloses

the motor and gear, being of polished walnut. The road wheels are of the suspension type with pneumatic tires. Two brakes are provided—one acting on the fly-wheel of the motor, and one a band brake on the rear axle. The car is well suspended, the bearings being supported by horn cheeks and the frame and body on helical springs. Steering is controlled by a tiller, the speed

PLAN OF HOLBORN CAR.

varying wheel being at the side of the car. The weight complete is about 5 cwt.

THE Automobile Club of America has issued a pamphlet of fifty-six pages in the interest of good road agitation. It contains a list of officers of the club and the various addresses delivered before that body. The pamphlet is almost entirely devoted to the improvement of the highways of the State of New York.

THE following tale is told by a Yankee contemporary in connection with an account of a recent automobile trip in America. It appears that on the route a stiff hill was encountered which the car refused to climb on the slow forward speed. As the reverse motion was much slower, the carriage was turned about and backed up the hill without further trouble!

BIRD'S-EYE VIEW OF DAIMLER CAR WITH BODY REMOVED.

CORRESPONDENCE.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR.—In your issue of April 20th last, the Hon. L. Canning writes a long letter in which he has seen fit to make many unjust statements concerning my machine. I have no wish to enter on useless discussions with him as regards technical questions, questions which Mr. Canning treats in so remarkably superficial a manner, but there is one statement he makes, and one which I cannot pass over in silence—i.e., his insinuation that the Moto-cyclette should be looked upon as a dangerous machine. I formally challenge him to cite a single accident, due to the Moto-cyclette, having occurred to any of the thousands who ride the machine in France.

Yours faithfully,

M. WERNER.

40, Avenue de la Grande Armée, Paris.
May 7th, 1900.

A DE DION MOTOR PHAETON.

AS already mentioned in these pages, among the many cars shown by the Automobile Association, Limited, of Holland Park Avenue, W., at the recent exhibition at the Agricultural Hall, was a 3-h.p. De Dion voiturette fitted with a special four-seated phaeton type of body. We are now enabled

to give an illustration of the little car which so far as the motor and mechanism are concerned is identical with the voiturette. The two rows of seats—one of which can be fitted with a hood—are interchangeable, so that the hooded one may be at the front or rear, as desired. The steering and control levers are so mounted that the driver in all cases occupies the front seat.

THE Motor Cycle Company has just been formed at Norfolk, Va., U.S.A., with an authorised capital of 150,000,000 dols. (£3,000,000)!

OWING to the growth of their motor business, the Progress Cycle Company, Ltd., of Foleshill, Coventry, has decided to separate this branch from the cycle factory, as there is no longer room for both at Foleshill. The premises of the late Coventry Wheel Company at Bishopgate Green, Coventry, have been purchased, as well as ground adjoining, where the Progress motor-vehicles will in future be constructed.

THE first motor-tricycle race in America was run off at Woodside Park, Philadelphia, on Saturday, April 21. The occasion was the meeting of Mr. C. C. Wridgway, of London, and Mr. Kenneth Skinner, of Boston, in a match race for £30 a side, the race to be of one hour's duration. A flying start was made, and Skinner slowly forged to the front until, at the end of ten miles, covered in fifteen minutes, he was a lap ahead. Here something went wrong with his machine and he was obliged to drop out. Wridgway continued alone, riding out the hour, covering within that time no less than 38½ miles.

THE ELDIN WATER-CIRCULATING PUMP.

A NEW water-circulating pump for use on motor-cars has lately been introduced by Messrs. Eldin and Lagier, of Place Bellecour, Lyons, France. Fig. 1 gives a general view, and Fig 2 a section of the pump from which it will be seen that it is not only mounted on springs, but that the shaft is sup-

FIGS. 1 AND 2.

ported on bearings at both sides. The flywheel is arranged to be driven by frictional contact with the flywheel of the engine. It is built up of two parts, enclosing a leather disc, so that when the latter becomes worn it can be quickly renewed. The pump is being made in two sizes.

THE Eclipse Automobile Company has been organised at Portland, Me., to manufacture and deal in automobiles and electric apparatus used in their manufacture. The capital is £30,000.

LA COMPAGNIE DE TRACTION PAR TROLLEY ET AUTOMOTEUR (Procédés Lombard-Gerin) is the title of a company which has just been formed in Paris, with a capital of £80,000, to exploit a system of overhead-conductor driven electric road vehicles.

A MOTOR-CAR race from Mannheim to Pforzheim and back is being organised by the Rheinische Automobile Club. The race, which is to be run off on May 13th, is divided into the following four categories:—(1) motor-cycles, (2) voiturettes, (3) touring cars, and (4) racing cars. The distance is about 165 kilometres.

MOTOR-CARS ON THE CONTINENT.

(From our Correspondent.)

A New Transportation Company.

THE number of transport services effected by self-propelled vehicles continues to increase, a sure sign that those already working are giving satisfaction both to their promoters and to the public making use of them. And the services are in several instances very far afield, in regions where repairs are not too easily effected, and renewals difficult to obtain. These lines afford additional proof that, provided care and attention be given to the vehicles, public service work can be profitably carried on. The latest company formed for transportation proposes to run a service of automobiles between Mahatsaro and Antananarivo in Madagascar, a distance of 250 kilometres, that is some 156 miles. This is no light undertaking.

In Austria.

FROM Vienna comes the news that on Tuesday, the 1st instant, there occurred at Nesselsdorff, in Moravia, a serious accident, the consequences of which are already being felt in the automobile world. It appears that a party of engineers were making a trial trip on a 9-horse power car. When in the course of their essay they arrived at the summit of a fairly steep hill in the environs of Nesselsdorff, the driver took his vehicle down this grade at a high rate of speed, and unable to negotiate the sharp corner at the foot, he overturned the car. Of the five occupants, one shattered his head against a kilometre post, and three others were seriously injured. As a result of this terrible affair the police have prohibited the hill-climbing race between Vienna and Kahlenberg, organised by the Automobile Club of Austria for Sunday next. It is also certain that the conditions of the Munich-Vienna course will be considerably modified, even if the event be not entirely suppressed. The original arrangements provided for the race being decided in three stages, the initial run being fixed to take place on Thursday, the 31st instant. Automobilmism is having rather a bad time of it on the Continent just at present, but the trouble will blow over if motor men are content to turn their backs to the storm, and not aggravate matters by any display of feeling.

An Accident on the Versailles Road.

ON the 26th ultimo Mme. de Hegermann-Lindencrone, wife of the Danish minister, accompanied by her daughter and a gentleman friend, were returning to Paris from Versailles, when, in descending the famous hill of Picardie, a tire of the automobile in which they were seated burst, and the car overturned. Mme. de Hegermann-Lindencrone was severely contused and the gentleman passenger had his arm broken, but at the moment of writing both are making satisfactory progress towards recovery. Fortunately a gentleman was passing the scene of the accident, who placed his carriage at the disposal of the unfortunate motorists, and consequently they were enabled to reach Paris most comfortably and with the least possible delay.

Electromobile Tests.

FOR the second time the B.G.S. electric car has failed to do itself justice, and again through no fault of the vehicle. As related last week in these columns a *caniveau* brought about disaster to the car when competing in the Critérium d'Electricité, and the 92 kilometres actually covered in no way represents the staying powers of the B.G.S. Now a collision with a carrier's cart has brought to an untimely end MM. Bouquet and Garcin's second attempt to show the public what their vehicle is capable of. It was on May 1st that the constructors made their second trial, the departure taking place at 2 o'clock from the Porte Dorée. Capital progress was made,

and at Montereau a lead of a quarter of an hour was held over M. Krieger's record made in the Critérium d'Electricité. The would-be recordists were highly elate, and self-congratulation was the order of the day, for everything pointed to the annihilation of M. Krieger's figures. Alas! however, for human hopes and aspirations, the unexpected arrived, and just before entering Villeneuve-la-Guyard a plunging horse caused a collision between the cart to which he was harnessed and the B.G.S. Result: front axle of the electromobile broken and further progress impossible.

The Atlas Voiturette.

THE accompanying illustration shows the "Atlas" two-seated voiturette, made by M. J. Prunel, of Puteaux, and which is being put on the market by M. E. J. Brierre, of 239, Boulevard Péreire, Paris. The car is propelled by means of a 3 h.p.

water-cooled De Dion motor, located under a "bonnet" in the fore part of the frame. Two forward speeds—10 and 30 kilometres per hour—and a reverse motion are provided, the power of the

motor being transmitted through a pedal-controlled friction clutch to a longitudinal shaft. The latter is geared by bevel pinions to the differential shaft, the usual sprocket wheels and chains conveying the power to the rear axle. Two brakes are available, the steering being controlled by an inclined hand-wheel, on the standard of which the various levers are grouped. The frame is spring-suspended on cycle type wheels and pneumatic tires. The car complete weighs a little over 5 cwt.

The Nice Decisions.

It will doubtless be recollected that the decisions of the Nice judges met with anything but universal approval; indeed, in many quarters they were considered to be arbitrary and distinctly unfair. One of their rulings which gave rise to considerable dissatisfaction was that by which they declined to classify Théry and Jules Dubois, two competitors in the voiturette category of the Nice-Marseilles-Nice course, and at the time it was generally considered that M. Ravenez, the chairman of the Décauville Company, in whose interests the two *chauffeurs* were racing, would institute legal proceedings against the organisers of the meeting for the purpose of obtaining the advertised rewards. Ultimately, however, M. Ravenez decided to place the matter before the Sports Committee of the Automobile Club of France, and last week his appeal and the reply of the Nice officials were under consideration, and with a result unfavourable to M. Ravenez. At the same meeting there was considered the ruling of the Nice stewards, whereby the Nice-Marseilles-Nice event was declared to be terminated at Aubagne, so far as the large cars were concerned, and the classification at that point taken as the final classification. The Sports Committee held that this decision was in contradiction to Article 31 of the racing rules of the "A.C.F.," which stipulates that an event can only be considered as terminated and a classification made when the entire advertised course has been covered. This is the only judgment that the committee could deliver, for it is obvious that if race promoters held the right to declare a race terminated at

any point *en route* by reason of weather conditions or other causes frequent disagreements would arise. The club's racing rules have been so carefully and minutely prepared to meet every possible contingency that they should be rigidly adhered to and not regarded as of an elastic nature. But the Sports Committee will assuredly see to that.

At Achères.

LAST week I chronicled in these columns the startling performance achieved on the Achères road by M. Caron, an amateur motor-cyclist, and I had anticipated being able to record in the present issue a still faster trial by the same motor-cyclist. But, alas! even the park of Achères is closed to the would-be record breaker unless, indeed, he makes a formal application for permission some days before the selected date, and is honoured with a favourable response. It was on Friday last that M. Caron, accompanied by MM. Gaudichard and Perrodil, the official timekeepers, journeyed out to Achères, and the conditions being entirely favourable to fast travelling, some altogether exceptional times were anticipated. Just as the *chauffeur* was putting the finishing touches to his machine, however, the head keeper of the park appeared on the scene, and stated that he had received formal orders to prohibit speed trials taking place. Immediate application was made to the authorities in Paris to permit the trial, but unavailingly, and now permission is only accorded where several days previous notice has been given. Poor *chauffeurs*! What a difference to the time, not so long ago, when you were supplicated to go record breaking at Achères; but such is the way of the world, and the good days will come again.

A Race at Tours.

ON Sunday last at Tours the local automobile club, risking all manner of terrible penalties, decided a fifty kilometre road race for voituresses and motor-cycles, and it will be interesting to see what punishment will be meted out to these defiers of their country's laws. The race itself was run under the happiest of conditions—meteorologically—and very fast times were made. The placed men were—Voituresses: 1, Foulon; 2, Bruneau. Motor-cycles: 1, Barret; 2, Clément. Later in the day a motor-cycle race was decided on the cycle track, and in all probability Barret would have again figured as the winner but for a series of punctures which occurred when he was leading the field by twenty laps. The actual winner was found in Hamel, Rosière being second, and the unfortunate Barret third.

Parc des Princes.

IN the absence of road races, now, alas! prohibited, at any rate in the vicinity of Paris, attention is directed towards the track, and on Sunday last a motor-cycle course was successfully introduced into the Parc des Princes programme of ordinary cycle events. Certainly no track races will ever compensate for the lost glories of the road, but there are numbers of motor enthusiasts who believe that half a loaf is better than no bread, and accordingly flock to see the champions careering round an enclosure like wild birds in a cage. Sunday's race was one of an hour's duration, and prizes of £20, £10, £6, and £4 were put up for competition. Of the eleven entries ten men lined up at the start, the absentee being Loste. Upon the signal being given Joyeux was quickest away, while Béconnais, on the other hand, got into his stride but slowly, owing to the nasty temper displayed by the new motor which he was riding. But this ebullition of feeling was only of short duration, for after a little masterly coaxing by the *roi des chauffeurs*, the obstreperous engine consented to bestir itself, and quickly carried its rider to the front at a pace which left the other competitors as if standing. Continuing his furious march, albeit in a cloud of smoke through over lubrication, Béconnais had secured a three-lap lead on the field shortly after covering thirty kilometres, but then the ebonite of his ignition cam broke, and he was passed by both Osmont and Vasseur while engaged upon the necessary repairs. From

that point Béconnais had a busy time in endeavouring to persuade the mount that he was riding, and it was not until some fifteen minutes from the time limit that the peevishness of the motor was again overcome. By way of varying matters the tricycles ridden respectively by Vasseur and Osmont also indulged in a few eccentricities, the performance of the former machine being particularly striking. The left wheel of this cycle suddenly decided to do a little racing on its own account, and accordingly abandoned the tricycle and careered off at forty miles an hour round the track, until its progress was arrested by a courageous policeman, who blandly explained, no doubt, that, holding no *permis de circulation*, its performance was a direct contravention of its country's laws. As for Osmont, his pneumatic having burst he considered it quicker to replace the entire wheel than the tire alone, and accordingly did so. Only, unfortunately, in the absence of a wheel of similar dimensions to the original, he was compelled to utilise one considerably larger, and his cycle presented a truly curious appearance as it raced round the track with the outer wheel some centimètres larger than the other two. All the other competitors had their troubles, and at the termination of the sixty minutes the order was:—

	Kilomètres.	Mètres.
1. Osmont.....	61	720
2. Fossier.....	60	666
3. Joyeux.....	57	333
4. Béconnais.....	55	335
5. Bathiat.....	52	333
6. Jallu.....	48	—

Abandoned: Rigal, Vasseur, Bertin, and Ariès. The machines ridden by all the competitors, with the exception of those mounted by Jallu and Ariès, were extremely powerful. Osmont, Vasseur, and Bertin each had a couple of motors, 80 by 80 mm., attached to their machines, while Bathiat employed an engine of two cylinders. Béconnais, Fossier, Joyeux, and Rigal used a single cylinder motor of 90 by 120 mm.

General Meeting of A.C.F.

THE annual general meeting of the members of the Automobile Club of France will be held on Tuesday, the 29th instant, at 4.30 p.m., in the salons of the club-house. The agenda is as follows:—
(1) President's address, (2) treasurer's report on the receipts and expenditure, 1899, (3) adoption of accounts, 1899, (4) budget 1900, (5) ratification of the election of new members of the committee. The club's Salle des Fêtes being still unfinished, it appears to me that the only place on the premises sufficiently large to accommodate anything like a representative gathering of members is the *garage*, where 1,000 persons could be comfortably seated.

THE Century Motor Vehicle Company has been formed at Syracuse, N.Y., with a capital of £6,000.

LA SOCIEDAD AUTOMOVIL DE BURGO DE OSMA is the title of a company which has just been formed to establish a service of motor-vehicles for the transport of both passengers and goods between Logrono, Soria and Osma, Spain.

THE AUTOMOBILE MANUFACTURING CO., LIMITED, has been registered with a capital of £100 in £1 shares, to acquire the business carried on by W. C. Bersey at 4, Hythe Road, Willesden, N.W., and the business of the Southern Motor-Car Company carried on at 59, Brixton Road, S.W., by Messrs. Townsend and Bizzey, and to carry on the business of electrical and general engineers, motor carriage manufacturers, etc.

WE learn that Messrs. Brown Bros., Limited, of Great Eastern Street, London, E.C., have lately acquired the patent rights of the Starley axle as applied to motor-cycles and cars. The parts covered by this patent must not be confounded with the original Starley patent referring to differential driving gear. The portion protected by this patent is that relating to the construction of the axle and the method used to adjust the bearings. All "Starley" axles, whether English or foreign, must in future bear a licence plate.

THE HUDLASS PETROLEUM SPIRIT MOTOR-CAR.

WHEN at Preston last week, in connection with the 1,000-mile Trial, we had an opportunity of inspecting the motor-car which has lately been introduced by Mr. F. W. Hudlass, of the Motor Works, Ivy Street, Southport, and of which an illustration is given herewith. The car, which has seating accommodation for five persons, is driven by a horizontal single-cylinder petroleum-spirit motor capable of developing up to 6 h.p., the diameter of the cylinder being 6 in., and the stroke 6 in. The engine, which weighs less than 2 cwt., and is well balanced, is provided with electric ignition and water jacket; the speed ranging from 200 to 800 revolutions per minute. The water circulation is maintained by a pump, a Clarkson-Capel radiating coil being introduced in the circuit. Three speeds are provided, ranging up to a maximum of twenty-five miles per hour; the transmission is transmitted by $2\frac{1}{2}$ -in. belts to the

countershaft, and from the latter to the rear road wheels by the usual sprocket wheels and chains. A separate handle is provided at the side of the steering stand for each of the three speeds. Steering is controlled by a lever; the frame is of channel steel, while the wheels are of wood shod with solid rubber tires. Two brakes are provided, the car complete weighing 15 cwt. The motor is stated to work equally well with common benzoline or stale petrol. On the day we met Mr. Hudlass he drove the car sixty-five miles, using $3\frac{1}{2}$ gallons of petrol which had been discarded as too stale by a motor cyclist, while the circulation water at the end of the run was only lukewarm. Mr. Hudlass assures us that the car will mount any ordinary hill at a speed of ten miles per hour.

OUR Midland correspondent informs us that the recently-formed Panhard-Levassor Company have purchased the Beeston Motor factory in Coventry.

A COMPANY has just been formed in Paris with a capital of £24,000, and with a title of La Société des Etablissements Marot et Gardon, to acquire and carry on the business of motor-cycle manufacturers of Messrs. Marot Gardon.

ACCORDING to a consular report motor-cars have already found their way into India. The North-Western Provinces Government has sanctioned the experimental running of motor-cars on the Sitapur Maholi road.

THE subject of automobile lines of communication has been creating a fair amount of interest in the Corunna district during the past year, and it is probable, says a Consular report, that two lines will be opened for traffic during the current year. These lines, if successful, will be an immense boon to the inhabitants of the districts, superseding the lumbering, old-fashioned, slow, and most incommensurable "diligencias."

MOTOR-CAR PROSECUTION AT LOWESTOFT.

CONSIDERABLE interest was manifested in a prosecution which took place at Lowestoft Police Court on Monday, as it was one outcome of the recent motor-car accident, by which several persons were injured, though fortunately, none seriously—Mr. William Robert Youngs, motor-car proprietor, Lowestoft, being summoned by the police for driving a motor-car to the common danger of the public in Ravine Road, at Lowestoft, on April 19. Mr. Harold Chamberlain appeared for the defendant, and pleaded not guilty. James Mann, Barrack Street, Norwich, said he saw the motor going down the Ravine, at, he should say, fifteen or twenty miles an hour. He was going up the Ravine on a bicycle, but jumped off to watch it pass. He saw it run into a mail cart. He considered the car was travelling at a very dangerous rate.

Mr. Chamberlain, in addressing the Bench, said that he should not attempt to justify Youngs in driving down such a place as the Ravine at ten or fifteen miles an hour. He contended that the car was not travelling more than six miles an hour. One was very liable to get an exaggerated idea of speed of vehicles which made a noise, such as motor-cars. The whole cause of the accident was that the cyclists, as he contended, crossed to their wrong side as the car approached, thus causing the defendant to put his steering-gear "hard-over" suddenly. Defendant was then sworn, and stated that he did not go down the Ravine at more than six miles an hour, and the car was perfectly under control. Both cyclists went their wrong side, and he steered suddenly to his wrong side to avoid them. If he had suddenly applied his brakes he would have crushed the children, and have thrown his passenger and himself off the car. Having touched the mail-cart, he steered to the other side of the road, and stopped the car on the bank, having by that move run upon a Mr. Boyes, whom he subsequently drove to his home. When he first saw the children, his road was perfectly clear. The Bench having retired for a short time, the Chairman said they were unanimously of opinion that the defendant was driving the car at a rapid rate, not only to the danger of himself and his passengers, but also to the danger of the public. The Bench wished him to say that they were of opinion that persons who drove motor-cars should be especially careful in going down such dangerous places as the Ravine, and as far as possible should avoid them. To mark their sense of the danger, and of the rapid rate at which he was driving, Youngs would be fined £3 15s., and £1 5s. costs, or fourteen days' imprisonment.

THE CHARGE AGAINST A DIRECTOR.

AT the Central Criminal Court before the Common Sergeant, the trial of Sydney Frederick Atkins, on bail, upon an indictment charging him with that, being a director of the Automobile Association (Limited), he did fraudulently apply to his own use certain sums of money belonging to the company, took place on the 3rd and 4th inst. There were counts in the indictment charging the accused with falsifying the books of the company. Mr. J. P. Grain and Mr. Peter Grain prosecuted; Mr. Charles Mathews defended. The company was formed about two years ago, the registered offices being in Prince's Road, Holland Park. Signed blank cheques were intrusted to the defendant to be filled up for the purposes of the business of the company in the absence of the other directors, and the allegation was that three cheques for £16 17s. 6d., £22 10s., and £44 17s. respectively had been cashed by the defendant on his own account, although the amounts were entered in the books of the company as payments for commission on the sale of motor-cars. The accused gave evidence, and stated that the money was all expended on the business of the company. Mr. C. Mathews, in addressing the jury, urged that the defendant's story was fully borne out by the documents and correspondence in the case. The jury announced that there was no prospect of their agreeing, and were discharged.

RENAULT v. THE MOTOR-CAR COMPANY, LIMITED.

In the Chancery Division on the 4th inst., Mr. Warrington, Q.C., said that it had been arranged that the motion in the above action, which was to restrain the defendants from passing off motor-cars of their manufacture as that of the plaintiffs, should stand over for a week.—Mr. Justice Kekewich: Very well.

FURIOUS DRIVING CASES.

AT the Bradford City Police-court last week, Mr. Graham White, of 41, Queen's Road, Manningham, was fined £1 and 8s. costs for furiously driving a motor-tricycle through a public thoroughfare. The offence was proved by Police-constable Marshall, who said defendant rode his machine along Market Street in 30secs. The distance was 300yds., which would foot up at the rate of twenty miles an hour. Defendant said he could not possibly have done that speed. He, however, admitted that he had perhaps exceeded the limit of eight miles an hour, but he was not travelling faster than ten miles an hour.

AT the Long Ashton Police Court last week, Mr. Richard Howard was summoned for furiously driving a motor-car at Clevedon on March 30th. Mr. E. J. Pillers (Bristol) represented the defendant, who was not present. P. C. Bickell deposed that on the day in question when in the

Elton Road he saw a motor-car with three gentlemen in it going at a rate of between sixteen and twenty miles an hour. He put up his hand and shouted "stop," but no notice was taken, and the same speed was maintained. Several complaints were received as to the speed the motor-car was driven. On April 2 witness saw defendant at his house at Westbury, and he admitted he was there and that he ran over a fowl. Arthur Ernest Thomas stated he was in the Old Church Road and saw a motor-car coming from the direction of the beach at the rate of twenty-five to thirty miles an hour. The car passed in a cloud of dust, and it was impossible to recognise anyone. The only thing he could compare it to was an express train passing through a station. Afterwards he met P.C. Bickell and made a complaint. William Gilson said he was in charge of a horse and cart in Elton Road when a motor-car flew round the corner and caused his horse to back into another horse and cart, breaking the shaft and a portion of the harness of the latter. It was going at the rate of sixteen or twenty miles an hour. The motor-car stopped, and he asked the gentleman who was going to pay for the damage. One of them said it was witness's fault, and they went on. Cross-examined—The motor-car pulled up within six yards. William Grey, who was in charge of the cart that was damaged, also said the car was going at the rate of between sixteen and twenty miles an hour. It pulled up or it would have gone into Gibson's horse. Mr. Pillers said his client was away from Bristol, but for the defence he wished to say that the car was under complete control and could be stopped in its own length. The car had been used in all parts of England, and there had been no other complaint. He would remind their worships also that there was no traffic at the time. The Bench came to the conclusion that the motor-car was going beyond twelve miles an hour and imposed a fine of £1 and costs.

At the Cambridge Divisional Police Court last week, Mr. Charles R. Mortimer, cycle manufacturer, of Corn Exchange Street, Cambridge, was summoned for driving a motor-cycle at a greater speed than twelve miles an hour at Trumpington, on April 22nd. Defendant pleaded not guilty. Mr. S. J. Miller appeared on his behalf. P.S. Warren said that on Sunday, in consequence of instructions from Superintendent Webb, he went to Trumpington, conferred with P. C. Salmon, and placed him in a position in the middle of the village, and gave him instructions to book the exact time every motor passed him. They compared their watches and put them exactly with each other. Witness then left him, and took up a position near the Shelford Road, 600 yards away from Salmon, measuring the distance with a tape. The defendant passed witness at 11.58 in the morning, going towards Cambridge, then travelling at over twenty miles an hour on a motor-car with a lady in front. Witness afterwards compared his book with Salmon's. In cross-examination, witness said four motors passed him altogether, and all were going at over twenty miles an hour. P.C. Salmon said the defendant passed him at barely 11.50, so that he must have done the 600 yards in under a minute. Witness and Warren compared watches afterwards, and they were exactly the same. The distance was a little over 600 yards. Cross-examined: Neither of the watches were stop watches. Mr. Miller submitted that it was no true test with ordinary watches. It might easily have been twelve o'clock when the defendant passed Salmon. The defendant gave evidence. He said he went by the Barton Road to Haslingfield, Harston, and back by Trumpington Road to Cambridge. His wife and two months' old child were with him. His wife asked him especially not to go quickly, as it would be bad for the child. He therefore went slowly. He should say it was quite impossible to go at twenty miles an hour with the motor he was driving. As far as he could judge of speed, he did not go at more than twelve miles an hour during any part of the drive. Witness saw Salmon in the middle of the village, speaking to someone under a tree. Witness nodded to him and he nodded back. Witness was a watchmaker by trade, and he gave it as his opinion that it was utterly impossible to time a 600 yards run with the watches produced by the two policemen. Mrs. Mortimer also said the car never went fast.

Defendant was fined £1 and 11s. 6d. costs. The chairman said the Bench had dealt leniently with the case, as it was one of the first.

At the Cambridge Divisional Police Court a few days ago Mr. Frederick Lawrence, cycle manufacturer, of Belmont Place, was summoned for driving a motor-cycle at a greater speed than twelve miles per hour, and pleaded not guilty. Mr. Miller defended. P.S. Warren said the defendant passed him twice, both times going at over twenty miles an hour. When witness saw him afterwards he admitted that he had been going at a high speed. P.C. Salmon also gave evidence. The defendant, in evidence, said he could not possibly have gone at twelve miles an hour, because the accumulators were giving out, and the engine kept on missing fire. A motor car always looked as if it was going faster than it was because it kicked up a lot of dust, the wheels being small and going round fast. At its best the machine he was riding on could not possibly go at more than sixteen miles an hour. Cuthbert William Banham, an electrical engineer of about ten years experience, said the accumulators were taken to him to be recharged. They were quite empty. While they were running down the motor could not have gone at more than ten miles an hour. Defendant was fined £1 and 11s. 6d. costs.

Wm. J. Crampton, electrical engineer, of Llandaff Chambers, Cambridge, was summoned for a similar offence at the same place and on the same date. Mr. Ellison appeared for the defendant, and expressed his regret for the offence, which, he said, was committed in ignorance. Defendant did not know he was breaking the law. He left himself in the hands of the Bench. Fined £1 and 8s. 6d. costs.

At Maidenhead, on Monday, Mr. D. M. Weigel, of Holland Park Avenue, London, was fined the maximum penalty of £10 and costs for having furiously driven a motor-cycle through Maidenhead streets on April 12. The Deputy Mayor (Mr. Wilton) was one of the witnesses, and he declared that the motor was travelling at the rate of twenty-five miles an hour. The toll-collector at Maidenhead Bridge said defendant threw out a halfpenny as he passed, when the proper toll was 6d.

MR. WALTER COLES was summoned at Hastings last week for not having a lighted lamp on a motor-car he was driving in Sedlescombe Road. Defendant said he had an accident, and it took him an hour to find a nut he lost. Fined 5s. and costs.

OUR Midland correspondent had a short run on an Allard "Rapid" car last week. The vehicle in question is of the light description to carry two persons; belt driven directly off the engine on to a countershaft, and from thence by means of a spur-gear on to a balance-gear axle. The engine is water-cooled, a pump and cooler being fitted, which enables the car to do a day's journey without recharging with water. The engine is of $3\frac{1}{2}$ h.p., the cylinder being $3\frac{1}{2}$ in. diameter by $3\frac{1}{2}$ in. stroke. The car is capable of climbing steep hills on the low gear, and can attain a speed of from eighteen to twenty miles an hour on the level on top speed.

A CLUB representing a federation of the various automobile clubs in Germany has been founded in Heidelberg. It is called the Alldeutscher Automobil-Club (All-German Automobile Club). There were present representatives of the Deutscher Automobil-Club, the Mitteleuropäischer Motorwagenverein, the Rheinischer Automobil-Club, the West-deutscher Automobil-Club, the Württembergischer Motorwagenverein, the Fränkischer Automobil-Club, and the Bayerischer Automobil-Club. It was agreed that all questions of general importance should be considered by a committee representing all the interests connected with the club. The Deutscher Automobile Club is to stand at the head of the new organisation, and have special charge of regulations for racing.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, MAY 19, 1900.

[No. 63.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WE learn that there is to be an automobile fête at the Crystal Palace this afternoon (Saturday), at which the public are to have an opportunity of taking drives in the vehicles which completed the 1,000-mile Trial. The drives will take place in the grounds of the Crystal Palace, and the money paid for tickets for seats will be devoted to Lady Georgina Curzon's Mafeking Relief Fund. Drives at 1s. per seat will commence at 3 o'clock and end at 4.30 p.m., while drives at 2s. 6d. per seat in the fast carriages belonging to the Hon. C. S. Rolls, Mr. Holder, Mr. Kennard, and others, will take place from 4.30 to 6.30 p.m.

The Liverpool Self-Propelled Traffic Association.

A CONFERENCE between the council of this association and the leading builders of motor-vehicles for heavy traffic was held at the Chamber of Commerce, Liverpool, on Monday. In the unavoidable absence of Mr. A. L. Jones, J.P., chairman of the council, the chair was taken by Mr. John A. Brodie, city engineer, senior vice-president, and there were also present Professor Hele-Shaw, F.R.S. (vice-president), Messrs. W. Becket Hill, Arthur Musker, Henry H. West, J. Walwyn White (hon. treasurer), and E. Shrapnell Smith (hon. secretary). The principal manufacturers attended. The object of the conference was to discuss the conditions for next year's trials, with particular reference to an arrangement by which the competing vehicles and additional ones of the most successful types shall be immediately available for road carrying operations between Liverpool and East Lancashire at the close of the competition. The conditions will be issued in the course of a few weeks. It was also decided to hold a meet and 50-mile run of members' private motor-carriages on Saturday, June 2.

Beastly Nuisances.

MR. JUSTICE BIGHAM is one of the latest judges, and in view of the support given to automobilism by the legal profession generally we need feel little concern at his antipathy to motor-vehicles. But it is a little surprising that he should have committed himself to a statement with reference to "gigantic motor carriages which cut up the roads and are a beastly nuisance." He had better confer with Sir Francis Jeune or Sir Richard Webster on the subject. The recent Trial has shown that motor-vehicles do far less damage to the roads than horse-drawn vehicles, and that there are thousands who would disagree as to the beastly nuisance.

Motor-Car Licences at Eastbourne.

THE following appeared in the minutes of the Eastbourne Watch Committee last week:—"The Committee again considered the application for renewal of motor-car licences, and it was resolved that the licences granted to Messrs. W. Jury and Sons (1), Sydney Easton (2), and H. E. Stredwick (2) be renewed,

provided that such cars shall not ply for hire on Sundays, or along the Parades (from the Redoubt to Holywell), Terminus Road, Paradise Drive, Duke's Drive, Meads Road (from the Town Hall to Fairfield Court), and Beachy Head Road; and that the speed of such cars when running within the Borough shall not exceed five miles per hour. It was further resolved that the Council be recommended to affix the Common Seal to such licences.

The Effect of Police Measures.

AMONG the numerous *chauffeurs* who made their appearance in the Paris courts last week, charged with furious driving, was a M. Page, one of the Décauville Company's mechanics, and the case was rendered of interest by reason of the information laid before the magistrate by M. Ravenez, who, as chairman of the Décauville Company, was civilly responsible for his employé. M. Ravenez dealt at length with the serious injury done to the trade by the stringent and aggressive measures recently adopted by the police, and emphasised his remarks by quoting from letters received from Germany, in which it was clearly demonstrated that over the frontier conductors intended to employ their best endeavours to secure the industry now so flourishing in France. He pointed out that whereas in 1898 the value of automobiles exported from France reached a value of but £16,000, in 1899 this had increased to £240,000, and that the Germans were not blind to the fact and intend to benefit as largely as possible by the recent turn of events in France. Should the persecution of automobilists continue, Germany would be enormously aided in her object, and M. Ravenez pointed out how in the case of his company, whose shops are close to the Porte Bineau, one of the favourite hunting grounds of the police, the clients were positively afraid to show themselves on their cars for fear of becoming the recipients of unjust and ridiculous summonses. M. Ravenez also appealed to the Commissioner of the Government to put a stop to the woeful lack of dignity now being displayed by the police, which reflects but little credit upon the force. The daily practice of some of these men is to lie in wait for passing cars, concealing themselves behind newspaper kiosques and omnibus stations, etc., and it is by no means edifying to see such proceedings. That M. Ravenez's pleading had its effect was evidenced by the more lenient tone adopted by the magistrates in dealing with the cases for the day, and in the majority of instances a fine merely was inflicted without the additional short term of imprisonment which of late has been so much in vogue.

The Improvement of our Roads.

A VERY useful paper on road construction was read at the Society of Arts last week by Mr. A. Moresby White, chairman of the Metropolitan District Association of the Cyclists' Touring Club. Although the subject was treated mainly from the cyclists' point of view, Mr. White gave elaborate and excellent rules for road construction, and urged that highway authorities should more generally utilise the ample powers conveyed by the Highway Act, 1864. The results of experiments with the tractometer were quoted to show the great saving in

labour of a good macadam surface. But Mr. White added that the ease of the traffic depends also in no small degree upon wheels, and thought it extraordinary that in these days of engineering triumphs we have not been supplied with a noiseless wheel. The author further suggested that a general standard of road repair should be established.

The Most Suitable Paving.

SOME interesting details regarding the paving of town roads are to be found in the report recently submitted to the City of London Corporation by Mr. D. J. Ross, the city engineer. This deals mainly with wood and asphalte and the comparative durability of these substances. Though the initial expense of such paving is heavy, the economy comes in not only in the length of time they last, but in the fact that important thoroughfares have not to be frequently closed to traffic for repairs. It may astonish many people to learn that the asphalte pavement on Holborn Viaduct, which is at present being renewed, for instance, has been down for seventeen years, in spite of 12,000 vehicles passing over it each day of twelve hours. In Lothbury the asphalte has not been renewed for twenty-three years, and in some of the minor streets for thirty years. The use of the hard Australian Jarrah wood does not appear to have been the success anticipated, though it has hardly yet had a fair trial.

The Carriage of Petrol on Railways.

A VERY important meeting was held at the Home Office on Friday last under the chairmanship of Captain J. H. Thomson, Her Majesty's Chief Inspector of Explosives, to go into the question of the carriage of petrol by railway companies, especially as bearing upon the point recently raised regarding the severe clause in the new consignment note of the railway companies. All the leading railway companies were represented, together with the manager of the Anglo-American Oil Company and Mr. Leonard, of Messrs. Carless, Capel, and Leonard, these gentlemen representing the petrol manufacturing industry; Major Holden, R.E., attended on behalf of the Automobile Club, while Mr. G. H. Smith, honorary secretary of the Motor Trades Association, represented that body. In the course of discussion it was allowed by the railway companies through their spokesman, that the objectionable clause of the consignment note was only intended by them to hold good in the event of their regulations as regards packing of the petrol not having been carried out. This of course makes the regulation a much less harsh and one-sided one. It was agreed that the manufacturers of petrol should submit samples of their packages to Captain Thomson, and that he should put them through a series of rough trials in the presence of the representatives of the railway companies, and if they came through the ordeal satisfactorily no doubt the railway companies would eventually agree to accept such packages, but it is understood that the result of the experiment shall not necessarily be binding on any party until their further consent is obtained. It was arranged that a specification of the approved vessels, whatever they may prove to be, should in future appear on the consignment note. It was understood from the railway companies that they desired to assist, so far as it was in their power, the motor trade. By this meeting the matter of the carriage of petrol had been advanced a distinct stage, and the Automobile Club, the Motor Trades Association, and the private individuals who have taken so much trouble in the matter, have evidently not laboured in vain.

A Magistrate's Opinion.

IN driving a little Pieper voiturette to the New Lyric Club the other day, Dr. Lehwess mistook the corner and drove to the off-side of the obelisk at the top of the Haymarket. He was pursued into the club by an irate policeman, who demanded his name and address. Being of a gentle nature he tried to soften Bobby's wrath with half-a-crown, which was scornfully

refused. A summons, of course, followed, and on Tuesday our *chouffeur* appeared before Mr. Denman at Marlborough Street Police Court. The "learned" magistrate, after hearing his explanation, growled out a bigoted "These things are bad enough even when on the right side of the road," and incontinently fined him 40s. and costs. Mr. Denman has doubtless caught Monsieur Lépine's malady.

Motor-Car Service for Aberdeen.

A NUMBER of gentlemen met in Aberdeen last week for the purpose of considering as to the establishment of a motor-car service in that city, and the result of their deliberations is the formation of a new company, to be called the Aberdeen District Motor-Car Service Company, Limited, with a capital of £5,000. About half of the required capital has been already subscribed, and the prospectus soliciting the remainder will be issued in the course of a few days. The directors of the company are Baillie Taggart (chairman), Shoremaster Robertson, Mr. A. J. Tulloch, and Mr. William Thomson, J.P. In addition to a service to Torry, the company propose to establish a service to the Bathing Station. The service to Torry would start from the foot of Market Street, and to the Bathing Station from the top of the street, while it is also intended to run cars to other districts of the town, where the directors consider there is a demand for a public conveyance. The company has concluded a contract with the Caledonian Motor-car and Cycle Company, Limited, for the immediate supply of four cars of the latest type, and it is expected that within a week or two the new service will be in operation. The cars, which will be built by the Daimler Motor Co., Ltd., will be of the wagonette type, with seating accommodation for nine persons, including the driver. With a similar object in view, the Aberdeen Motor-Car Company, Limited, has been formed, with a capital of £5,000. The formation of the company is the result of meetings and negotiations which recently took place following upon the defeat of the Town Council scheme to run a double line of tramways to Torry. The whole of the capital is, it is stated, assured. The company hope to start a service to Torry at once, but powers will be taken to extend operations to other localities where the directors consider a remunerative business may be carried on. Since the above was written, we are glad to learn that the last-named company, which had been formed for practically the same object, had agreed to withdraw, and the scheme will now be proceeded with to establish a service of cars to Torry, the Bathing Station, and other districts.

It is rumoured that the Automobile Club will hold their usual Whitsuntide tour. The destination is as yet uncertain, but the dates will, we believe, be from May 31st to June 5th.

MR. ALBERT C. BOSTWICK, chairman of the Runs, Tours, and Contests Committee of the Automobile Club of America, who is at present in Europe, is reported to have purchased M. René de Knyff's racing car for £2,400.

IN the Companies Winding-up Court last week, before Mr. Justice Wright, a petition was down for hearing for the winding up of the Beeston Motor Company, Limited. It was stated that negotiations were going on for a sale of the concern, and the petition was allowed to stand over for three weeks.

WE regret to learn of the death of Mr. William Erskine Bartlett, managing director of the North British Rubber Company, Limited, which took place at Bridge of Allan, on the 4th inst., at the age of seventy years. Mr. Bartlett, who was an American by birth, took over the management of the company at Edinburgh in 1868, and to his guidance and tact is the present position of the North British Rubber Company in a great measure due. More particularly was the deceased gentleman interested in that department of the business which related to the tires for cycles and vehicles known as the Clincher. After acting as manager for several years, Mr. Bartlett joined the directorate, and as managing director he supervised the rapidly increasing business of the company. He had been in failing health for the past few years.

The Automobile Club's 1,000-Mile Trial.

THE great 1,000-mile Trial is now an event of the past, the progress of the final stages of the tour being recorded in the following pages. The Trial, which represents some 50,000 miles of motor travel through crowded cities and dangerously hilly districts, was accomplished without accident to other users of the road being caused through want of control over, or bad driving of, an automobile. All the cars which went through the Trial travelled a minimum of 1,059½

miles, while some of them totalled 1,107½ miles. There were eleven actual running days since the competing vehicles left London on April 23, the balance being made up of Sundays and one-day exhibitions in the following towns:—Bristol, Birmingham, Manchester, Edinburgh, Newcastle, Leeds, and Sheffield. There were also temporary exhibitions on running days at Kendal, Carlisle, York, Lincoln, Nottingham, and Leicester. It should be added that on the off days a brief allowance only was made for cleaning and repairs, and that if a car required still more attention the time occupied was deducted from the next running day's journey. There were seven days out of the eleven on which a hundred miles or more was the distance travelled; the longest was the final journey of Saturday, and the shortest was the 61½ miles run from Kendal to Carlisle, which included a hill-climbing competition up Birkhill. The beneficial effects of the Trial are beyond measure. To the public it has revealed the fact that motor-cars are by no means toys, but are vehicles which can be relied upon to do their work efficiently; to the manufacturer it has revealed weak points which needed improvement and modification in a way that no isolated trips of 100 miles or so could possibly do. It has been said that many would-be purchasers of motor-cars have deferred making the plunge until the Trial was completed. Now that such a complete and trying test has been successfully negotiated by so large a number of motor-cars the step need no longer be delayed. It was at first

given what should prove an enormous impulse to the automobile movement.

ON THE LONG PILGRIMAGE.

By OBSERVER.

NOTTINGHAM, Friday night.

YESTERDAY was spent at Sheffield, and whatever may be thought of the town, or its hotels, there can be no two opinions as the hospitality of the Master Cutler and the inhabitants generally. The Automobile Club was right royally entertained, and pleasant are our memories of the great cutlery

THE BENZ IDEAL CAR (No. 2) DRIVEN BY MR. E. J. COLES.

town. The committee of gentlemen who became guarantors for the expenses of the visit of the vehicles to Sheffield showed a praiseworthy spirit; and Mr. J. T. Thompson, who filled the arduous post of hon. secretary so efficiently, worked very hard indeed for the success of the venture, sparing neither time nor money in the effort. Many other gentlemen also devoted much of their time to the affair, and it is only right to mention the names of Messrs. W. E. Cope, T. Lonsdale, Cooper Pearson, and F. B. Cauwood amongst those who volunteered for the tedious work in connection with the visit.

So far as the town itself was concerned, it was conceded by all that the tram lines must be the best laid in the whole kingdom—certainly far better laid than those of any other town through which we have passed. And seeing that we have travelled and slipped over many miles of lines we are well qualified to express an opinion. In many places the lines have been abominable—in fact, someone hazarded the opinion that they had been laid in the road and there left until the traffic had ground portions of them in just sufficiently to hold them in.

This morning the wind was cold and the "control" was long—six miles over tramlines. All the party were punctual, and those who had entered for the racing at Welbeck Abbey had to leave at 6.30 a.m. Even those least inclined to be early risers regretted the provision that kept them half-an-hour after the speedy ones had gone. A great deal of interest was taken in the departure of the vehicles, and all along the route to Woodhouse Mill Station a sympathetic crowd was seen. Near the control Mr. Frank Butler on his Panhard and Mrs. Kennard driving her De Dion voiturette went by. The succeeding portions of the road were of a switchback description, one steady incline culminating in a sharp rise that caused us to engage the assistance of a few onlookers in reaching the top. In the grey morning, and standing on the top of the hill, it was a

LORD KINGSBURGH AND COL. MAGRATH ON DAIMLER CAR No. 36.
Photo by] (Mr. Percy Richardson.

thought that the test was unnecessarily severe, but since it has been successfully carried through the Automobile Club and the motor industry generally can congratulate themselves on having

weird sight to see the town of Sheffield down in the hollow, with its tall chimney stacks belching forth volumes of smoke. During this part of the journey few cars were seen—in fact the only one that attracted attention was that of Mr. Holder, who was attending to the burners, and trying to remedy bad water circulation by the roadside.

We duly reached Worksop with the first of the Richard cars, and Mr. Mayhew's Peugeot, with Mr. A. Russell aboard and

then through a broad belt of oaks we went on at our own pace. Through the well-paved water splash some of the cars dashed with impetuous rush—and their riders had a shower bath. Others who had had experience—such as is given by the Kenilworth water splash—were wiser, and by driving slowly were able to go through drily. The roads through the park were in splendid condition, and towards the Normanton Lodge gates we met one of the stiffest hills of the whole tour. The arrangements for guiding drivers were excellent, and the permission of the Duke of Newcastle to put on full speed was taken advantage of by every car.

From the water splash at Clumber to Saxilby is a distance of fourteen miles—and very different is the scenery to that through the park. Instead of forest monarchs we saw nothing but a well-cultivated stretch of farm land, dotted with cottages and farm buildings, with here and there old square towers of churches and windmills saluting us lazily as we whizzed along. The Great North Road was crossed at Markham Moor Inn, and at East Markham we crossed the railway line before getting to the river Trent. There at Dunham toll bridge arrangements had been made that vehicles engaged in the Trial should pay no toll, the club having paid a certain sum to cover all tolls. Having convinced the somewhat sceptical gate-keeper that we were of the party, we went through—the Richard car, which had been travelling in fine style, coming up and going through with us. Dunham

presented a cheerful aspect with its groups of school children and labouring men waiting for the cars. Now we were on the last stretch to Lincoln, where, it was already evident, we should have a good reception. Many motor-vehicles had come out to meet us, and one funny little affair resembling a varnished box on wheels, and driven by an air-cooled motor, made us curious as to its capacity to travel. We had been going strong when suddenly, without a word

Haxton driving, behind. The streets of Worksop were well lined with spectators, an ambulance attracting considerable attention. At the outward control we were informed that three horses attached to a cart had run away at sight of a motor-car, and had thrown the driver, who was reported dead. That was ill news—the first of the kind heard during the Trial—and it was with something like relief that the true facts of the accident were ascertained at Lincoln. There we saw a member of the Automobile Club who had been to the hospital, whither the injured man had been taken. It appeared then that he had jumped from the cart and had received a nasty flesh wound. Fortunately it was not regarded as a serious one. As a rule there has been no difficulty in finding the breakfasting places in the towns—these being usually indicated by the police or by a break in the line of spectators—thus leading to the stable yard and hotel. But at Worksop there were no such indications, and we passed through the town to the outward control, thereby missing breakfast. Welbeck Abbey was immediately to the right, and strong was the temptation to go and see the speed trials, but we refrained. Following the instructions in the official programme, we turned to the left and made for Clumber Park. The weather had become bitterly cold, and all the sunshine had long disappeared. But the ride through Clumber Park was, perhaps, the most lovely part of the Trial; here the grass seemed more emerald than ever, and the newly-foliaged trees were simply delightful, elms full of leafage, lovely silver birches, chestnuts and maples thickly leaved and giving broad shadows, oaks and ash all growing to a beauty and height hardly to be rivalled anywhere. How Robin Hood and his merry men would have deplored the presence of so many motor-vehicles in the forest fastnesses! The motorists, however, were delighted with the country associated with so many of his famous exploits. The historic avenue of limes was traversed, and

of warning, our motor stopped dead. The Richard car, which had fallen slightly behind, passed and had got about a dozen yards ahead when it, too, stopped without notice. Nothing wrong could be found with our motor, and we started again after ascertaining that a plug on the Richard car had broken. Then we went straight into the

ancient cathedral city, where a large number of motor-vehicles were to be seen—principally of the Benz, Star, and Marshall types, the Daimler not being so well represented.

We were first into Lincoln and in good time, Mr. Siddeley's Parisian being second, followed by an Iveagh phaeton, the other cars following in quick succession. The first of the cars that had been engaged in the speed tests came in in a cold, drizzling rain.

At Lincoln the cars were on exhibition in St. Swithin's Square, the automobilists being entertained to luncheon by the mayor and the local committee at the Saracen's Head Hotel—an incident of the run that was greatly appreciated after the morning's trip. Then we started for Nottingham, the run being only broken by a halt at Newark for tea. Shortly after leaving Lincoln we noticed marks on the road which showed that some car, in taking a corner sharply, had slipped straight across the road and had managed to pull up at the edge of a ditch. The roads were rather dusty, but in good condition, and we were welcomed by long lines of people into Nottingham, a steep ascent from the Market Place leading to Starey's Repository in Parliament Street, where the cars were on exhibition in the evening. All seemed glad that the Trial was so

HOW THE LAST CAR CAME TO TOWN.

BY THE DESERTER.

WE live in an age of ever-hastening activity and unceasing rush. The motor-car is generally regarded as the embodiment in metal of this characteristic of the century—a monster that goes throbbing through quiet villages and snorting through busy streets with the impartiality of the plague, disturbing sylvan quietness and adding to urban noise. It has been known to go at a pace that no word of police

Photos by

[Mr. Percy Richardson.]

nearly at an end, and we were pleased to see that Mr. Pedley, who had been left behind ill at Birmingham, had turned up at Nottingham feeling much better.

THE SPEED TRIALS AT WELBECK.

BY permission of the Duke of Portland an optional speed test was participated in by fourteen competitors at Welbeck Abbey on Friday, the 11th.

The measured mile was a very gentle gradient, with two turns close together and a long straight stretch. Time-keepers were stationed at either end, and each car was sent off on the up-grade at intervals of half a minute. They waited at the opposite end until all the competitors had finished their first mile, then each was started at half-minute intervals on the down-grade, and when the times of each competitor for the double journey had been obtained the mean was taken, giving the following results:—

		Min.	Sec.
A 17	Hon. C. S. Rolls's 12 h.p. Panhard ...	1	35 1-5

authority could retard, and even in connection with the Great Trial, which was to test the vehicle and not record its speed, chronicles of a mile in four minutes have been told in private conversation. These things distress the easy-going man with a respect for law—and a wife and family. And when commissioned to go to Nottingham and faithfully describe the journey from that busy town, I felt ill at ease, for had I not been used to the familiar cabs and other creeping and crawling things? Mustering courage, and taking a railway ticket, I journeyed to the town from whence come lace curtains, determining to get there before the curs, and select a nice, quiet, steady, sober, and respectable motor-carriage on which to enter London in dignity and in a state of completeness. For those fast machines are monsters. Did not one shed a passenger, and another cause a sheep to flutter into muttiness? And are they not demoralising in making men believe that "things (*i.e.*, speeds) are not what they seem"?

Presently the cars arrived—in a style that would have been useful had they been going to a fire. But I was not concerned just then with futurity, and, as I have said, was on the look-out for a machine that was quiet on the road, easy in its internals, safe on its extremities, and not likely to exceed a jog-trot speed. I didn't object to jibbing—provided such antics did not take place

in market places and amidst assemblies of people. For there are ribald multitudes who seek to find amusement in the automobile that won't go at all, and wily policemen on the look-out for those that have learned the secret of accelerated motion. Three or four steady cars were pointed out—some had lost nuts, bolts, and minor accessories, and, although thus deformed, were useful. It is not always the spic and span that serves mankind. The old family cat, with eyes dim of sight and without a tooth, may yet scare the mice—though it cannot play the offensive among their ranks. And so with a motor-car. Parts may be out of truth and squint with irritating deviations from the straight, but the vehicle can get along with careful tending and gentle shoving uphill.

It was decided that I should go on a car that had done very well thus far. It had never been first; it had never been last. But it had been safe. Its number had never been taken by the police; its driver had never been warned within controls; it had never been taken up a lonely lane to be overhauled out of the sight of men. And yet it was sober and slow—just the car for one who is adverse to rapidly moving scenery, preferring to enjoy the beauty of Nature at a contemplative pace.

And yet don't imagine that there was no lack of enterprise either in the driver or the writer, for we got early to the control and started in the first dozen, going along Parliament Street and down the hill leading across the market in good style. One or two cars behind seemed rather close to our rear works, but none overtook us until we got near the Trent bridge, when the Hon. J. Scott Montagu's Daimler went ahead with Professor Vernon Boys and Mr. C. Cordingley aboard. A few minutes later the Richard car, No. 46, followed, and then we got to the outward control—leaving there eighteen minutes from the start.

The morning was not very bright, and as we got among the fields a nasty drizzling rain was making its influence felt in the greasy state of the road. That, however, did not interfere with the steady running of my car, and it certainly gave promise of what is known to automobilists as a good run. Meanwhile other vehicles were passing by. Mr. Egerton, on a De Dion voiturette, whizzed along in fine style; a few score yards along an International Victoria went ahead, and then a New Orleans car was succeeded by Mrs. Bazalgette on her Benz. There was a pleasing variety in the landscape and also in the cars that passed us. They certainly disturbed the continuity of the view, and were frequent enough to keep one's eyes to the road. Still, the ride was not without interest so far as the next few miles to Loughborough were concerned. No cars had lingered on the roadside, and all seemed anxious to go to the front—probably a reflection of the national idea just now. But why there should be such a rivalry I could not imagine, especially as I understood we were to show the authorities how much below the legal limit a motor-car can be safely driven. Even a huge Noah's-ark sort of car that was advertising the pen with which I write, after keeping doggedly by our side for some time, went ahead—it could stand it no longer. For, horrible to relate, the tire of our off front wheel had punctured, and we were hobbling along on three decent tires and one that was as flabby as an empty sandbag. After that all the small boys and other persons frequenting the road called attention to that punctured tire with a wearying reiteration that tried the patience of passenger and driver alike. They thought they were doing a kindly action in pointing to our misfortune, evidencing a sympathy that would win our appreciation; but their kindness became so monotonous and their sympathy became so tedious that one would have been glad of a pea-shooter for purposes of revenge. It is no joke to go along with so many sympathisers. They heeded not the quiet and sober dignity of our pace; the superior character of our car was unobserved. All they saw and all they seemed capable of understanding was our misfortune.

Still, we made headway—not so much up the hills as on the descent. But with the help of the Crypto gear we took the hills grandly. I got out to see how well the car advanced towards the heights, and coaxed it from the rear with both hands. The driver thought it would go without help, and I walked by its side with the contemplative attitude of the mute—once a feature of every funeral. Then from behind came the familiar "teuf, teuf," and I mounted the car again just

as we got to the top, and the New Orleans and Wolseley cars came along. Then we had quite a number of pace-makers—the Daimler public-service car, Mr. Mark Mayhew, Mr. R. E. Phillips on his "Petit Duc," and half a score of others. Somewhere in that district Mr. Swindley was seen on Mr. Lord's Peugeot, and he very considerably pointed to the wayward tire. In fact, scarcely a motorist did not express sympathy. We thank them all for their kind expressions; and can do so all the more heartily now that the trip is over. Nearer Loughborough M. Farman was descried on the roadside admiring a tire, and near Loughborough a 6 h.p. Iveagh phaeton was resting. I thought it was for the convenience of the journalists aboard, but afterwards discovered a pump had gone wrong. Happy No. 9—that was the end of its troubles; ours had scarcely begun. Just before getting to Leicester, M. Farman went along again, and with the baggage van, driven by Mr. Van Toll, before us, we went into Leicester in very satisfactory style—for us.

At Leicester I had a few minutes to inspect some of the cars that had recently passed us; but none of the earlier ones were to be seen, and a good time was spent in replacing the battered tire with a new one. It was merely a tack that had caused our difficulty.

Leaving Leicester we went capitally, passing over the tram lines with a nonchalance that had been impossible before. Right on through Oadby and Kibworth, we took the gradients with ease, and drew well away on the level. While we got ahead of none, none got ahead of us for a while, and then an International Victoria went by. A few miles further on Mr. R. E. Phillips was investigating his car, but caught up and passed us seven miles from Market Harborough.

In Market Harborough a new form of annoyance was commenced by the public, who would persist in asking if we were last. Once the query was varied, and "Are there any more?" was the form adopted, but the invariable question was, "Are you the last?" Captain Langrish was the only motorist we saw in the next few miles, until just after Maidwell Mr. Coles came to greet us, his car standing demurely enough in a blacksmith's shed. He seemed rejoiced—much in the manner of the sailors in "The Tempest," who thought each other drowned, and himself the only survivor. Mr. Coles had evidently fancied himself last, and was glad to give us a message for a friend at St. Albans—should we arrive first. A spindle had broken, but was quickly repaired, and his car was into Northampton a few minutes after our steady vehicle.

After the excellent run from Leicester to Market Harborough our car had been going rather slowly, but that did not distress me. Soon after leaving Mr. Coles we slowed down to a stationary position. A trail of water had led to the driver determining on an investigation of the car, when it was found a water joint had gone. Being at the rear of the straggling procession of vehicles—Mr. Rolls was in St. Albans by that time—the repair was made without observation. I became water carrier, surprising the good lady at the nearest farmhouse at the quantity of water required. She said the motor-car required more liquid than a horse. Only two motorists passed by—Mr. E. M. Iliffe on his motor-quadracycle, and a Decauville that gave notice of its coming and was speedy in its going. The water-joint skilfully repaired, we restarted. Evidently the rest had done us all good, and the engine seemed refreshed. We took the next hill in fine fashion on the top speed, and then, with encouraging smiles from the police and cheers from the children, we entered Northampton, nearly running over a bullock that crossed our path and alarming a dog that came too near.

When we got to Northampton few vestiges of a motor-car meet remained; and the Plough Inn was deserted. Mr. Banks was just about to depart on his Brown-Whitney steam car; the driver of the New Orleans was ruefully regarding a broken petrol pipe, a Decauville was being got ready for the start, and Mr. Moffatt Ford was preparing to take the M.C.C. Triumph on the last stage of this eventful journey. Thus we had the yard of the Plough Inn to ourselves—and determined to overhaul the car. On opening the back-door a crack in the bar on which the engine was supported revealed itself. "Good heavens!" said

the driver, in a tone that seemed serious indeed. Mr. Coles came along at that moment, and we saw how his repair had been effected. With the help of a local engineer the driver was able to make the necessary repair to our car; but when we got to the outward control no timekeepers could be seen. It was 5.30 p.m.

On through Horton, Stoke Goldington, and Newport Pagnell we went, a few cyclists hinting that the cars had gone by some hours before, and one or two of the facetious ones sadly wanting to know if there were any stray ones about. The evening grew cold, and our prospects of getting to St. Albans

PREPARING FOR THE RACE IN WELBECK PARK.

Photo by]

[Argent Archer, Kensington.

before the rest had got to the Crystal Palace were less. We maintained an even pace, such a steady-going rate as I had desired but had never before endured.

"O for a seat on a speedier car,
And a ride on one that would go!"

I don't mean that ours stopped—but it did not go like some are reported to have done. The twilight cast a dulness o'er the landscape, and at Woburn Sands—81 miles from Nottingham—I could stand it no longer. We were 40 miles from London, and I calculated the car would arrive there at midnight. There was, however, the risk of the delay, and, committing myself to the mercy of the railway company, I took train for Euston.

And thus I came to town. I have since learned the car reached London half an hour past midnight. Next time I go a-motoring give me a car that is speedy as well as sure.

HOMeward BOUND.

BY "PHANOMEN."

ALTHOUGH considerably interested in the progress of the 1,000-mile Trial, it is one thing to read of the same and another to actually take part in the tour, and when, during the course of last week, an invitation was extended to me to join the cars on the last day's run, there was no hesitation in my acceptance of the offer. Consequently, with great expectations, I journeyed down to the city of lace by the afternoon express on the Great Northern Railway on Friday last, and reached Nottingham just in time to see a number of cars finishing up their day's journey. So far, I was in anxious ignorance of the particular car which was to convey me back to town, so, after attending to the wants of the inner man, I quickly repaired to the Repository, where the evening exhibition of the competing vehicles was being held, to learn my fate. Many times on the way down by train I had cogitated whether I should be dropped on one of the fast cars, or a reliable steady-going car, guaranteed to do its average of twelve miles an hour and no more, or one of those lazier vehicles, whose daily records had been of a somewhat varied character.

Hardly had I entered the Repository when I was greeted

by Mr. Percy Richardson, of the Daimler Motor Company, Limited, and duly informed by him that he had reserved a seat for me in his wagonette, No. 36. "Phanomen," said I to myself, "your luck's in," for I have had many previous rides with Mr. Richardson, and know from experience that he always brings his passengers home safely and in good time. My anxiety thus relieved, I spent a pleasant hour in chatting with many of those who had gone through the Trial, and whom I had not seen since the start from Hyde Park Corner, nearly three weeks before. Having had strict instructions not to be late, and acting on a revised version of an old saw, "Early to bed, early to control," I retired to rest and dream of the events of the morrow.

Reaching the Repository at 6.15 a.m. on Saturday morning I found a very lively state of affairs already prevailing—several filling up with petrol, others with water, others lighting up their burners, and others vainly endeavouring to work their way out from the rear to get to the control early. By 6.30 nearly all the motors were in operation, and the noise of so many engines at work under one roof made the Repository more like a large engineering establishment rather than a stable for horses and vehicles. Our party, which consisted of Lord Kingsburgh, Colonel Magrath, and self, with Mr. Richardson at the wheel, were quickly on board, and running up to the control found already six or seven vehicles in front of us. Although seven o'clock was the official time of starting, in view of the long day's journey—over 120 miles—the signal was given as soon as the bulk of the cars were ready to start, we on No. 36 being timed out at 6.57 a.m. Notwithstanding the early hour a fair number of people turned out to see us depart. The Trent bridge crossed, we quickly arrived at the outward control, and then the open country was reached. There was rather a sharp nip in the air, and the gathering of the clouds overhead did not promise a very enjoyable trip so far as the elements were concerned. Expectations in this direction were not disappointed, for ere long the rain began to come down heavily, and made us glad that we

THE CARS LEAVING LINCOLN.

Photo by]

[Argent Archer, Kensington.

had brought with us a mackintosh in addition to a heavy overcoat. Pointing to a road over the hill-tops some miles distant, we were duly informed that we would shortly have to climb that. It proved to be Bunny Hill, one of the steepest in the district. Expecting, no doubt, to see a little fun, quite a number of local automobilists had journeyed to this point—there being five or six cars on the roadside—to see the way the competing vehicles mounted or were pushed up the stiff gradient. So far as we were concerned no pushing was necessary, although the three passengers were politely requested to dismount. The top of Bunny Hill reached, we all quickly made ourselves comfortable again, and were soon travelling at a fair pace. Near Costock,

No. 9 was seen at the roadside, the driver devoting his attention to the motor. In due course Loughborough was reached, and by this time the rain had temporarily ceased. The cars as they passed through the town met with a hearty reception, it being the hour when a good many workmen were wending their way to the several large engineering works in the neighbourhood. Mount Sorrel, which, from what we saw of it, is principally noted for the strange colour of the corduroy trousers worn by the men employed in the quarries close by, was next passed, and the miles to Leicester shown by the mile-stones steadily diminished. About five miles from the latter town Messrs. Egerton and Grierson were seen busy at work on the motor of their De Dion voiturette, No. 15, the trouble being, as we afterwards learned, with the exhaust box. A few miles from Leicester we were passed by several cars, including the Wolseley voiturette, Mr. Siddeley's Parisian Daimler, and Mr. Mayhew's Peugeot, and for the first time for many miles we had a sight of the running of a number of vehicles in front of us. In due time the inward control at Leicester was reached, where we gathered that a dozen cars had arrived before

miles from Market Harborough urging us to go quicker! A few miles further on we came upon Mr. Friswell, enjoying himself on his back under his 8-h.p. Peugeot, trouble with the pump being the cause of his stoppage. Near Kibworth, Mr. Critchley, on his khaki-coloured Parisian Daimler, gave us the go-by, as also did the Gladiator voiturette; both cars were going at a good pace, and the way the last-named vehicle tackled the hills was much commented on. On the outskirts of Market Harborough the male inmates of the workhouse had lined up to witness the passage of the cars, and as we went by there was a good deal of head-nodding at one another, the poor old fellows no doubt talking of the changes that have come over locomotion since they were boys.

This section of the route proved one of the most trying of the whole journey, for it was made up of a series of steep rises and falls, and, as the rain had now begun to be heavy, the roads were too greasy to permit of full advantage being taken of the down grades. For some time now we had been speeding on our way alone, not another car being in sight, either in the front or at

THE OUTWARD CONTROL AT LEICESTER.

(Mr. Per y Richardson.

us. Probably owing to the inclement weather there were relatively few people out to greet us. The order to travel through the town at a speed of four miles per hour was given at the Great Northern Railway Station, and at this speed we ran into the yard of the Bell Hotel, in Humberstone Gate, where the vehicles had to stay one hour for exhibition purposes.

Breakfast partaken of, a restart for Northampton was made in due course, the cars being held up at the outward control until the appointed time. Several of the Leicester Motor-car Company's Daimler covered wagonettes were observed at work in the public service as we passed out of the town into the suburbs. A mile or so further on we came across Mr. F. H. Butler's car with a punctured tire, which caused him an hour's delay, while not far away Mr. Mark Mayhew was devoting attention to his Panhard car on the roadside. Nothing very exciting occurred to us for some miles until we came upon a herd of cows, which the man in charge left to themselves. However, with but little difficulty we got through, and once more had a clear road, a policeman at a village about nine

the rear; but near Maidwell Mr. S. Farman, on the M.C.C. Triumph No. 32, came along at a good pace and passed us, as also did Mr. Stocks on the Ariel quad No. 3, and Mr. Jackson on the Century tandem tricycle No. 39. By the way, I noticed that this machine was fitted with a 3-h.p. water-cooled De Dion motor and radiator, not a 2½-h.p. motor as specified in the red book. Near Lamport a very steep descent was met; this we negotiated at a speed which brought the tears into one's eyes. Once more on the level and turning a bend in the road we found the gates at the level crossing at Lamport Station closed against us. This brought us to a stop—the first since leaving Leicester—while a slow coal train went by. At all the cross-roads we encountered groups of interested spectators, and from the number of smart turn-outs of dog-carts, etc., it was evident that the local gentry were taking advantage of the opportunity of seeing for themselves the progress that has been made in motor-cars. We were also pleased to see a couple of ladies on horseback ride behind us for a little distance, thus giving their horses a useful lesson in running quietly in company with automobiles. The red book,

which was a most complete encyclopædia, warned us to beware of the village of Brixworth with its sharp turns. What with these turns and the narrowness of the road at this point many a driver on Saturday was put on his mettle in the handling of his car. We got through safely, however, and were soon running along at a good bat—indeed, the nearer our car got to London the better did the motor seem to pull. In fact, as Lord Kingsburgh remarked, it must have known it was going home for a well-earned rest. A few miles further on we overtook the

CAR No. 36.—THE DAIMLER WAGONETTE ARRIVING AT THE ST. ALBANS OUTWARD CONTROL.
[E. Seamell, Crouch Hill.]

Gladiator voiturette, stopped on the road side, and then M. Jules Dubois on the Decauville No. 34 gave us a taste of his exhaust, and also a demonstration of his agility in jumping off and running along with his little car up the hills. Enjoying a delightful down-hill run we were soon at the Northampton control and on our way to the halting place for lunch. Right in the town we witnessed the nearest approach to a nasty accident on the whole journey. A number of little boys, not content with viewing the cars from the pavement, had placed themselves on the road. A horse attached to a brougham suddenly became restive, and to all the onlookers it appeared that there was no escape for two of the boys whose attention was all for the motor-cars in front of them. Fortunately the driver of the brougham managed to pull his horse a little to the side, but it was a miraculous escape. Running almost to the other end of the town, we found that most of the cars had turned into Messrs. Mulliner's carriage building establishment, so, following suit, we were quickly enjoying a well-earned lunch.

An hour later we started on our last stage of the journey, so far as time records were concerned, viz., to St. Albans, a distance of 44½ miles. We had not gone very far when we came across the Century tandem-tricycle hung up with a punctured tire. At Horton Mr. Friswell came along and left us, while at Stoke Goldington the Century once more passed at a good pace, the riders having effected a quick change of tires. Newport Pagnell was the next town to be passed, and here the sharp turn was safely negotiated, the police rendering assistance in directing the way and keeping the road clear. A mile or so further on the Hon. J. Scott Montagu's car, with Professor Vernon Boys and Mr. C. Cordingley aboard, came along and passed us, while near Waverden we left Mr. Friswell behind us, his pump again giving him trouble. Just before reaching Hockliffe we had to slow down for a flock of sheep which blocked our way. The animals did not apparently like the "teuf teuf" of the motor, for they stamped along in front of us at a tremendous pace, one making a somersault on the way. Dunstable had made itself quite gay with bunting to welcome the motor-cars, and the populace were

loud in their cheering as we passed along the High Street. A similar reception was accorded us as we ran through Markyate Street and Redbourn, and we quickly found ourselves at the inward control at St. Albans, the timekeepers informing us that we were the seventeenth in order of arrival. Quite a large crowd gathered at the ancient city, who had a good opportunity of inspecting the cars, the order having gone forth in the morning that the vehicles that had arrived up to that time would line up and start in procession at 5 p.m. for London, no passing to take place on the way. Finding the Pea Hen Hotel yard full up, we wended our way to the Queen's Hotel, and, following the example set by earlier arrivals, filled up the time at our disposal by having tea.

At the outward control at St. Albans a lively scene presented itself. The road being somewhat narrow a little difficulty was experienced in lining up the cars in the same order as that in which they arrived at the inward control. This over, however, a good deal of posing took place for the photographs, and punctually at 5 p.m. the procession, consisting of about thirty vehicles, and headed by the Hon. C. S. Rolls' Panhard, set out for London. Apparently the rain had not been so heavy as further north, the roads being dusty, and those unprovided with goggles had a very trying time. The procession had hardly started when it was brought to a stand, by a restive hay-motor, which did not like passing so many petrol motors at such close quarters as was necessitated by the narrowness of the road at that point. However, the horse was persuaded to behave itself, and we moved along once more. All along the route a large crowd of spectators was met, the number increasing the nearer we got to London, while from St. Albans onwards quite a number of automobilists came out on their cars to welcome us home. Near Elstree Mr. Holder's twin-Daimler was passed, apparently having tire troubles, while at the Welsh Harp the Gladiator voiturette dropped out of the procession. Cricklewood, Kilburn, Maida Vale—it is time the wood paving was repaired here—were soon all behind us, and looking something between a miller and a collier, owing to the dusty twenty miles run from St. Albans, we turned into Oxford Street at the Marble Arch. Along Regent Street, Pall Mall, Charing Cross, Northumberland Avenue we went, and in a few minutes found ourselves outside the Automobile Club's headquarters at 6.43 p.m., fourteen cars being lined up in front of us.

THE PROCESSION LEAVING ST. ALBANS.—THE HON. J. SCOTT MONTAGU'S DAIMLER CAR AND THE WOLSELEY VOITURETTE.
[E. Seamell, Crouch Hill.]

As I said at the beginning, I knew my luck was in when I learned I was to be in the care of Mr. Richardson. His Daimler car, No. 36, ran beautifully the whole distance of 124 miles, with not a single stop except at the appointed places, and the run, but for the heavy rain in the earlier part of the day and

the dust at the finish, was most enjoyable, and will long be remembered by the writer.

EN ROUTE.

LINCOLN.

The visit of the motorists to Lincoln was well timed, and, while the residents were particularly interested in the arrival, both they and the country visitors joined in lining the streets to see the grand departure. The arrival was piecemeal, so to speak, and the car which attracted the most interest, that of the Hon. C. S. Rolls, was one of the last to enter St. Swithin's Square, having been engaged in a time contest in the Dukeries, which it won handsomely. All the way through Lincoln the High Street was crowded, and in Bracebridge the juvenile element was particularly demonstrative. Along the pretty road to Newark knots of people were passed almost every hundred yards, and Newark was found waiting in the streets, practically in a body.

NOTTINGHAM.

The first motor-car arrived shortly after six o'clock, and the vehicles continued to enter by Trent Bridge in pretty rapid succession for the next hour and a half. During the evening the exhibition of the cars at Starey's Repository was well attended. The following is a complete list of the cars in the building at 9.30 p.m. on the 11th inst. :—

PRIVATE OWNERS' CLASS.

A 10	8 h.p.	Napier	Mr. E. Kennard
A 17	12 h.p.	Panhard	Hon. C. S. Rolls
A 2	6 h.p.	Panhard	Mr. F. H. Butler
A 22	12 h.p.	Daimler	Mr. J. A. Holder
A 4	8 h.p.	Panhard	Mr. Mark Mayhew
A 11	12 h.p.	Daimler	Hon. J. Scott Montague, M.P.
A 29	7 h.p.	Peugeot	Mr. Mark Mayhew
A 30	6 h.p.	Daimler Parisian	Mr. J. D. Siddeley
A 26	6 h.p.	Daimler phaeton	Mr. C. Gregson
A 20	2½ h.p.	Empress motor tricycle	Mr. Herbert Ashby
A 31	6 h.p.	Daimler Parisian	Mr. W. E. E.
A 7	6 h.p.	Daimler Parisian	Mr. Alfred Harmsworth
A 23	6½ h.p.	Phaeton	Mr. C. Cordingley
A 12	6 h.p.	Daimler	Mr. Henry Edmunds
A 25	3 h.p.	Benz Ideal	Mrs. Bazalgette
A 21	6 h.p.	Daimler	Mr. Ernest Pitman
A 28	2 h.p.	Enfield quadricycle	Mr. E. M. Iliffe
A 24	4 h.p.	Mors "Petit Duc"	Mr. Robert E. Phillips
A 3	6 h.p.	Panhard	Mr. T. B. Browne
A 13	6 h.p.	Daimler	Mr. E. Estcourt
A 27	12 h.p.	Daimler	Mr. J. R. Hargreaves

AGENTS' AND MANUFACTURERS' CLASS.

No. 4	2½ h.p.	Ariel tricycle, with trailer
26	8 h.p.	Peugeot
3	3½ h.p.	Ariel quadricycle
37	6 h.p.	Daimler Parisian
39	3 h.p.	Century Tandem tricycle
35	6 h.p.	Daimler
46	7 h.p.	Richard car
34	3½ h.p.	Decauville
1	3 h.p.	Benz Ideal
16	3½ h.p.	Gladiator voiturette,
40	3 h.p.	Wolseley voiturette
27	3 h.p.	New Orleans car
47	7 h.p.	Richard car
8	6 h.p.	Motor Manufacturing Company's Phaeton
31	3½ h.p.	M.C.C. Triumph
32	3½ h.p.	M.C.C. Triumph
2	3 h.p.	Benz Ideal
36	6 h.p.	Daimler
15	3 h.p.	De Dion voiturette
44	3 h.p.	International Victoria
49	5 h.p.	Marshall
51	3½ h.p.	Star voiturette
14	3 h.p.	De Dion voiturette
28	3 h.p.	New Orleans car
41	3 h.p.	International Victoria
33	3½ h.p.	Decauville
12	2½ h.p.	Motor Manufacturing Company's tricycle
24	5 h.p.	Marshall
38	9½ h.p.	Daimler public service vehicle
5	5½ h.p.	Locomobile steam carriage
22	8 h.p.	Lanchester carriage
29	2½ h.p.	Eureka

On Saturday morning, rain and rawness of the morning combined to give a feeling of depression at the start. There was

a fair number of spectators in Parliament Street, and many going to work stopped to look at the cars as they progressed along Market Street, Wheeler Gate, Albert Street, Lister Gate, Carrington Street, and Arkwright Street, to the Loughborough Road, making the first halt at the confines of West Bridgford. It was half-past seven before the last cars got away, and two belonging to Mr. Hargreaves did not start for London, going to Coventry instead.

LOUGHBOROUGH.

Much interest was shown in the passage through Loughborough. The first car to arrive was the 12 h.p. Panhard, driven by its owner, the Hon. C. S. Rolls. Two minutes later came Mr. Edward Kennard's 8 h.p. Napier, followed in another minute by a 12 h.p. Daimler, driven by Mr. J. S. Holder. From then the cars came through the town at intervals of one a minute or two till about 8.20, when forty-four had passed. Seven more came along after that time, the last being timed at about 9.30. The "inward control" for Loughborough was at the Great Central Railway Bridge on the Nottingham Road, from which point a speed limit of eight miles an hour was imposed through the town by way of Nottingham Road, Sparrow Hill, Pinfold Gate, and Leicester Road to the "outward control" at the Grammar School gates. There the signal was "right away" for Leicester. At the inward control Mr. A. H. Walker, and at the outward Mr. R. S. Clifford, junior, recorded the times of the passing of each car. A large number of people turned out along the route to watch the procession. For nearly half an hour we had experienced a heavy fall of rain and sleet, which had made the roads somewhat sticky, and the way the cars were handled came in for much commendation, regret being evinced that a stop was not made here to allow of a closer acquaintance being made with the vehicles. The police gave much assistance in regulating the traffic and directing the voyagers on their way.

NORTHAMPTON.

The arrangements for the reception of the vehicles at Northampton were made by Mr. A. F. Mulliner, of Bridge Street, who is a member of the Automobile Club, and is also largely interested in the building of motor-car bodies. The inward control to Northampton Mr. Mulliner arranged to take place at the open space at Kingsthorpe, where the mile-stone to the town stands, and at this control the inward time of each car was taken by Mr. H. W. Dover and Mr. W. B. Shepard. This being done, the cars proceeded at a comparatively slow speed along the Barrack Road, Sheep Street, the Drapery, and down Bridge Street. Several of the cars were cleverly turned into the capacious premises of Mr. A. F. Mulliner, and others were arranged to be placed in the Plough Inn yard. Mr. Mulliner gave a luncheon to a number of members and friends of the Automobile Club. Only a short time was allowed for lunch, as the cars were supposed to leave within an hour after being timed at Kingsthorpe. During the interval several in charge of the cars took advantage to make a thorough overhauling before proceeding on the remainder of their journey. Mr. J. Porteous and Mr. Spencer Downing, both of whom are well known in connection with sport and racing, lent valuable assistance in carrying out the necessary arrangements for the reception of the tourists. The first car to arrive was that of the Hon. C. S. Rolls, Mr. Edge being second. Then came Messrs. Cheel and Newton and Mr. T. A. Holder. Among the later arrivals was the Brown-Whitney steam car and a Marshall car, which required assistance from a local engineer before proceeding on its journey, leaving Northampton about 5.30 p.m. The cars left in the same order that they had entered the town, Messrs. G. H. Bennett and L. Sharman being at the outward control.

DUNSTABLE.

What with a brass band contest and the passage through the town of the motor-cars, Dunstable was quite gay on Saturday. The first passed through early in the afternoon, and for over two hours afterwards vehicles came along at irregular intervals, while a few stragglers were seen even later. There

was a great crowd, and the railway had brought many from neighbouring places to see the motor-vehicles.

ST. ALBANS.

When it became known that the finish of the Trial, so far as time records were concerned, would take place in our town, and that the vehicles which had arrived up to 5 p.m. would then start in procession for London, a large crowd quickly gathered. The first car arrived early in the afternoon, followed quickly by over thirty others. The yard of the Pea Hen Hotel was rapidly filled up, some of the vehicles finding a temporary resting-place at the Queen's and others at the Bell Hotel. The procession was formed up near St. Stephen's Church in a somewhat narrow part of the road, and here about thirty vehicles set off in a group for London.

LONDON.

Report had it that the first car would not reach the Club before 7 p.m., but an hour in advance of that time several well-known members of the automobile world put in an appearance to welcome the 1,000-milers home after their long and trying journey. The cry "Here they come!" went up when, shortly after 6.30 p.m., the "toot, toot" of a horn was heard, and the

- 31 M.C.C. Triumph (Mr. S. Farman)
- 3 Ariel quadricycle (Mr. Stocks)
- A 11 Hon. J. Scott's 12 h.p. Daimler
- 40 Wolseley voiturette (Mr. Austin)
- A 20 Mr. Ashby's Empress motor tricycle
- 35 Daimler Parisian (Mr. Critchley)
- 34 Decauville voiturette (M. Dubois)
- 33 Daimler wagonette (Mr. Richardson)
- 26 8 h.p. Peugeot (Mr. Friswell)
- 47 Richard car
- A 3 Mr. T. B. Browne's 6 h.p. Panhard
- A 2 Mr. F. H. Butler's 6 h.p. Panhard
- 15 De Dion Voiturette
- A 21 Mr. E. Pitman's 6 h.p. Daimler
- 11 Motor Manufacturing Company's Princess car
- 27 New Orleans car
- A 31 Mr. Exe's Parisian Daimler
- 9 Motor Manufacturing Company's Iveagh phaeton
- 49 Marshall car (Mr. Mann)
- A 4 Mr. M. Mayhew's 8 h.p. Panhard
- 37 Daimler Parisian (Mr. Pedley)
- A 22 Mr. J. A. Holder's 12 h.p. Daimler
- 51 Star voiturette (Mr. Lisle)
- 1 Benz Ideal (Mr. Hewetson)
- A 25 Mrs. Bazalgette's Benz

[Argent Archer, Kensington.]

procession, headed by the Hon. C. S. Rolls, on his 12 h.p. Panhard, came in sight. The shaking of hands, the passing of congratulations, and the presentation of handsome bouquets of flowers by Mr. F. R. Simms to the ladies of the party who had completed the 1,000 miles, occupied the next few minutes, after which some little time was spent in posing for the various photographers anxious to get a snapshot of the finish. This operation over, the vehicles and their occupants began quietly to disperse—some going to the Crystal Palace and some home, the latter preferring to leave the final journey until the morrow. The thirty-three cars which were lined up at the finish at the Horse Guards Avenue at 7 p.m. on Saturday are shown below in the order of arrival. During the evening a number of other cars came in, the total number which reached the Club on Saturday night, according to the official record, being forty-seven.

- A 17 Hon. C. S. Rolls's 12 h.p. Panhard
- A 10 Mr. Kennard's 8 h.p. Napier (Mr. S. F. Edge)
- 4 Ariel tricycle and Whippet trailer
- 46 Richard car
- A 29 Mr. Iliffe's Enfield quadricycle
- A 30 Mr. Siddoley's Parisian Daimler
- 39 Century tandem tricycle (Mr. Jackson)

THE EXHIBITION AT SHEFFIELD.

THE exhibition at Sheffield was held in the Artillery Drill Hall, a building admirably adapted for the purpose, on Thursday, the 10th inst.

The opening ceremony was presided over by Mr. E. P. Reynolds (chairman of the Sheffield committee), and among others present were the Master Cutler (Mr. R. A. Hadfield), the Earl of Wharnccliffe, the Lord Justice Clerk of Scotland, the Hon. John Scott Montagu, M.P., Sir William Leng, Mr. C. D. Leng, Mr. W. St. Q. Leng, Mr. R. Jack, Mr. G. E. Branson, Mr. T. S. Ellin, Mr. G. Howson, Mr. Harry Huntsman, Mr. and Mrs. Talbot, Mr. and Mrs. Duncan Gilmour, Mr. R. H. Dunbar, Mr. John Dery, Mr. J. F. Smith, Mr. J. T. Thompson (secretary), and a number of members of the local committee.

The Master Cutler, in declaring the exhibition open, said it was with great pleasure that they welcomed the representatives of the Automobile Club to Sheffield. The object of the tour was a very important one, as it was to familiarise people with the real object of automobilists, and to remove

prejudices. They might depend upon it that before long automobilism would be in a very advanced position; and he congratulated those who were bringing this development forward on doing a good work. He saw very few objections to automobilism, but one thing he hoped was that the motor industry would not suffer from over-capitalisation, but would be carried on on honest, sound business lines. Just as the introduction of gas, electricity, and railways was delayed by prejudice, so this new manufacture might be delayed, but the advantages of automobilism were so many that he thought all prejudices would be overcome. He referred to the splendid performances of Mr. Rolls' car, and said that, although it was French built, people in Sheffield would congratulate the manufacturers upon their success. They were setting an example which he was sure Britishers would before long try to beat, and that was the only kind of fight that we wanted between the two nations. He next spoke of the adaptability of automobilism to warfare, and also said he believed the manufacture of the vehicles would bring trade to Sheffield, which would always be ready to supply the material required.

The Hon. J. S. Montagu, M.P., on behalf of the Automobile Club, returned thanks for the welcome.

Subsequently the Master Cutler and members of the local committee entertained the members of the club to luncheon. The Master Cutler presided.

After the loyal toasts,

The chairman proposed "The Visitors and Success to Automobilism." He complimented Mr. E. P. Reynolds on having done much to introduce automobilism into Sheffield, and was glad that the car he rode was entirely of British construction, and that the body was produced by a Sheffield carriage maker. The Napier car was doing good work, and for practical work, such as hauling loads, the British cars were coming out a long way ahead of their rivals. As representing the industries of that great city, he was delighted to see so many of those who were helping to introduce what he believed would be an enormous industry in the future. The manufacture of automobiles, he expected, would progress in the same way as the manufacture of cycles had progressed during the last ten or twelve years. Acknowledging the presence at the table of some French automobilists, Mr. Hadfield paid compliments to the manufacturers of France on their splendid enterprise in taking up the automobile movement, but at the same time he expressed the hope that before long we in England would not need to go to our neighbours on the Continent either to learn how to build motor-cars or how to appreciate their advantages.

The Lord Justice Clerk of Scotland responded in a humorous speech. He remembered the early days of the first successes of railways in this country, and could recollect incidents very similar to incidents which were happening now, and he believed that if moderation was practised automobilism would soon be looked upon as being as much a matter of course as railway travelling. Nowhere did automobilism receive such a welcome as in the villages, from old people, who remembered the early days of railways, and, knowing how the predictions with regard to their dangers were falsified, had open minds on the subject of new means of travelling. He remarked that Sheffield was one of the places which petitioned in the early days against a railway which would come within ten miles. As to the cars which had fallen behind in the Trial, he divided them into three classes: those belonging to amateurs, who were dissatisfied with the speed attained; those which suffered from broken axles or wheels, through no fault of the art of automobilism, but because the coach builder and the engineer had not yet been got to work together; and those which had actually broken down through the motive machinery being in an unsatisfactory condition, which was not to the credit of automobilism. If they got through the trip without doing serious injury to any human being, it would be a great thing in favour of automobilism. Horses soon grew accustomed to the cars, and he believed that the future of the autocar was not limited to sport, but it would provide a highly economical mode of land transport, and also of military transport, such as the world had never seen.

The Earl of Wharnccliffe, who also responded, alluded to the usefulness of motor-cars to doctors, who were liable to be called

up hurriedly in the night. If the stories he had heard as to the speed of the riders on the previous day were true, he was afraid he would have the pleasure of meeting some of them at Barnsley next Wednesday, but he had no doubt the West Riding police had exercised an amiable discretion in the matter. The exhibition had given a good deal of pleasure and instruction to the visitors.

The Hon. J. Scott Montagu, M.P., proposed "The Press," to which Mr. R. H. Dunbar and Mr. J. Derry responded, the former saying that the Press wished the movement all the success it deserved, and that the members of the club were pioneers in what would be a remarkable accession to the pleasure, the comfort, the convenience, and the business facilities of a great nation.

Mr. Mark Mayhew, L.C.C., proposed "The Chairman and the Local Committee," to which the Master Cutler, Mr. E. P. Reynolds, and Mr. J. T. Thompson responded.

The attendance at the exhibition during the day was very satisfactory. If there is any balance of profit it will be handed over to the Lord Mayor's War Fund. During the afternoon many of the visitors, on the invitation of the Master Cutler, inspected the works of Hadfields, Limited. The Earl of Wharnccliffe enjoyed a ride through the city on one of the motor-cars. In addition to the forty-seven vehicles turned in at the Drill Hall on Wednesday afternoon, several others arrived at a later hour.

THE EXHIBITION AT THE CRYSTAL PALACE.

ALTHOUGH the Prince's Skating Club was first of all suggested as the *locale* for the exhibition of the competing cars on their return from the 1,000-Mile Trial, the Crystal Palace was eventually decided upon, and instructions were issued that the vehicles could be taken thither either on Saturday night or before 1 p.m. on Sunday last. About a dozen of the cars were driven there immediately after reaching the Club on Saturday, but the bulk did not arrive at the Palace until Sunday, forty-six cars being counted at the appointed time on that day. Several others put in an appearance later, the appended list showing the fifty cars which were in position in the cemented portion of the main building at 5 p.m. on Monday last.

- A 2 Mr. F. H. Butler's 6 h.p. Panhard
- A 3 Mr. T. B. Browne's 6 h.p. Panhard
- A 4 Mr. M. Mayhew's 8 h.p. Panhard
- A 10 Mr. E. Kennard's 8 h.p. Napier
- A 11 The Hon. J. Scott Montagu's 12 h.p. Daimler
- A 12 Mr. H. Edmunds' 6 h.p. Daimler
- A 17 The Hon. C. S. Rolls' 12 h.p. Panhard
- A 20 Mr. H. Ashby's Empress tricycle
- A 21 Mr. E. Pitman's 6 h.p. Daimler
- A 22 Mr. J. A. Holder's 12 h.p. Daimler
- A 23 Mr. C. Cordingley's 6½ h.p. M.M.C. phaeton
- A 24 Mr. R. E. Phillips's Mors Petit Duc
- A 25 Mrs. Bazalgette's Benz Ideal
- A 26 Mr. C. K. Gregson's 6 h.p. Daimler
- A 28 Mr. E. M. Hiffe's Enfield quadricycle
- A 29 Mr. M. Mayhew's 7 h.p. Peugeot
- A 30 Mr. J. D. Siddeley's Parisian Daimler
- A 31 Mr. W. Exe's Parisian Daimler
- 1 Hewetson's Benz Ideal
- 2 Benz Ideal, 1900 pattern
- 3 Ariel quadricycle
- 4 Ariel tricycle and Whippet trailer
- 5 Locomobile steam car
- 8 Motor Manufacturing Company's 6 h.p. phaeton

- 28 New Orleans car
- 31 M.C.C. Triumph voiturette
- 32 M.C.C. Triumph voiturette
- 33 Decauville voiturette
- 34 Decauville voiturette

- 36 Daimler wagonette
- 37 Daimler Parisian
- 38 Daimler Public Service car
- 39 Century tandem tricycle
- 40 Wolseley voiturette
- 41 International victoria
- 44 International victoria
- 45 S.S. car
- 46 Richard car
- 47 Richard car
- 49 Marshall car
- 51 Star voiturette.

At the time we visited the exhibition the bulk of the cars had been cleaned and were once more in a spick and span condition, they looking none the worse, except in some cases for the worn appearance of the tires, for their long journey. The vehicles are displayed in two long rows, the privately-owned cars on one side and the manufacturers' cars on the other. Throughout the week the visitors to the Palace have shown considerable interest in the vehicles which have thus endured the severest tests to which they have yet been put in this country. To-night (Saturday) most of the cars will be removed from the Palace, and those of our readers who have not already seen the victors should take advantage of the few remaining hours to inspect a collection of vehicles which represent some of the best yet turned out by British automobile manufacturers.

A SOCIAL REUNION.

UNDER the genial chairmanship of Lord Kingsburgh, the Chief Justice Clerk of Scotland, a goodly number of those who had endured the 1,000-mile Trial met at dinner at the Trocadero Restaurant, London, on Monday evening. Most of those who had come through the ordeal with success were present, and the recounting of experiences gave a lively turn to the conversation.

The tables having been cleared the chairman announced that he had consented to occupy the chair on condition that no speeches were made. With characteristic humour he then proceeded to give the most delightful little address of the evening recalling a visit to America in 1875 and retailing anecdotes in the style of a practised *raconteur*. To set down in print the choice stories of the landing at New York, the hotel-keeper in the far West who had only met one private in the United States army, and of the Jew on board ship on the return voyage, would be to rob the quaint stories of their exquisite setting. Humour, in fact, marked most of the speeches, the brevity of which was generally commendable.

The Hon. C. S. Rolls introduced by the chairman as one who could make some observations on how to "go up hill slow," had a good reception on rising to give his impressions. Modestly disclaiming the credit of his foremost position, for which the possession of a good machine was, he said, greatly responsible, Mr. Rolls thought that the behaviour of the vehicles which had gone out for the first time was an important matter worth consideration. On the evening before the sealing of the vehicles he discovered that the fourth speed gear-wheel of his machine had never been hardened. Mr. T. B. Browne placed at his disposal one of his Panhard cars which was pulled to pieces and the gear replaced between 11.30 p.m. and 6.30 a.m. on the morning of the Trial. They ascertained during the process that the gearing originally designed to transmit 4 h.p. was the identical gear designed for his 12 h.p. machine. In his opinion the most striking vehicle on the tour was the Napier. It was the first vehicle turned out by that firm who had had no experience in that direction before. Without being ashamed to copy the good features of the French vehicles, most important improvements had been made by Mr. Napier which had resulted in it being possible to obtain for £500 a car of the kind they had seen in the Trial. Upon that they should congratulate themselves. If credit was given to the drivers of successful vehicles, even more credit should be given to those whose misfortune it had been to drive vehicles which were hardly ready for a test of that sort, and to the energy and determination to get through amounting to heroism on the part of those drivers was due the credit of having had

so many vehicles in at the finish. That was one of the most satisfactory features of the Trial. The fact that out of some sixty starters about fifty got through was bound to deeply impress the public mind. But the credit of that magnificent proportion was due mostly to the way in which the drivers had stuck to their vehicles—sometimes being two or three days behind the rest of the party, yet sticking to their machines, having at heart the determination to contribute their portion to the success of the Trial.

Professor Boys said he had had every advantage in having enjoyed the hospitality of those driving cars, having been 400 miles on the road. As one of the judges he had watched all that had been going on with the greatest interest. Some arithmetical fallacies had been discovered during the course of the trip, and an acquaintance shown with the doctrine of limits. If they divided the distance travelled by the time it took some imagined the rate was thirty miles an hour. But it was only twelve. (Laughter.) They thus arrived at a practical exemplification of the mathematical doctrine of limits. It was something new to mathematicians that the doctrine of limits was dependent on the need of the case. In addition to this new experience there was another factor—the geographical one—and the limit, which was found to be twelve in this country, was ten on the other side of

[Argent Archer, Kennington.

the Tweed. (Laughter.) An enormous amount of pleasure had been obtained from the Trial, and there had also been an enormous increase in the wealth of the country. He joined the run at Manchester, from whence they passed through thirty solid miles of people. It would be fair to reckon about two to one yard and eight or ten deep on each side of the road. But taking a lower estimate of one person to the yard on each side of the road all the way, or lower still, 1,500 people to the mile on each side they would find the Trial had been witnessed by 3,000,000 people. Some of them travelled some distance and paid 15s. or £1 for the pleasure of the sight of the automobiles. Supposing each person considered the sight of a car worth a penny, 3,000,000 people and fifty cars resulted in 165,000,000 sights of a car or a sum of £687,500. Everyone who ran a car must have spent £100. Fifty cars at £100 a car amounted to £5,000 on the debit side as compared with £687,500 on the credit side. There remained therefore a balance in the possession of the country of £682,500. (Laughter.) That was the value of the pleasure which the country had received and not paid for. It might possibly be advantageous to the country that something in the nature of road races should be considered. If for the pleasure of witnessing such miserable speeds as twelve miles an hour such crowds assembled what a revenue could be raised if the top speeds were used? The country might be persuaded that once in a way something in the nature of a road race might be worth having.

The Hon. J. Scott Montagu, M.P., asked to speak on the question of dress, said his own coat had proved very comfortable although it did not perhaps look very smart. As regards special features they remembered the boots of a certain editor and the

A FEATURE OF THE TRIAL.

approved fashion with which some of the drivers were got up. The great question was that of headgear. He had tried the ordinary cap and also the yachting cap and was inclined to believe that the headgear of the automobilist would have to be a sort of mask to go over the head like a fencing mask. The Trial had been a great success and he had found the railwaymen on the line he travelled and the members of the House of Commons equally interested in the results. With regard to future legislation he thought they should license the man and not the vehicle. This would be better than numbering the vehicles. Although automobilists were superior to all the disfigurement that arose from mud, etc., they should recollect that the public had not yet been fully educated in the matter.

Colonel Magrath related some experiences with his motor-car in Ireland, these being chiefly the association of the vehicle, by the natives of the West, with the nether world. He suggested that a party should be got up to go round Ireland.

Mr. S. F. Edge said one of the little engines engaged on the Trial had made 6,342,000 revolutions. Many people had an idea that when they came to a stop, motor-cars were in their normal condition. The Trial had done something to dispel that idea. Some of the travellers had seen parts of cars on the road and they turned up as complete cars, seemingly little different to when they started.

Mr. Staplee Firth said the only pleasure he had was to see the cars start. He did not propose to go into the neolithic age or into matters pre-Adamite. They had authentic records as to the antiquity of the horse for drawing purposes, travel by oxen, ass, elephant, zebra, camel, and other four-legged animals. These had been the only mode of transit supported by the genus *homo*, and he did not think the pace had altered much during the Christian era. He could not understand why men should want to go quicker along the roads than did their forefathers and he put it down to the fact that they were bad bold men. There had been eleven travelling days in the Trial, averaging 96 miles a day, and a coach changing horses every fifteen miles and going nine hours a day would have had to have had 288 horses to cover the distance. It was a great shame that 288 horses were thus to be

put out of employment. At the same time there was the fact, and it would prove a great awakening in the country.

Mr. E. Kennard thanked Mr. Edge for the splendid way he had controlled his Napier car during the Trial. They might have had some close shaves, but they had gone through safely. The order for the car had been in the hands of Mr. Napier for nine months, at the end of which period he produced a car of which he had every reason to be proud. His 8 h.p. had been a success and even greater things could be anticipated from the 16 h.p.

Mr. Egerton referred to the attitude adopted by various automobilists, varying from complete curves and the upright position to the horizontal attitude sometimes necessitated.

Mr. Mark Mayhew, L.C.C., said he was asked during the Trial to take a gentleman back to his country seat near Sheffield. It was soon evident that that gentleman wanted to try the machine to its utmost. First they ascended a little hill between one in six and one in eight. Then they left the high road to go up a lane in which were two cart ruts seven inches deep. This led to a colliery yard, further on they got to a factory yard, and that opened on to the river. His friend pointed out a ford. Down the steep bank they went and on to the river bed, and the water put out the burners. They got a few men from the colliery to pull the car on to the pavé, and having re-started the engine, climbed the bank backwards successfully.

Mr. C. Cordingley, invited by the chairman to deal with side-slips, said his few experiences had not been very happy ones. He got to Calcot Park very well, but soon after that his trouble began. He lost his tire and had to return part of the way in a style of dot and carry one. It took two hours to do seven miles, and he had had trouble ever since all the way. He had discovered that the exhaust pipe was too small. His burners had been blown out all the way round. He started in bad health and ended in bad health; having indulged in a form of physical exercise to which he was not accustomed. He should not care to again have to do what he had had to do.

Lord Kingsburgh said all engaged on the Trial owed a debt of gratitude to the secretary, Mr. Johnson. All the arrangements made for carrying out the run had been admirable. There had been no delays, and no chafing, and there had been perfect good humour and kindness all along. A great deal of that was to be attributed to the splendid organisation. It was very often in public affairs and in sport of any kind that people took revenge on one another for discomforts to which they were subjected by their officials. Nothing of that kind had occurred in connection with the Automobile Club's Trial. He was quite sure Mr. Johnson would be the last man in the world to desire that all those who had assisted him should not have their full meed of praise, but without a strong hub on the wheel, such as he had been, it would probably have gone to pieces. While they should congratulate him upon the success of the tour they should also congratulate him not only as an official but as a friend—extremely courteous. There never was the right man in the right place more than in the case of Mr. Johnson.

Mr. C. Johnson (secretary), who was greeted with musical honours, said he was extremely glad to have that opportunity of speaking because there were present some of the gentlemen who had assisted him in connection with the Trial. They had had to do the drudgery whilst he had had to tell them what to do and get all the credit. There were present four of the officials of the club on whom had fallen a vast amount of weary labour which none of them knew anything about. In a case of that sort it was several months' work. He had been able to speak of the provincial committees elsewhere, and would then speak of work done at the Club. There was the permanent official, Mr. Chant, who had had to do work under adverse circumstances; Mr. Joy, who had done invaluable work in connection with the June show, without whose assistance the official programme would not have been what it was; Mr. Tousey also went in, and would sit down at night and begin work, and keep on till four o'clock in the afternoon. The club steward, Mr. Burrows, had been all through the tour, and his constant amiability and willingness to help everywhere in every possible way was also recognised. So far

as he (Mr. Johnson) was concerned he was a paid official of the Club, and he simply did his duty. What he had appreciated most was the leniency with which people connected with the tour had taken very abrupt answers. He found that driving a vehicle all day and settling down to work at night was somewhat of a strain. The cordiality that had existed throughout the Trial was remarkable. There had been no friction between any one person and another, and that had been one of the secrets of the success of the Trial. It was very pleasurable to see the owners of competing vehicles helping each other. The attitude of the Press also called for remark. If they took the Press principally concerned with automobilism they might congratulate themselves that they had dealt with the thing fully and fairly. In the general Press certain papers had devoted a very considerable amount of space to the Trial. The papers which had hitherto confined themselves to accidents associated with automobilism were now recognising that motor-vehicles were worthy better notice. In conclusion he thanked them most heartily for the toast, and asked them particularly to remember the assistants who had been associated with him.

Mr. Worby Beaumont referred to the theories of Professor Boys and others with regard to action at a distance, and instanced the case of the sheep that stumbled and pitched its head on the other side of the kerb, converting it forthwith into mutton, as an example of action at a distance. In the days when horses were used to carry people to Birmingham, each horse required 140lbs. of oats per passenger. By train only 2½lbs. of coal per passenger were required, and the saving of

SOME EXPERIENCES.

Recognition of Mr. C. Johnson.

MONDAY'S pleasant function at the Trocadero was fitly brought to a conclusion with a speech by Mr. Claud Johnson, whose rising caused the company to break the orderliness enjoined by the chairman, and to burst forth into song, "For he's a jolly good fellow." That has been recognised all along the route. Never has there been a hitch; the flags have never sent the travellers in the wrong direction; the programme was exact in every detail; the minor arrangements omitted nothing, and altogether the achievement was something notable in the way of organisation. And to this capacity for work Mr. Johnson adds a considerateness for those who have been associated with him that showed itself in his modest reply to the toast of his health. He gratefully recognised the devotion of assistants, and the enthusiasm of local committees, and made graceful tribute to the valuable help he had received from them.

Proposed Testimonial.

QUITE spontaneously the appreciation of Mr. Johnson by those engaged on the Trial is to be shown in another way, and we are glad to be able to announce that this is to take the form of a present. The subscriptions are limited to £1, and should be sent to the Hon. C. S. Rolls, South Lodge, Rutland

Photos by

THE CARS AT THE CRYSTAL PALACE.

[Mr. Percy Richardson.

time by the train carrying 500 people from London to Birmingham was 1.4 years of the life of a man. He referred to the valley near Dunstable which had been filled up with material taken out of the adjacent hill, and advised automobilists and others to advocate similar improvements of the roads elsewhere.

Mr. Roger Wallace, president of the club, in proposing the health of the chairman, said the Lord Justice Clerk had done much by his presence and by his addresses to help automobilism.

The Lord Justice Clerk, in responding, said he hoped the judges would give a careful report on certain cars which had not succeeded in completing the run, for he was confident that in most of these the causes of apparent failure were not causes connected with the motor parts of the vehicles, and often with axles and springs, etc., which might happen with any carriage. None could really be attributed to the principle on which the automobile was worked, but to minor details. During the Trial it had been shown that there had been plenty of gentlemen of resource engaged. He had seen a pump which was a curiosity, and might form the beginning of a museum, to be kept at the club, of works performed under difficulties. He suggested that automobiles might usefully be used in connection with railway services. Energy combined with reasonable care as regards capitalisation was required in the production of automobiles, or more harm than good would be done.

THE municipal authorities of Atlantic City, N.J., U.S.A., have fixed a tax of 25 dols. (£5) on motor-carriages.

Gate, S.W., who is acting as hon. secretary. Services so genially and admirably rendered deserve recognition, and the promptness with which the idea of a testimonial has been taken up is in itself, a tribute which should give enhanced value to the intended gift.

The Roads and the Weather.

AUTOMOBILISTS will be glad to read that the *Field* recognises the very satisfactory results obtained by the Automobile Club's Trial. Reviewing the roads encountered and the climatic conditions met with, our contemporary adds:—"During the first fortnight the weather was uniformly favourable, no rain to speak of being encountered; but in the second week a change occurred, and the Monday brought some unpleasant experiences for the travellers, when heavy rains and wet roads were encountered; nor did the interval of Tuesday, which was devoted to exhibition purposes, bring any improvement in the weather, for on Wednesday the conditions were distinctly worse. Although this experience has been most unpleasant for all concerned, it is satisfactory that the competing vehicles should have been subjected to the severe test which rain, strong winds, heavy mud, and slippery roads impose. These conditions have prevailed, too, over some very hilly parts of the course, which have further added to the severity of the trial."

Last Week's Conditions.

IN the journey from Edinburgh there was a strong south-west wind, which made itself severely felt as soon as Dunbar was reached and the coast line followed down to Newcastle. Fortunately, however, the roads were good. On the journey to Leeds the mud was very heavy, and on the 9th inst., when the run was resumed to Sheffield, the weather was even more unpropitious than that experienced on Monday, for on the northerly stretch to Harrogate the travellers had to face not only a heavy rain, but a strong and cold wind. The roads throughout were heavy and holding, though after turning south the wind was favourable. Many of the cars had their powers tested to the utmost in surmounting some of the stiff ascents encountered. On Friday the weather was cold, and plenty of rain on the concluding day laid the dust, until St. Albans had been passed, and made the roads greasy.

The Pluck of the Drivers.

AT Monday's dinner the Hon. C. S. Rolls paid a well-deserved tribute to the pluck and determination shown by the drivers, whose careful attention contributed much to the success of the Trial. To drive a successful car was comparatively an easy matter; but to endure the annoyance of breakages, the inconveniences of punctures, and the comments of the crowd on the belated ones was a trial to many. On the way to Sheffield the driver of one of the Eureka's was on the road from 3 a.m. to half-past one on the following day—a trial of physical strength, no less than a strain on the system as a whole. Nothing, too, could exceed the pluck and determination displayed by the driver of Simms' motor-wheel. All who had an opportunity of seeing how perseveringly he kept on despite the most discouraging circumstances expressed their admiration of his endeavours, which, at times, were almost heroic, displaying a high courage and steady nerve. Mr. Buck, who rode the Motor Manufacturing Company's tricycle, also deserves mention in this connection.

Mrs. Kennard.

MRS. KENNARD, the eminent novelist, from whose pen we publish an appreciation of the smaller cars engaged in the recent contest, was, we regret to learn, the victim of her De Dion voiturette having a bad side slip in Lincoln. It threw both the lady and her man into the road. Her home being at Market Harborough, Mrs. Kennard did not proceed further than Northampton on the 1,000-mile Trial.

A Serious Business.

EVERYONE engaged on the Trial took the matter seriously, and when not on the cars all seemed to think of little else. There was no waiting at the roadside for others, no refreshing the inner man when on the trip, and nothing but a steady devotion to business throughout the whole of the three weeks—strong evidence of the importance with which the Trial was regarded by automobilists.

Doctors and Motor-Cars.

AN interesting sidelight is thrown upon the use of motor-cars in emergencies by the way in which country doctors are joining the movement, and either displacing the familiar gig or trap of the country practitioner by a natty motor-car, or else adding a car to their existing stud of horsed carriages. According to the *Daily News* correspondent on the Trial, the provincial medical man finds advantages in the fact that he can start on the instant, as no motor-car requires harnessing, and he can, and generally does, start alone, taking the sportsman's pleasure in driving himself. Thus it is that motor-car firms find doctors, perhaps, the most numerous among their customers.

The Locomobile.

ALL the cars entered for the Trial were, with the exception of three, driven by petroleum spirit. Of the trio only one—the Locomobile—got to the Crystal Palace on Saturday. The others, with many of the petrol cars, which failed to cover the distance, were mostly of an experimental type—a fact that should not be forgotten in estimating results. The success of the Locomobile driven by Mr. H. N. Searles was all the more satisfactory as the particular vehicle engaged in the Trial was not the one which it was originally intended to run. Mr. Searles expected to have had a new vehicle with all the latest improvements, but it did not arrive in time, and that actually in the run was an ordinary car of the runabout type. Its performance in the Trial has drawn much attention to the subject of steam-propelled vehicles, and already many inquiries are afloat with regard to the Locomobile.

Luck.

AS we observed last week, luck seems to have entered very largely into the Trial. We thought we had established a record in having two ignition tubes go within about two hours, but a Peugeot easily makes a record, having had four burst in one day.

Mr. Cordingley's Car.

REFERENCE having been made in the press to the early mishap to Mr. Charles Cordingley's car, the following item of news may be of interest. After the tires had gone wrong on the first day of the trip Mr. Cordingley had a new set of wheels, and not being prepared to adopt pneumatic tires he watched the performances of those on the char-à-banc engaged in the Trial. These had flat tires, vulcanised on to vulcanite by an English firm—in a similar style to that of German firms. The experience of the char-à-banc, however, has decided him to abandon all idea of flat tires in the future.

The Brown-Whitney Steam Car.

ALTHOUGH not perhaps with the success achieved by several of the participants in the Trial, the Brown-Whitney steam car completed the whole journey, arriving in London late on Saturday night. In the course of a chat at the Crystal Palace with Mr. Banks, who had driven the car all through, he said that the Trial had proved of great value as showing the points which needed attention to render the car a reliable vehicle. Messrs. Brown Bros. are by no means discouraged; on the other hand, they have still every confidence in the car; and by taking full advantage of the valuable practical experience gained during the past three weeks should produce a steam vehicle fulfilling every requirement.

The Ariel Tricycle and Whippet Trailer.

THE Ariel tricycle and whippet trailer No. 4 behaved splendidly throughout the Trial and proved a most speedy combination. In the flying mile race in Welbeck Park, a time of 2min. 2.5sec. was recorded, while Nottingham was reached only 30sec. behind the Hon. C. S. Rolls' Panhard. In fact, it has been in the first flight throughout, and on the last day's journey a good run was made, the machine, as shown elsewhere, being third to reach London, following immediately after Mr. Rolls's car and Mr. Kennard's Napier.

The Lanchester Cars.

MISFORTUNE seems to have followed the two Lanchester cars entered for the Trial. Owing to a flaw in a casting one of the vehicles was quickly placed *hors de combat*, while on the last day the second one (No. 22) had a troublous time in consequence of a broken bush connected with the cam. Some time was spent in making a temporary repair, but this giving

way it was decided to make a permanent repair at Leicester. This occupied some considerable time, but eventually the car was got in order, and, although not reaching London until ten minutes after Saturday midnight, the return journey was made in good style, a non-stop run being made from Northampton.

The Marshall Cars.

Two Marshall cars participated in the Trial, Nos. 24 and 49. The first one had the misfortune the week before the Exhibition at the Agricultural Hall to be run into and badly damaged by a railway lorry. Although put in order as far as possible in the time available, the car was still far from being in perfect order; yet Mr. Mann persisted in starting it in the tour, and in spite of numerous incidents on the way, due, it is said, to the somewhat twisted state of the frame, the vehicle got back to London soon after midnight on Saturday. The second Marshall car—No. 49—a new and untried vehicle straight from the works, was much more successful, notwithstanding some trouble early in the Trial. On the first day's journey from London to Bristol the pump in connection with the water circulation got out of order. As it was not possible to replace it Mr. Mann decided to remove it and run along without a pump, although the circulation was really only arranged to work with the aid of such a device. Under the circumstances it is noteworthy that the motor ran so well, and like many others it must have known on Saturday that the last day of the Trial had come, for it behaved splendidly, the car reaching St. Albans in ample time to join in the procession to London.

Protection Against the Weather.

THE great variations in the temperature experienced during the Trial proved to be another sort of trial to many of the participants, and the necessity of special provision in the way of clothing was made clear. Quite a number of those who made the long journey, including ourselves, had in use Burberry's "Automo Slip-on" Gabardine Combination, and from practical experience we can strongly recommend this as being a most desirable adjunct to the outfit necessary for a motor-car tour. Even when worn over an overcoat we found it exceedingly comfortable and free fitting, and as a protection against sharp winds it was simply invulnerable. Fortunately we had no extended opportunity of testing the water-proof qualities of the Combination, but in this connection those who have adopted it have nothing but praise to offer.

The Wolseley Voiturette.

ONE of the vehicles in the voiturette class which has stood out prominently during the Trial was the Wolseley, No. 40, driven by Mr. Austin. Except for trouble with the tires, which attended the car almost daily throughout the trip, Mr. Austin turned up smiling every day. On the run from Nottingham to London the vehicle soon gave us the go by, and although we saw it for a few miles on the hilly part of the journey and again repairing a punctured tire, it eventually got away and arrived in ample time to join the procession from St. Albans, being eleventh at that place.

Casualties.

Invention says:—"The total casualties of the motor-car long-distance Trial were a dead dog and a broken-legged horse. It was distinctly the fault of the animal in each case. The horse injudiciously whipped round at right angles in front of a car, and the dog foolishly believed that a bite out of a tire would do it good." Later returns include a hen and a sheep, the death of the latter occurring on the last day of the Trial, an illustration of the "action at a distance" to which Mr. Worby Beaumont referred at Monday's dinner.

THE SMALL FRY OF THE TRIAL.

THE great 1,000-mile Automobile Trial is a thing of the past, but it will live until death in the memory of those who took part in it. From first to last, the tour was a triumphant success, in which the fleet of motors, with but few exceptions, covered themselves with glory. To run over 1,000 miles, however, means motoring in deadly earnest, and hand in hand with great enjoyment went much strenuous endeavour and arduous strain. For it was not all play. The motor-carists had to take the rough with the smooth, and derive consolation often from the fact that they had surmounted difficulties. But is not this the highest kind of enjoyment? Who would give a thank you for success, where all is fair-sailing and monotonous? The variety of motoring constitutes its principal charm. We were only small fry, shrouded in the generous dust of flying Panhard, swift Napier and stately Daimler. They, we knew, looked down upon us; but we did not look down upon ourselves. And as day after day passed, and still we held together in close communion, we felt we were entitled to our self-respect. For did not we scale the rugged heights of dreaded Shap Fell, climb like so many flies over the yet deeper gradients of Dunmail Raise, and struggle through the mountain passes of Birk Hill, in spite of rain overhead and execrable surface under wheel? We came to be a band of brothers, we of the De Dion voiturettes, the Gladiator, the Wolseley, Triumphs, etc., etc. We sympathised with one another's misfortunes; we admired each other's feats of valour. The same spirit animated us all. We were determined, with a grim and steadfast determination, to reach the final goal in spite of every obstacle. And when the evening came and we got into port, and recognised our brave comrades, how pleased we were! How hearty the greetings and warm the hand-shakings. With almost passionate admiration we hailed that pair of heroes—the Eureka man and he of the Simm's motor-wheel. They worked throughout like Trojans and deserve the Victoria Cross for valour in the field. Brave Jules Dubois, too, conductor of the Décauville, how nimbly he ran when his motor slowed down at some steep eminence; how ably he assisted it on all occasions; what wondrous agility he displayed! Ah! ye proud, high-powered cars, laugh at the poor little struggling small-fry as you will—the honours of the expedition lie with them. You were consistently reliable, we had our troubles—not a few. Punctures, pumps, sparking plugs, ignition, carburettor, all contributed to swell the list, and at some period or other we were afflicted. And yet with all your speed and power you could not shake us off. We clung tenaciously to your vanishing forms, and informed you of our presence at the various controls. We fairly astonished the Benz division and some of the older Daimlers. We were an army of midgets if you like, but an army not to be despised even by the Leviathans who smiled whilst they marvelled at our performance. It was predicted at the start that we should succumb. Not we. We had no idea of giving in. We toiled, we struggled, we laboured, we strove, and success spelt in large capitals around our efforts. We proved that the voiturette of to-day is not a mere plaything, but a vehicle capable of surmounting steep gradients, of carrying its passengers in safety over good roads and bad, and of doing 120 miles in the day. A De Dion can be bought for £195, a Gladiator costs £165 or thereabouts, a New Orleans, £140, a Wolseley, £225, a Triumph, £230. Intending purchasers may safely invest in any of these. There is no need to dally for improvements. Improvements, of course there will be in process of time, but Father Time has a soft, slow way of stealing the years, which deprives laggards of untold enjoyment. Be bold, gentle public! Throw aside your caution and procrastination, and take what the present offers. Buy a small car, learn to drive it, then exchange for one of higher power, you will never regret your temerity. Troubles you may have, especially at first, until you understand your motor, but given a certain amount of will and intelligence, and you will defy them all. They will melt away as a mirage in the desert. A new world will be opened out to you; an amusement for your youth, an occupation for your middle age, a refuge for your declining years; so, dear public, hurry up, take the plunge, be happy, be courageous, join the band of small fry, who have gained an honourable place in the recent contest, and open inviting arms to you to enter their ranks.

MARY E. KENNARD.

MOTOR-CARS ON THE CONTINENT.

Motor-cycles at Vienna.

On Sunday last, at Vienna, the Automobile Club of Austria scored a big success with their capital programme of motor-cycle races, a numerous and enthusiastic attendance gathering together to witness the various courses. The first event was a hill-climbing contest over the stretch of road separating Nuwaldegg from Exelberg, a distance of 4 kilometres 200 mètres, and categories were provided for professional and amateur riders. In the former class the well-known French *chauffeur*, Gasté, scored a brilliant success, while in the latter M. Stead came in an easy first. The scene of operations was then changed to the Prater cycle track, where a 10,000-mètres race was set down for decision. An excellent struggle was witnessed between Gasté and Diétrich, the former eventually proving the winner by a lap and a quarter. His time for the distance was 10m. 18½s. Gasté then turned out for an attack upon the hour record, and succeeded in setting up new figures for Austria, although his performance was a long way behind the best of those made in France. In the sixty minutes he covered 59 kilometres 886 mètres, and was accorded a great ovation at the finish of his ride.

The German Automobile Club.

SATURDAY was a red-letter day in the history of the German Automobile Club, for it was then that the magnificent clubhouse in the Sonnerstrasse, Berlin, was formerly inaugurated by the Duke of Ratibor, in the presence of a numerous and distinguished company. These included the Prince of Thurn and Taxis, Count Clemens von Schoenbrun, General Becker, General von Hoesleuffer, Herr A. Klose, Herr C. von Kuhlmann, Count Talleyrand-Périgord, and many other well known personalities. When, at nine o'clock, the Duke of Ratibor entered, the florally decorated club rooms presented a really brilliant appearance, and the President's popularity was made manifest by the hearty welcome accorded to him by the members. The club has a great future before it, and bids fair to rival in magnitude that club of all automobile clubs, the A.C.F.

Sale of De Knyff's Car.

IF recent rumours are to be believed M. René de Knyff has disposed of his wonderful racer for the sum of 60,000 francs, that is, £2,400 sterling, so either he looks upon racing as dead in France or his new car is nearing completion. It is said that the purchaser of the winner at Spa, Pau, and Nice, not to mention "Le Tour de France," is an American, Mr. Albert Bostwick by name, and a member of the Automobile Club of America. The price—£2,400—is pretty tall, but it does not equal the sums generally supposed to have been paid by the purchasers of the cars owned by M. Albert Lemaître and M. Charron. The former is stated to have received £2,760 for his last year's Nice winner, and M. Charron £120 less for his car, but it is very difficult to ascertain the correctness of these statements. If, however, the figures are accurate then De Knyff's car was disposed of cheaply, for it had accomplished infinitely better performances than either of the other two. For Mr. Bostwick's own sake it is to be sincerely hoped that he will not really test the top speed of his new acquisition until thoroughly familiarised with its slower speeds, for at fifty miles per hour a car requires some driving.

An Electric Car's Record Run.

AT last the B.G.S. electromobile has broken the spell of bad luck which of late has dogged its footsteps, or, rather, wheels, and has succeeded in achieving a truly remarkable performance. In the Critérium d'Electricité, a profound *caniveau* taken at rather too fast a speed caused a short circuit, and when a fresh trial was made some few days later a collision with a carrier's cart placed the self-propelled vehicle *hors*

de combat. But on Saturday last these troubles were completely forgotten in the triumph of a record performance, and a veritable record; 262 kilomètres, or 164 miles, covered at an average speed of 16 kilomètres (10 miles) per hour, on a single charge, is something to be proud of; and this was done on no selected level route, but over the Paris-Dijon road, which is for the first 200 kilomètres out of Paris of an average hilly nature, and then becomes a veritable route of mountains, extremely trying for a car which has already traversed a couple of hundred kilomètres. The grade of these hills of the Bourgogne are frequently 11 and 12 per cent., pretty stiff work for an electric vehicle, especially after a long run. And this is what M.M. Garcin and Prade found on Saturday last after arriving at Tonnerre, 200 kilomètres from Paris, with a comfortable lead of 82min. on their schedule time. The next 18 kilomètres took them an hour and a half to cover, the voltage falling from 88 to 84. Even then the hills were far from finished with, for on leaving Ancy-le-Franc excessively steep grades were encountered at Nuits-sur-Ravieres, Fuloy, and finally at Sombernon, where the voyagers were compelled to relinquish their task. Here, exactly 262 kilomètres from Paris and 64 from Dijon, this memorable journey was terminated, and M. Krieger's previous record beaten by no less than 110 kilomètres. The car itself is one weighing 2,300 kilos, the two batteries accounting for 1,260 kilos of the total weight. M. Prade, of *Le Vélo*, who, as above related, accompanied the car throughout the trial, gives the following interesting particulars concerning it. The two batteries consist of forty-four grouped elements, each element weighing 14 kilos, and containing 9 kilos 600 grammes of plate. The batteries' total capacity is 325 ampère-hours, that is to say, 33 ampère-hours per kilo of the vehicle's weight. At the normal speed of 22 kilomètres per hour on the level, the motor takes 36 ampères at 90 volts. This makes 65 watt-hours per kilométrique ton at 22 kilomètres per hour. The car has eleven combinations, five speeds, two reverse speeds, two electric brakes, and possess a system of recuperation, by means of which, during this record run, an average of 40 ampères was made in the descents. The greatest consumption was 100 ampères at the first speed in ascending the hills of Lézuines and Ancy.

Critérium des Moto-cycles.

In spite of all gloomy forebodings the prefectural authorisation has, following the custom of former years, been duly accorded to *Le Vélo* for the three motor-cycle and voiturette races, which are annually contested over the well-known Etampes-Chartres route under the direction of that paper. Certainly the fifty kilomètres of road separating the two towns is singularly free from those little hamlets and agglomerations which occur at such frequent intervals on the majority of French routes, but nevertheless serious fears were entertained that it was the firm intention of the authorities to make a clean sweep of all automobile races irrespective of the route or the conditions under which the contests would be decided. Judge, then, of the surprise and pleasure when it was ascertained that the organisers of the three races, known as *Les trois Critériums du Vélo*, had been successful in their application for the necessary authorisation. I can assure you that the avenue de la Grande Armée presented a more joyous appearance when the good news became known than it has done since the commencement of the month. "Three more races at any rate," was the cry, and *chauffeurs* fairly beamed with satisfaction. The permission accorded to *Le Vélo* emphasises the absolute necessity of reducing speed to a walking pace when passing through the villages and hamlets bordering the route; it lays stress upon the importance of each competing vehicle being distinctly numbered and insists upon the organisers of the races assuring themselves that each competitor holds the required certificate of competency. The three days selected by the promoters were May 10th, 17th, and 31st, so a couple of the events have already been decided. But it is of the first race that I now desire to give you particulars, the course reserved for motor-cycles. This event brought together an entry of twenty-one, of whom fifteen presented themselves at the starting post, the notable absentees being

Teste, last year's winner, and Bardin, who won the race in 1898. Previous to the start, which was timed for one o'clock, the formalities of weighing were duly gone through, and as it may be of interest to know just what these racing machines scale I will quote the weights:—Béconnais, one cylinder, 144 kilos.; Rigal, one cylinder, 134 kilos.; Marcellin, two cylinders, 159 kilos.; Osmont, two motors, 192 kilos.; Tart, one cylinder, 142 kilos.; Baras, two cylinders, 169 kilos.; Vasseur, two motors, 182 kilos.; Romain, one cylinder, 139 kilos.; Renaux, one cylinder, 248 kilos.; Joyeux, one cylinder, 137 kilos.; Delisle, one cylinder, 130 kilos.; Loste, two cylinders, 156 kilos.; Battaiellie, one cylinder, 128 kilos.; Bectin, two motors, 197 kilos.; Didier-Nauts, one cylinder, 124 kilos. It will be at once noted that the machine ridden by Renaux only just comes within the official limit of 250 kilos.; indeed, until he removed his tool bag the cycle was over-weight. I say "cycle," but the machine is a veritable voiture, propelled by one single cylinder horizontal engine, which may be run while the vehicle is at rest, just as in the case of a carriage. In order to avoid any possibility of mishap the fifteen competitors were despatched one by one at minute intervals, and the start was effected without accident, and with the sole incident that Béconnais, who was the first to leave, lost a minute of valuable time at the level crossing of Paray owing to the shunting operations of a goods train. This delay enabled Marcellin to practically come up with the leader, but at Ablis, 28 kilomètres from the start, Béconnais had drawn away again and held a lead of 90sec. At Gué de Longroi the order was, Béconnais, Marcellin, Osmont, Tart and Baras, and with the exception of Baras taking the place of Tart, the same order was maintained at Chartres, which town marked the half distance. The respective times made by the fifteen competitors for the first fifty kilomètres (31½ miles) were as follows:—1, Béconnais, 38min. 24sec.; 2, Baras, 38min. 29sec.; 3, Marcellin, 38min. 42sec.; 4, Osmont, 39min. 26sec.; 5, Tart, 39min. 52sec.; 6, Joyeux, 41min. 4sec.; 7, Delisle, 41min. 22sec.; 8, Didier-Nauts, 42min. 22sec.; 9, Bertin, 43min. 28sec.; 10, Vasseur, 44min. 21sec.; 11, Rigal, 45min. 8sec.; 12, Renaux, 46min. 28sec.; 13, Romain, 52min.; 14, Battaielle, 52min. 27sec.; 15, Loste, 54min. 57sec. Béconnais's time was 16min. 26sec. faster than that of Teste, who last year was leading at Chartres. The turn safely negotiated by the competitors, they set out upon the return journey with all haste, and Marcellin by a spell of exceptionally fast travelling succeeded in passing both Baras and Béconnais. At Ablis he held a two minute lead from the latter, and this advantage he slightly increased during the remaining 28 kilomètres into Etampes. Béconnais finished second, but as he started before Baras the official classification placed him but third. The only competitor who did not complete the course was Osmont, and he had the misfortune to break one of his pistons when lying third, and only 4 kilomètres from the finish. Distinctly bad luck! No fewer than eleven of the *chauffeurs* beat Teste's time in last year's race; the average speed of all fourteen competitors being 60 kilomètres per hour, while that of the actual winner was no less than 71 kilomètres per hour. Thanks to perfect organisation and the fact that the competitors were all highly skilful and experienced riders not a single mishap or unpleasant incident occurred to mar the harmony of the race, a fact which should have some weight with the authorities when dealing with the question of automobile racing. If the number of competitors were limited and the entries of riders known to be perfectly competent only were accepted, the courses would lose much of that element of danger now existent. I grant that such a plan would be difficult to carry into effect and would give rise to unpleasantness on the part of those motor-cyclists who might be excluded from competing on the ground of incompetency, but nevertheless the scheme is perfectly feasible. I append the official classification of the fourth Critérium de Motocycles, and to enable comparison I add the times achieved on former occasions.

CLASSIFICATION.

THE German Automobile Club has just taken possession of new premises in the Sonner-Strasse, Berlin.

IN connection with the liquidation of the Motor-Carriage Depots, Limited, a meeting is to be held in Edinburgh on the 11th prox. to receive an account of the winding up.

AT Ashbourne Rural Council last week a resolution was carried to the effect "That in the opinion of this Council it is desirable that a tax should be levied on cycles, motor-cars, and motor-cycles."

IN connection with the race meeting of the Surrey Bicycle Club at the Crystal Palace on Saturday last, a five miles motor-tricycle race (professionals) was run off, Mr. F. F. Wellington beating Mr. C. Machin by thirty yards. Time, 8min. 6 2-5sec.

THE Baltimore and Ohio Railroad Company is introducing electric cabs in Washington in connection with its train services. The vehicles, which run to and from the railway station, are adapted for carrying two small trunks at the rear, small travelling luggage being carried on top.

THE Dow Portable Electric Assistant Company, of New York, have lately introduced a very compact battery outfit for petrol motors. The battery measures 8½in. by 8½in. by 5½in., and is intended for motor-carriage use. Another form is designed for automobile tricycles, quadricycles, etc. On the top of the battery a resistance switch is fixed, this being one of the important features of this outfit. The battery will register eight or nine volts and eight to ten ampères, while by means of the resistance attachment this output can be regulated to the desired amount and the energy of the batteries correspondingly economised.

WE have received from Messrs. A. J. Wilson, Limited, a copy of the new motor and carriage tires price list just issued by the Dunlop Company. This is a very comprehensive work, and one which should be in the hands of all motor-vehicle and carriage builders. An interesting feature of the list is a series of illustrations showing the vehicles for which the various tires are suitable. The tires range from those suitable for cars weighing up to 12 cwt. down to motor-cycles, the latter being made with plane or non-slippling outer covers. Particulars are also given of the work turned out by the company's carriage and motor-wheel department.

MESSRS. T. COULTHARD AND Co., LIMITED, has been registered with a capital of £75,000, to adopt and carry into effect an agreement expressed to be made by between T. Coulthard, J. H. Toulmin, and T. Coulthard, jun., of the one part and this company of the other part for the acquisition of the business now and hitherto carried on by them at Preston, Lancashire, to develop and extend the same, and, generally, to carry on in all or any of their respective branches the businesses of spindle and ring makers, motor-vehicle makers, tin and copper smiths, manufacturers of and dealers in all kinds of textile machinery, etc. The first directors (of whom there shall be not less than two nor more than seven) are Messrs. J. Coulthard, J. H. Toulmin, and T. Coulthard, jun. Qualification, £1,000. The registered office is at Cooper Road Works, Preston.

CORRESPONDENCE.

MOTOR-CAR v. EXPRESS TRAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am en route to London by motor-car, and on arrival yesterday at Bradford I left it for a few hours to visit friends, and came on here by rail.

I noticed in the official itinerary of the Midland Railway Company a train marked "Express to Sheffield" at 7.10. This train I caught and arrived here at 10.55, thus taking three and three-quarter hours. Had I come by motor-car, notwithstanding that the road from Barnsley to Sheffield is the worst main road in England, I would have accomplished the journey in two and a half hours.

Yours truly,

Wharnccliffe Hotel, Sheffield,
May 10th, 1900.

JAMES GLASS.

A TRIP ON A BENZ DOG-CART.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think that your readers may perhaps be interested in the following brief account of a run which I had last Saturday afternoon on one of the new Benz 9 h.p. double-cylinder dog-carts. I had previously run down to Woburn, in Bedfordshire, on Messrs. Hewetson's van, my journey having for its object the witnessing of the cars engaged in the 1,000-mile Trial on their last day's run from Woburn to St. Albans. Arriving at Woburn about 5 p.m., I found Messrs. Hewetson's secretary, Mr. Campbell, who had journeyed with a friend from London on the dog-cart. After waiting to see the remainder of the cars go through we refreshed the inner man, and eventually left Woburn at 7 p.m. With four passengers up the car ran the first six miles—tell it not to the police—in just 15 min., the fastest mile being covered in 2 min. 20 sec. The engine was running very sweetly and with so little vibration that on some of the down grades one had to look at the levers to make sure the engine was in gear and that the car was not running by its own weight. The luxurious upholstering and perfect balance of the body materially helped the delusion. St. Albans, twenty-two miles, was reached at 8.10 p.m., and having dropped Mr. Campbell and his friend and lighted up, the car, with myself and the driver who had brought us along in such splendid style, continued the journey to London, *via* Barnet and Finchley. Owing to having to proceed cautiously when running in the traffic our average was somewhat lowered for the whole run, but I may say that we ran from St. Albans to Barnet, nine miles, in 26 mins., which is pretty good. We got to Dean Street, Soho, at 9.28 after a most enjoyable trip. I should add that the car ran with absolute smoothness when mounting hills on the second speed, though, of course, no very serious climbing was necessary.

As this letter may seem very eulogistic, I should like to say that I am in no way connected with Messrs. Hewetsons, nor have I any financial interest in that company. When one finds such a good thing as this he ought, in common fairness to his fellow-men, to publish the news when and where he can.

Yours truly,

The Moorings, Sevenoaks, Kent.
May 15, 1900.

W. F. HICKS.

THE BEESTON MOTOR COMPANY.

A MEETING of shareholders of the Beeston Motor Company, Limited, was held at Coventry, on Monday, Dr. C. W. Hiffe presiding. The Chairman, in moving a resolution that the company, by reason of its liabilities, be voluntarily wound up, and appointing Mr. B. S. Dunn, C.A., of 10, Coleman Street, E.C., liquidator, said the directors much regretted the circumstances which had necessitated the present gathering. It was all the more painful, because the company had commenced to be a dividend-earning business, and because large sums of money had been spent in exploiting and perfecting the new industry, which appeared to have a great future. Some time ago the Company was obliged to obtain an overdraft at the bank, and for that to give first mortgage debentures, and at last a receiver was put in. That and the pressure of other creditors led to the present

state of affairs. He held that the directors could not be blamed for neglect of the business, but contended that the evil fortune which had attended the trade was alone responsible.—Mr. Rowland Hill seconded.—Mr. Midwinter (Birmingham) said there was some proposed action by a committee of shareholders formed by Mr. Victor Lawson against the original promoters of the Beeston Company, and he was informed they were to have shares given them of 10s. in the £ in another company to stay their action. He wondered if anything could be done by the shareholders.—Mr. Ward (solicitor, London, representing the debenture holders) said that need not interfere with the winding up, and Colonel Harris (London) said all shareholders should be served alike.—Mr. Hewitt asked what had become of the 3s. in the £ the shareholders were called upon to pay in 1897, and the Chairman replied that the money went into the business for working purposes.

The motion was carried, and a committee, consisting of Colonel Cox, Mr. Midwinter, and Mr. Fieldhouse (Birmingham), appointed to see if anything could be obtained from Mr. Harry J. Lawson for shareholders not represented on Mr. Victor Lawson's committee.

RENAULT v. THE MOTOR-CAR COMPANY.

IN the Chancery Division on the 11th inst. Mr. Justice Kekewich assented to a motion in this action, which asks for an injunction to restrain the defendant company from alleged passing off of motor-cars as of the plaintiff's manufacture standing over, his Lordship remarking that probably this was one of those cases which, if prosecuted, would have to be set down for hearing in the general list.

MR. H. H. BARING, of High Beech, has, we understand, lately purchased a 12 h.p. Panhard car.

"W. Q. M." asks for the name of the maker of an oil motor suitable for propelling a plough which would require three horses in the usual way.

THE London Autocar Company, Limited, of Grays Inn Road, W.C., are, we understand, arranging to carry a stock of De Dion 3 h.p. water-cooled motors, and all the necessary parts required for building voitures of the De Dion type.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, MAY 26, 1900.

[No. 64.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

NO patriotic procession is complete without its motor-car, and the behaviour of such vehicles in face of crowds should suggest their general adoption in place of horses on such occasions in the future. On Mafeking day the Queen and Royal Family witnessed a torchlight demonstration at Windsor. The procession was preceded by Mr. Alfred Barber, the Mayor, and Dr. Bruce-Porter in the latter's Daimler car, and having paraded the town, passed into the quadrangle of the Castle. The Mayor and Dr. Bruce-Porter entered the precincts of the Castle in the motor-car, this being the first appearance there of such a vehicle. Certainly no former Mayor of the Royal Borough has appeared before the Queen mounted on a motor-car. The rear of the procession was brought up by Mr. V. Mathias on a Benz car, with trailer attached. The cars proved popular with the people, and these two vehicles have thus had Royal distinction. Doubtless the interest of the Sovereign in the event was increased by the fact that the Prince of Wales may soon appear at Windsor in like manner, for we understand his motor-phaeton is now in the hands of the carriage builders and will soon be ready for delivery.

Patriotic Processions.

OF patriotic processions in London suburbs there have been almost a score this week, and on Wednesday night—north, south, east, and west—motor-vehicles attracted considerable attention. At Peckham the long procession was led by Mr. Tuite on his Heinle and Wegelin motor-tricycle, fitted with a trailer. Upon this an ambulance and a cannon had been ingeniously fitted, and the novel combination was enthusiastically received by the populace. At East Ham the motor-car of Mr. Louis Sinclair, M.P., was said to be in the procession; at Finchley, on Thursday, five or six motor-cars and three or four motor-tricycles were prominent features of the demonstration; and at Battersea a Daimler car represented the latest method of locomotion.

Preparing the Report on the Trial.

WE take the following items regarding the 1,000-mile Trial from the current issue of the "Automobile Club Notes":—The following judges—Professor Hudson Beare, Mr. W. Worby Beaumont, Professor Capper, Mr. Bryan Donkin, Professor Hele-Shaw, Major Holden, Professor Redwood, Sir David Salomons, Professor Unwin, and Mr. A. F. Yarrow, visited the Crystal Palace, many of them on more than one occasion, last week, and made a detailed examination of the Trial vehicles. The records of each vehicle are now being correctly checked, with the view to their submission to the judges. No time will be lost in the preparation of the necessary particulars to enable the judges to arrive at decisions as to awards; but seeing the large number of records taken

in connection with the performances of each vehicle the labour of preparing these particulars is heavy, and must occupy considerable time. A protest has been lodged against Mr. Kennard's 8-horse "Napier" being included in the private owners' section, on the ground that it was driven by its manufacturer. A protest has also been lodged against the Motor Manufacturing Company's tricycle (No. 12), on the ground that the tricycle which finished the Trial is not the machine which started on the Trial. Both these matters will be placed before the club committee.

A Belated Report.

FOR some weeks to come we may expect to have reports of incidents connected with the recent Trial. Here is one that has only just come to our notice: An accident occurred at Buxton, in which Mr. R. H. Wood, a local journalist, was riding an aluminium road racer along West Street, when two dogs, a collie and a retriever, which were fighting in the road, ran into the cycle, causing it to swerve, and a second later a motor-car smashed into it. The rider of the bicycle was thrown into the road and was badly bruised on the right hip, shoulder and arm, and his right hand injured, but he managed to roll out of the way of the car. The cycle, however, was jerked round and run over by the vehicle, which weighed nearly a ton. For fifteen minutes it was jammed under the car, and great difficulty was experienced in pulling it out. Everybody expected it would be a complete wreck, but, on the contrary, it came out of the ordeal better than was expected.

The Police.

WHATEVER may be the past and future attitude of the police towards automobilism, the various county and borough forces all along the route of the recent 1,000-mile Trial, with two exceptions, spared no pains whatever to ensure the success of the undertaking. They posted themselves at the tops of steep hills and at difficult bends; they restrained the eagerness of the village and urban populations; in fact, they assisted to the utmost of their ability in every possible manner.

Early Rising.

THE necessity of rising at the early hour of five a.m., except on exhibition days and Sundays, during the three weeks of the Trial, was quite a new experience for many of those who took part in the long pilgrimage. Yet so great was the enthusiasm shown that all were astir betimes. Even on the off days early rising was the order of the day, for the cars had to be got out and cleaned before eight a.m., ready for the exhibitions. On running days the custom was for the "boots" to call the motorists at 5.30 a.m., breakfast to be taken a quarter of an hour later, and the hall where the cars were stabled to be reached at 6.30. In most instances the halls were well away from anywhere, and cabs had frequently to be chartered. At Manchester two tram-cars were engaged, the fare charged being 2s. per head.

The Only Accident.

THE run on the last day but one of the Trial was marred by the only accident to a human being which occurred throughout the tour, and even in that case the fault was not that of the automobilists. Not far from Worksop the Ariel tricycle and trailer was overtaking a big wagon, which, though empty, had a team of three horses. About fifty yards away Mr. Cheel, who drove the tricycle, sounded his horn, and immediately the horses ran away with the wagon, and pulled the wagoner down. He fell under the wheels, and Mr. Cheel immediately rode off for a doctor, and fetched him to the spot on the trailer, the passenger having meanwhile administered brandy to the wagoner. The doctor found on examination that no bones were broken, but ordered the injured man's removal to a hospital.

The Star Car.

A GOOD car in the voiturette class whose performance is well worthy of attention is No. 51, entered by the Star Motor Company, of Wolverhampton. On the level the vehicle attained a very good speed, while its performances on the hill-climbing contests came as a surprise to many. In the Taddington Hill climb a speed of 9.15 miles per hour was accredited to the car, while the steep Birkhill, in Scotland, was mounted at 8 miles per hour. The 1,000-mile run was only marred by the breaking of the front axle on the journey from Manchester to Kendal; but Mr. Lisle, not to be dismayed, immediately wired to Wolverhampton for a new axle, and by a smart piece of work the car was ready to start on the journey to Carlisle the following morning. The run to London on the final day was made in good style, the car reaching St. Albans in ample time to join in the procession to town.

The Education of the Engineer.

WHILE the recent Trial was useful in accustoming horses to the sight of the automobile and in educating the public to a proper appreciation of its value, it will also prove of great service to those in the trade. The experiences gained as to the behaviour of vehicles, and the convenience or otherwise of detail arrangements, will prove of great value to all concerned with the design and construction of cars; and not a few improvements may be introduced as the result of the Trial.

Mr. Balfour and Motor-Cars.

MR. A. J. BALFOUR has disclaimed all knowledge of current newspapers, or we should have supposed, by his speech on the workmen's housing question in the House of Commons the other night, that he was a student of this *Journal*. For in our issue of January 5th we published an article, "A Quarter of a Century Hence," which might have furnished the text of the speech of the Leader of the House, who suggested that in the future motor-vehicles, which could take men direct from their homes to their work, would play a large part in solving the problem of the congestion in large towns. A quotation from our article, which was supposed to have been written in 1925, in view of Mr. Balfour's endorsement of the idea, is timely at the present moment:—"Recognising the utility of the automobile as an adjunct to their lines the railway companies have now a splendid service of automobiles to bring daily passengers to the stations. More than that, with the aid of local authorities, those who live in particular districts are being brought to the City by motor-vehicles, hundreds of which are employed, each having its score or so of people living in one district, say, Wimbledon, to their various offices on Cornhill or elsewhere."

Cycle Racing at the Crystal Palace.

MR. F. W. BAILY sends us particulars of the arrangements that have been made for racing at the Crystal Palace track on Whit Monday. The programme will, as usual, consist of two different meetings, the first being the motor meeting, at which the principal item will be another contest for the

Brassard Cup, wherein, it is hoped, the following riders will participate:—S. F. Edge, C. Jarrott, R. Moffat Ford, F. F. Wellington, and C. Machin. Besides these, it is almost certain that the French rider, Rigal, will come over specially to ride in this race, and it may be mentioned that he talks of bringing over with him a machine equal to sixty miles in the hour. This should certainly prove to be the most exciting contest that has taken place for the Brassard, and shows that the fame of the contests for this cup has spread to the Continent. The other motor events will be a ten-mile race for path machines, and a five-mile race for roadster machines (both handicaps), and attempts at the one and two mile records. The second meeting will consist of cycle races in connection with the Century Cup contest.

Motor-Car Service in the Malay Peninsula.

WE have in previous issues referred to the scope for the establishment of automobile services in India and other parts of the Far East, and are consequently glad to learn that steps are being taken to inaugurate such a service in the Malay Peninsula. For this purpose the Malay Transport Syndicate, Limited, has just been formed, Mr. H. C. E. Zacharias, who has, we understand, severed his connection with the Automobile Association, being the general manager and one of the directors of the new concern. The roads in the Peninsula are on the whole good, while the distances are short, averaging about twenty miles from one centre to another, so that it is considered there is every expectation of the attempt to substitute motor-vehicles for the clumsy bullock carts at present in use proving a success in every way. A large number of lines could, it is stated, be profitably worked, but it is considered advisable to commence with one or two lines only, a service from Seremban to Kwala Pilah (23 miles), and one from Seremban to Kwala Klawang (18 miles). The question of transport between Seremban to Kwala Pilah has become so important of late that a light railway has been proposed, whilst Kwala Klawang is an important centre for tin mining. It is intended to start the services with three Thornycroft steam cars adapted for the transport of both passengers and goods. In addition to operating the above-named services the syndicate has obtained, through Mr. Zacharias, the agency in the Malay Peninsula, Archipelago, and Siam for the steam vehicles of the Thornycroft Steam Wagon Company, Limited, and in Siam, Annam, the Malay Peninsula, and Archipelago for the heavy oil cars of Messrs. Roots and Venables. Although the heavy vehicles which have been ordered will not be ready for about nine months, Mr. Zacharias is, we understand, shortly proceeding to Malay, taking with him two or three light vehicles.

Nervous Drivers of Horses.

AT the Pershore Petty Sessions, a case against the driver of a motor-car has been dismissed, and from the report which we publish on another page, it would appear that the complaining driver of a horse was more nervous than the animal itself. This is frequently the case. The idea that a horse will not face a motor-car gets into the head of a driver, and he dodges about in such a way that the animal gets restive and irritable—to the danger of all in his neighbourhood. We do not suggest that such happened in the Pershore case—in fact, no harm came to anyone—but drivers could often have more confidence in their horses to the advantage of horse and driver.

The Liverpool Self-Propelled Traffic Association's Run.

AS briefly mentioned in our last issue the Liverpool Self-propelled Traffic Association is organising an automobile meet and sixty miles run for Saturday the 9th prox. Mr. E. Shrapnell Smith, the hon. secretary of the association, has now sent us a programme of the outing, from which we learn that the run is to Knutsford *via* Chester and Delamere and back *via* Warrington. A start is to be made at Woodside, across the River Mersey, at 12.10 p.m., lunch to be taken at 1.30 p.m. at the Grosvenor Hotel, Chester. The journey to Knutsford will be resumed at 2.45 p.m., and at this interesting Cheshire resort

a halt for tea will be made. Leaving Knutsford at 5.15 p.m., Liverpool is expected to be reached at 7.30 p.m. In addition to the members' private cars which are expected to take part in the run, a limited number of automobiles will be provided for the convenience of members who do not as yet possess their own. Expert drivers will be in charge of these hired cars. The run will be open to ladies, and it is hoped that members will introduce friends who have private cars.

The Storage of Petroleum Spirit.

ON another page of the present issue we reproduce certain regulations, dated April 26th, 1900, made by the Secretary of State under section 5 of the Locomotives on Highways Act, 1896, as to the keeping and use of petroleum for the purposes of light locomotives, which have just been issued. In promulgating the regulations the Secretary of State for the Home Department desires to direct public attention to the dangers that may arise from the careless use of the more volatile descriptions of petroleum, commonly known as petroleum spirit. Not only is the vapour therefrom, which is given off at ordinary temperatures, capable of being easily ignited, but it is also capable, when mixed with air, of forming an explosive atmosphere. It is, therefore, necessary, in dealing with and handling the spirit, to take strict precautions by the employment of thoroughly sound and properly closed vessels and by avoiding the use of naked lights in dangerous proximity, to prevent leakage of the spirit and the contact of any form of artificial light with the highly inflammable vapour which it is always evolving. The regulations came into operation on the 15th inst., from which date the regulations dated November 3rd, 1896, were repealed.

The Gordon-Bennett Cup Race.

WILL the Gordon-Bennett Cup Race be decided this year in France after all? That is the all-absorbing question of the day, and the general opinion now appears to incline towards an affirmative answer to the question. Whatever may be the ultimate fate of the other road races it is thought in automobile circles that permission will be accorded for the holding of the international contest, and certain it is that the three defenders of the cup are already omitting no precautions to assure that their mounts will be in perfect condition for the *course*. No official news is so far forthcoming, but the impression exists among "A.C.F." members that the obstacles in the way of deciding the international race have been successfully overcome, and that the event will be decided on French soil. I believe, too, writes our Paris correspondent, that the Italian automobilists at Brescia have been in communication with the "A.C.F." as to the practicability of deciding the race in Italy if necessary, and suggesting as itinerary the route—Brescia, Padenà, Parma, Boulogne, Ferrare, Rovigo, Padoue, Vicenza, and Vécone. This route, however, only measures 414 kilomètres, and as cup rules stipulate for a distance of at least 550 kilomètres, a modification of the governing laws would be required before this itinerary could be accepted. As for the roads themselves, report states them to be excellent; whereas the routes between Turin and Milan, where a longer itinerary might be found, are too bad to permit of automobile

racing. However, it is to be hoped that the necessity will not arise for the race to be decided so far afield, and that the first contest for the Gordon-Bennett cup will be competed for in sunny France.

Newspapers Wanted.

AUTOMOBILISTS can serve the general interests of the new movement in two ways. Firstly by replying in the local papers to all criticisms on motor-cars and, secondly, by forwarding to our office copies of such journals containing depreciatory remarks on automobiles. A collection of the curious things that have been said against motor-cars would be interesting, instructive, and amusing.

Trouble at Bournemouth.

A PRETTY little quarrel is now going on at Bournemouth in which the Town Council is showing how it seeks to harass the inevitable. The Horse Committee of the Bournemouth Council has made a regulation that all motor-buses plying for hire between Pokesdown and Bournemouth must proceed to the County Gates under penalty of the revocation of the licence.

Writing to the chairman of the committee on the subject, Mr. F. J. Bell says, "The motor omnibuses between Pokesdown and Bournemouth most certainly do meet a public want. This is evidenced by the number of inhabitants who travel between these points. The motor omnibuses between the Square and County Gates do not meet a public want, as can be clearly seen by the practically entire absence of passengers. I am led to suppose the reason I am compelled to go to County Gates is

THE 1,000-MILE TRIAL. The three first arrivals at St. Albans—The Hon. C. S. Rolls's Panhard, Mr. Kennard's Napier, and the Ariel Tricycle with Whippet Trailer. (Mr. E. Kennard.)

caused by the action of the three Omnibus Companies, and I consider the Council should not be influenced by the threatened action of trade competitors." In the course of further correspondence Mr. Bell points out that he is prepared to run a number of motor-buses the additional distance to meet the actual needs of the case, but he protests against having to run all his buses a further distance when the traffic does not demand it. We learn that he is running his motor-cars between Pokesdown and the Square only, and we hope the Bournemouth Council will withdraw from the unreasonable attitude it has assumed.

The Lincoln Motor-Car Service.

THOSE who participated in the 1,000-mile Trial were pleasantly surprised to find so many motor-vehicles plying for hire in Lincoln. Certainly local enterprise is doing much for the automobile industry in the city, and the Lincoln Motor Bus Company is running cars from the Arboretum Gates to Carholme, from 8 a.m. to 10 p.m. In addition to this regular service the company is prepared to let cars on hire to private parties by the hour, half or whole day, and is also arranging organised trips to the Dukeries at fares including dinner, tea, etc. In this latter department there should be a good business, and motor-car proprietors elsewhere should try similar experiments in their own localities.

Some Trade Changes.

RUMOURS have been current in automobile circles for some weeks past that Mr. J. S. Critchley was severing his connection with the Daimler Motor Company. The rumour has proved to be correct, for this week official notification of the same has reached us, with the additional information that Mr. Critchley has taken up an appointment with the British Electric Traction Company, Limited, of Donington House, Norfolk Street, W.C. Another item of news which has come to hand this week is that Mr. Charles Jarrott, who lately resigned his position as the secretary of the British Motor Company, Limited, has been appointed manager of the De Dion-Bouton British and Colonial Syndicate, Limited, of 14, Regent Street, London, S.W. We wish both gentlemen every success in their new spheres.

A Motor-Car on Fire.

WITH such a headline have the papers in the Eastern Counties chronicled an incident which occurred in Norwich last week. It appears that one afternoon a motor-car engaged in conveying passengers between the Market Place and Thorpe arrived at Howlett's Corner, Norwich, and when the car stopped the driver observed smoke issuing from the driving apparatus. The smoke soon turned to flames, and had it not been for the quick application of water serious damage must have been done to the car. The outbreak was due to the overheating of the cylinder. And then, says our contemporary, the car, which was not seriously damaged, was led away. With such a small affair why give a somewhat sensational heading?

Another New Burns Car.

THE other day we had an opportunity of inspecting another new car which has lately been completed by Mr. J. Burns, of Berners Street, Oxford Street, London, W. The vehicle, which has seating accommodation for two persons, is propelled by a two-cylinder horizontal petroleum-spirit motor located in the front part of the frame. The ignition is electrical, while the cylinders are water-jacketed. There are several special features in the water circulation, which is maintained without the use of a pump. In fact, there is no water tank, a large cooling coil being employed instead, the coil consisting of no less than 55 ft. of Clarkson-Capel's 2 in. radiating tube. Two speeds forward—twelve and thirty miles per hour—are provided, as also a reverse motion, the latter being controlled by a foot pedal. The motor-shaft carries a pulley at each end, these being connected by belts to fast and loose pulleys on a countershaft at the rear, a single chain conveying the power to the back axle. Three brakes are available—one on the countershaft and one each on the hubs of the rear wheels. Wheel steering is provided; the car complete weighing about 12½ cwt. As to the hill-climbing capabilities of the car Mr. Burns tells us that it has been driven up Netherall Gardens, Finchley, where the gradient is one in eight, at a speed of eight miles per hour, with three persons aboard.

A Trade Directory.

THE new edition of Kelly's Merchants, Manufacturers, and Shippers Directory is rightly termed a guide to the export and import shipping and manufacturing industries of the world. We notice that the different customs tariffs are now arranged in one section instead of the geographical distributions adopted in previous additions. In the section relating to motor-car and carriage manufacturers there are entries relating to thirty firms in London, fifty-three in the provinces, and thirty-three in Paris, while directories for motor-car builders in Chicago, Genoa, Lille, Philadelphia, Stettin, Toronto, Vienna, etc., are also given. The director also gives lists of motor manufacturers in Eilenburg, Eric, Hamburg, Milan, Ober-Ursel, Orleans, San Francisco, etc.

Motor-Cars in Lakeland.

UNDER the title of the "Old and New" Sir Edwin Arnold chats pleasantly in the *Daily Telegraph* about the visit of the motor-cars to Westmoreland. The hills and valleys—"sanctuaries of ancient peace"—of the county were invaded, he says, by the new times. "The motor-cars came, sixty or seventy strong, through our valley, startling the ravens on Helm Crag, sending the black-legged ewes scudding with their lambs over Rydal Crag and Grey Fell, astonishing the simple shepherds of Seat Sandal, and drawing forth all the scanty population of these Westmoreland fells and dales, as if the blasts of their cars had been from so many magic horns from Fairyland. As they sped away through Grasmere and up the long slope of Dunmail Raise in a long and clamorous procession of electric, petrolic, and steamy fervours of speed, I felt a little bit glad my venerable and illustrious old friend, Mr. Ruskin, was sleeping too soundly at Conistone, beyond his astounded hills, to hear those novel echoes. The motor-cars vanished over the pass on their way to Carlisle and Scotland, and set me thinking of the other changes which had come over this lovely and placid valley, in which lie embedded a silver chain of lakes from Windermere to Thirlmere."

What "Madame" Says.

Madame may be an authority on ladies' attire and know a good deal about things feminine, but ere she ventures into matters automobilistic should have a lesson or two in accuracy. In the issue for May 19th appeared some photographs purporting to illustrate some of the vehicles engaged in the 1,000-mile Trial. One was the "Racing Vallee Motor-Car"; another "a Bollee voiturette and trailer," and a third "a Mors 8 h.p. dog cart." These, in addition to a Peugeot car carrying three ladies gazing at the camera instead of looking after themselves, and a "De La Haye" were included by our contemporary with photos of Mr. Rolls and some of the cars at Hounslow. If the photographs were misleading, what of the letterpress? "At the time of writing," remarked *Madame*, on May 19th, "the best car in the trial is undoubtedly the Panhard and Levassor. A car that will appeal to ladies is the 'Petit Duc' Mors motor-car. Mrs. Friswell drove this car part of the time. . . . The 8 horse-power Mors dog-cart, driven by Messrs. Bowen, acquitted itself very well in the trial. . . . The Delahaye car was running very well at the time of writing. A car that ladies will not like is the Racing Vallée. It certainly acted up to its reputation during the trial. Then there is a Bollée voiturette and trailer"—and more mistakes on the part of our contemporary which we will not republish.

Accuracy Wanted.

Now why does *Madame* imagine such things? Motoring has enough to encounter from enemies; it does not want intending friends to indulge in such muddles on its behalf, and we would suggest that before next seeking to interest automobilists in its columns it should obtain the services of someone who knows what he or she is writing about; or there is just a fear that its function will be limited to amusing motorists. There is a great deal of ignorance with regard to automobilism in connection with the Press, and the sooner accuracy is regarded as the first essential in such matters the better.

AMONG recent purchasers of Daimler cars are Mr. Alfred Ledger and Mr. John Dottridge, both of Blackheath.

APPLICATION has been made to the Park Commissioners for an exclusive twenty-five year franchise to operate motor-carriages and omnibuses in Golden Gate Park, San Francisco, United States, and connecting boulevards, at a stipulated rate of fares. The applicant is willing to assume all responsibility for accident, and in return for the concession agrees to pay 3 per cent. of the gross receipts for the first five years, 4 per cent. for the next ten years, and 5 per cent. during the remainder of the period of the franchise.

THE JOEL ELECTRIC CARRIAGE.

DURING the last seven years very great progress has been made with the practical application of electricity for carriage propulsion, and many difficulties have been met and overcome, as was the case with electric lighting in its early days. Electric lighting is now a success, and electric traction is making equal progress, as is proved by the many electric tramways and railways in use in different countries, and by the many types of electric carriages that can be seen in the streets. The principal improvements have been made in (1) the electric motors, which are now very efficient and reliable; (2) in the storage batteries, now made portable, of light weight, and capable of standing rough usage and hard wear and tear; and (3) carriages made with underframes for holding the motors, and specially built for motor propulsion, and also simplifying the controller

very simple, and there are good brakes, while should, from any unforeseen cause, one set of the batteries or one of the electric motors become damaged, the other set of batteries and the other motor can be used to drive the carriage.

This system allows, it is claimed, a much lighter construction and more elegant form of carriage to be used than has hitherto been available. The carriage runs easily without vibration or noise, at quick speeds. The electric motors are the invention of Mr. Henry F. Joel, A.M.I.C.E., and are each of 2 b.h.p. nominal. They work with 40 volts, run at 600 to 700 revolutions per minute, and weigh only 112 lb. Each will give 3 b.h.p., so that there is an available 6 b.h.p. to drive the carriage. The electric motors have been specially designed and constructed for carriage work, and are the result of many years of experience in making dynamos and motors. The armatures revolve outside the field magnets instead of inside as usual, and they act as fly-wheels to keep

FIG. 1.—GENERAL VIEW OF THE JOEL ELECTRIC CARRIAGE.

and connections—all to enable a man of ordinary intelligence to take charge and drive the carriage.

Our illustration (Fig. 1) shows one of the latest forms of electric carriage, constructed on the system and patents owned by the National Motor Carriage Syndicate, of 37, Walbrook, London, E.C. There are two small electric motors driving the two back wheels of the carriage by ordinary link bicycle chains acting directly from a small sprocket pinion on the motor axle to a larger sprocket wheel fixed to the spokes of the carriage wheel, these chains being adjustable as in a bicycle. The motors are fixed on an independent and "springy" underframe, and as each drive separately there is no necessity for balance gear. Two sets of batteries drive these motors; they are placed out of sight half under the front seat and half under the back seat, thus distributing their weight. The steering and electric controlling are

the motion of the carriage steady. The field magnets of these electric motors have twelve poles in opposite pairs, N.S. N.S., arranged to interspace equally round a circle in the plane of their outer diameter, and are turned true to fit close inside and under the armature core. A central wire magnet coil is enclosed by the iron of the field magnets on three sides, and thus the utmost effect of the current in the wire coils is utilised.

The winding of the armature is exceedingly simple. Short pieces of square insulated copper wire, all of exactly equal length and resistance, are passed through holes in the iron core of the armature; they are then bent obliquely and connected by the shortest possible path one to the other at the side of the armature, to form a zigzag winding, crossing the armature as many times in one complete coil as there are poles on the field magnets, and when completed they form symmetrical flanges round the

sides of the armature, with a minimum of non-active wire, an equal resistance in each coil, and little or no windage when revolving. The short pieces of wire can be easily taken out and replaced.

The advantages claimed for this armature are:—A maximum proportion of the winding is effective in induction and a minimum

FIG. 2.—THE JOEL ELECTRIC MOTOR.

absorbed in ineffective connections. This enables the motor to be of comparatively light weight and high efficiency owing to the small waste in connections between the operative parts of the winding. The armature, which in other electric motors is usually the most delicate part, is in this motor very strong, simple in construction, proof against accidents, and will bear overloading 100 per cent.—this last being a most important feature. The illustration (Fig. 2) shows one of these electric motors with the armature outside and the field magnets inside. The axle carrying both the armature and field magnet is fixed at the front and back in a peculiar shaped cradle frame; the armature revolves on one long bearing, and the magnets are fixed to this axle.

The whole construction of the motor is unique, and has, the makers state, proved to be particularly well adapted for use on vehicles. The motors are completely encased when in use, and run either way, backwards or forwards, without sparking or giving the slightest trouble. The following short table gives the result of a test of a 2-h.p. nominal Joel motor, showing efficiencies at different powers—Speed, 650 to 700 revolutions; current, 40 volts; weight, 112 lb.:

1	b.h.p., efficiency 70 per cent.	...	$\frac{1}{2}$ power.
$1\frac{1}{2}$	" " 77 "		
2	" " 85 "	...	Nominal and average power used in carriage.
$2\frac{1}{2}$	" " 87 "		
3	" " 89½ to 90 per cent.		

The two motors are carried by a special independent underframe, as shown in Figs. 3 and 4. This underframe is made of steel tubes, *T T*, to form a rectangular frame fixed by half elliptic carriage springs, *S S*, to the front and back axles, *X X*, of the carriage wheels, *W W*, thus forming a "perch pole" and giving a direct drive to the carriage wheels. The front spring of this frame is arranged horizontally, and fixed at the centre to the front axle; the back spring is vertical, and fixed to the centre of the back axle. Complete freedom of movement is thus obtained without strain to the underframe.

The motors, *M M*, are easily fixed to the underframe by the lugs on the side of the cradle frame. The chain gear, *C C*, connecting the two motors to the wheels, as shown, are put in line

and adjusted for length by long-threaded screw pins, *P P*, and double nuts fixing the underframe to the vertical back spring. This underframe gives great facility for adapting electric propulsion, and can be fixed to any carriage. It is claimed to be resilient and to prevent any shock or jar when starting or stopping, and being independent of the carriage body any vibration at the motors is not communicated to the carriage. It also safeguards the motors from concussion when the carriage is passing over rough ground. When the electric current is put on the whole frame with the motors is at first lifted up a little against the back spring, and as the carriage moves off the whole frame returns to its normal position; thus the first rush of current is partly avoided, as the armatures start at once, and, in addition, the weight of the motors in returning to their normal position assists the carriage to move off quietly and without jar.

The batteries, "Rosenthal" type, are made up in portable sets of ten cells in a tray, or forty cells in all. They weigh 22 lb. each cell complete, and the total weight with trays is about 8½ cwt. They give 20 amperes discharge for seven hours, and will stand a discharge of 40 amperes without harm. The plates are of the pasted type, with special provision for expansion. They are enclosed in perforated cases, and are clamped together by rubber bands. These cells after six years of experience in practical use have been found to be very efficient and durable under the rough usage they have to stand in motor-carriages, and they are said not to deteriorate or sulphate when out of use. The working efficiency output of these cells is high, being 12 watt hours per lb. of complete cell, and 16 watt-hours per lb. of electrodes.

The illustration (Fig. 5) shows a set of nine cells of this type of battery, in a tray complete, ready for use. These trays measure 13½ in. wide, 23 in. long, and 11 in. high, and being portable are easily put in or taken out of the carriage. Simple rubber nozzles are attached to each cell and act as valves.

FIG. 3.—ELEVATION OF JOEL ELECTRIC CAR.

FIG. 4.—PLAN OF JOEL UNDERFRAME.

An electric commutating controller of very simple construction, the result of many experiments and trials in actual use, gives the carriage five speeds forward, viz.:—3, 6, 8, 10, and 12 miles per hour, and one speed of 3 miles per hour backwards. The handle of this controller is arranged to be moved forward for going "forward," and *vice versa*. The controller is also

arranged to couple up the four trays of the batteries in series for charging at 100 volts without loss. The variation in speed is obtained by: 1st. Batteries in parallel, motor armatures in series, 3 miles. 2nd. Batteries in parallel, motor armatures in parallel, 6 miles at full power for hill climbing. 3rd. Batteries in parallel, motor armatures in parallel varying power of fields, 8, 10, and 12 miles per hour.

The field magnet coils are separately excited, and can be altered at will. This has the advantage that the motors can be used as brakes, and the normal speed of the carriage of 12 miles per hour can be increased if desired to 20 miles per hour.

The carriage will run for 50 miles with one charge on good roads. The weight of the carriage, fitted with motors, batteries, etc., is about 17 cwt. We understand that the syndicate are also making special light carriages, "voiturettes," to carry two people for fifty to eighty miles, weighing only 11 to 12 cwt. Mechanical band brakes are fitted for use in addition to the electrical brakes.

FIG. 5.

The carriage shown in Fig. 1 has been run some hundreds of miles through different parts of this country and on the Continent. One test was a run from London to Potter's Bar, up Highgate Hill, Finchley Hill, and Barnet Hill; another test was from Dover Harbour to the heights above Dover. The wheels in this carriage are 3ft. diameter, with solid rubber tires. The wheel track is 4ft. 6in. with 5ft. 6in. base, and the gear used is a Renold chain with gearing of 8 to 1. The current required for hard level roads with three passengers is 30 ampères, or 15 ampères for each battery at 40 volts, giving a full 1½-h.p. to the carriage at the speed of twelve miles an hour. When ascending inclines of 1 in 30 the current rises to 40 ampères, or 20 ampères each battery, and on inclines of 1 in 20 to 60 ampères, or 30 ampères each battery. In the voiturette made by the syndicate the wheels are 2ft. 9in. diameter back, and 2ft. 6in. diameter front: front track 3ft., back track 4ft. 6in., base 4ft. 6in. The voiturette is fitted with two 1-h.p. nominal motors, and a battery of thirty-two cells, weighing 7 cwt., coupled as in the carriage described in the foregoing. The wheels, however, have "Grappler" pneumatic tires, with roller bearings, and the whole carriage is exceedingly light and easy going. There is comfortable room for two, with a front seat. In this carriage the electric current required for propulsion is much less in proportion for the same weight than the carriage illustrated, 10 ampères only for each battery on hard level roads, and being a lighter carriage it will travel twice the distance, and go much faster for the amount of electric energy required for the heavier type of carriage. The carriages, motors, batteries, etc., are made for the syndicate by Messrs. Henry F. Joel and Co., 31, Wilson Street, Finsbury Square, London, E.C.

THE Moto-Club Anversoïis has just been formed at Antwerp with M. Dupont as first president.

MAFEKING DAY AT THE CRYSTAL PALACE.

ON Saturday last the dispersal of the cars taking part in the great 1,000-mile Trial of the Automobile Club took place at the Crystal Palace, where they had been on exhibition throughout the week. It was certainly a happy notion to bring the proceedings in connection with the Trial to a conclusion at the national playground at Sydenham, and throughout the days succeeding the arrival in London the cars were subjected to the examination of the expert and the curiosity of the curious. Thus they helped to further public interest in automobilism, and amongst the visitors were many from the provinces who had seen the cars while *en route*.

In the morning of Saturday the vehicles were weighed in the vicinity of the Palace by desire of the judges, being pushed out of the building before their burners were lit or petrol tanks filled—a prohibition insisted on by the authorities; and some amusement was frequently caused among the onlookers at the spectacle of enthusiastic motorists thus sending their cars into the North Gardens, where they were got ready for going of their own accord into the other parts of the grounds, where, on Saturday, they demonstrated their capacity for speed and their responsiveness to control.

In the afternoon an automobile fête was held and great was the gathering of club members and their friends, whose practical sympathy for Lady Georgiana Curzon's Mafeking Relief Fund was quickened by the news that had sent all London delirious with joy. During the earlier part of the afternoon seats on the vehicles were obtainable for one shilling; and later tickets were freely sold at half-a-crown, the most prominent cars in the recent Trial naturally attracting many passengers and securing large accessions to the Fund. While an animated scene was thus in progress around the bandstand on the Terrace—where Mr. C. Johnson had arranged a temporary box office—the scene within the Palace was more demonstrative, and groups of visitors, not content with the parading of flags, the blowing of whistles and the rattling of even noisier instruments, were so far favourable to automobilism as to utilise the hooters of some of the few cars then remaining in the building, for giving vent to their feelings. The sounds were certainly striking, if the combination was somewhat unmusical.

Among the vehicles which were driven along the terrace and into a portion of the grounds for the benefit of the Fund were the Hon. C. S. Rolls' 12 h.p. Panhard, the Hon. J. Scott Montagu's 12-h.p. Daimler, Mr. J. A. Holder's 12-h.p. Daimler, Mr. Edward Kennard's 8-h.p. Napier, and Mr. Mark Mayhew's 8-h.p. Panhard, as well as several of the vehicles entered by various manufacturers. To name all who were present would be an invidious task; suffice it to say that the automobile world was fully represented, and although the attendance of the public at the closing scene may not have been extraordinarily great it was certainly large enough to warrant the arrangement of such a *finale*.

At the conclusion of the visit to the Crystal Palace many of the cars were driven back to town and some were sent in procession through the streets of the West End, where they were associated with the popular pleasure at the news of Mafeking's relief. Throughout Saturday evening great crowds of people walked the thoroughfares around the West End and the horse-drawn carriages with occupants carrying flags were received with enthusiasm. But even greater was the welcome given the automobilists, who not only were thus able to contribute their quota to the general rejoicing, but also to demonstrate a new advantage that the automobile has over horses. It is not alarmed at crowds and shows no concern at such startling noises as were heard in the streets on Saturday. Such a motor-car progress is to be welcomed as adding another point in favour of our movement; and thus the events connected with the close of the Trial were able to emphasize the lessons that have been taught all the way on the long pilgrimage which is now a matter of automobile history.

1,000-MILE TRIAL INCIDENTS.

THE Trial should draw the attention of British spring and axle makers to the future that lies before them in the automobile industry.

IN the list of cars arriving at Newcastle we inadvertently omitted that of Mr. T. B. Browne, No. 3, which was fifth into the city on the Tyne.

THOSE of the Lincoln local committee who went on the cars as far as Newark returned to the city on two cars lent by the Lincoln Motor Bus Company.

AS the vehicles passed through Thirsk a hiring fair was in progress, and similar festivities were being indulged in at Leicester when the cars drew up at the Bell Inn.

A LARGE number of people waiting at Barnet to see the arrival of the cars engaged in the 1,000-mile Trial were disappointed — as the route lay through Elstree, a rather doubtful advantage.

AMONG the many cars seen at Lincoln was a neat-looking Billings voiturette which had been driven over from Gainsborough by Mr. H. W. Bamber, of Messrs. Baines and Sons, Limited, Gainsborough.

MRS. KENNARD draws our attention to two printer's errors in her article on "The Small Fry of the Trial," in our last issue. On line 20 the word "deeper" should be "steeper," and on line 52 "around" should read "crowned."

ACCORDING to a Woburn journal, the tire of one of the motor-vehicles burst as it passed through that village on the last day of the Trial, and "the explosion was heard a long distance, and many thought it was the report of a cannon."

IT is satisfactory to find a number of newspapers remarking that if the 1,000-mile Trial has done nothing more than demonstrate the wonderful control and facile conduct of self-propelled vehicles, a great result may be said to have been achieved.

AS Mr. F. H. Butler, the hon. treasurer of the Automobile Club, was pulling up at his door in Pall Mall, after his successful Trial, a horse attached to a carriage took fright at the motor-vehicle and damaged itself so badly that it had to be shot.

CAPTAIN LANGRISHE and Mr. Shrapnell Smith effected quite a smart repair to the pump on Mr. Harmsworth's Parisian Daimler during the course of the journey from Sheffield to Nottingham.

ham. Short of a washer, one was improvised out of a halfpenny piece.

AS the result of the local exhibitions in connection with the 1,000-mile Trial the following sums have already been handed to the War Fund:—Bristol, £25; Cheltenham, £32 18s.; Carlisle, £33 19s. 5d.; Kendal, £12 12s. Total to date, £105 9s. 5d.

AS an instance of the scrupulous care that was taken from the first by the promoters of the Trial to provide against accident, it may be mentioned incidentally that a note from the Chief Constable of Newark, drawing attention to the possibility of vehicles and caravans being on the road owing to the nearness of Newark Fair, was given special prominence in the programme.

ONE of the most stylish-looking vehicles at the Sheffield exhibition was the private carriage of Mr. E. P. Reynolds. The car is of the Daimler type, the body having been built in Sheffield under Mr. Reynolds's personal supervision, and in appearance it approximates as nearly to the really slightly automobile as anything that the genius of the manufacturer, English or Continental, has yet attained.

THE MOTOR MANUFACTURING CO.'S 6 H.P. PANHARD PHAETON—NO. 8 IN THE 1,000-MILE TRIAL.

THE voiturette referred to in our report as having been towed by Mr. Moffat Ford was No. 14. It had had pump troubles, and Mr. Egerton happened to be with it at the time, rendering assistance. Hence the reference to the vehicle as that driven by him. As a matter of fact, the De Dion voiturette No. 15, driven by him, never required extraneous assistance and

never fell below the twelve miles average speed.

TO be run over by one's own car is rather an unusual incident, but this is what happened to Mr. Grierson, who drove a De Dion voiturette on the journey from Sheffield to Nottingham. Applying the brakes somewhat suddenly, and getting up at the same time, with the intention of giving chase to some boys who had made themselves a nuisance, Mr. Grierson was thrown out in front of the car, the wheels of which went over his leg, fortunately without any serious result.

WE have it on good authority that the Beeston Motor Works at Coventry have been purchased by a chocolate and cocoa firm. In regard to the Beeston cycle factory negotiations are still proceeding with one of the leading motor houses.

A MEMBER of the Automobile Club states that the police in Norfolk and Cambridgeshire are in the habit of marking off distances on the road and using stop watches with a view to, if possible, proving that an automobilist has travelled at a speed in excess of the legal limit. Members of the Club would do well to bear this in mind in connection with the forthcoming Whitsuntide Tour.

AUTOMOBILE FETE AT VINCENNES.

(From our own Correspondent.)

IT was on Sunday afternoon last that the Vincennes annexe of the Paris Exhibition gave its first real signs of life, for hitherto the chaste assembly of unfinished buildings, unaided by any outside attractions, has quite failed to secure any attention from the general public. But on Sunday conditions were wonderfully different. Not that the Exhibition buildings or the installation of the various stands had undergone any remarkable advance; indeed, they presented a melancholy spectacle of incompleteness and unattractiveness little likely to account for the huge influx of visitors. No, the public had not journeyed all the way to Vincennes to see the so-called Exhibition, but to witness the first of those fêtes which the Auto-

with spectators, who scanned with interest each car as it appeared upon the scene. And I can assure you there were a few to scan. They seemed to be numberless, and ranged in size from the diminutive voiturette to the huge steam omnibus. And they brought with them all the celebrities of the automobile world. There the Baron de Zuylen, on a 12 h.p. blue-painted Panhard; there M. Georges Lemaître on a Peugeot voiturette, M. Mors on a dog-cart, M. Santos-Dumont on a Stanley electric, Comte de Dion, MM. G. Rives, Michelin, Avigdor, Archdéacon, Renault, Bardon, Richard, Forestier, A. Ballif, Pierre Lafitte, Krieger, Paul Rousseau, de Diétrich, Georges Prade, Thévin, and a thousand others. Quickly the grand stand filled, and when at last a start was made with the programme hardly a vacant place was to be seen. The seat of honour was occupied by Mr. Alfred Picard, the commissioner-general of the Exhibition, and he was supported by many high

SNAPSHOTS OF THE CARS AT VINCENNES.

mobile Club of France is this year organising to take place on the road running round the Lac Daumesnil. Certain it is that no sport has a greater hold upon Parisians than automobilism, and in providing a series of fêtes and competitions the Exhibition Commissioners knew full well that they were adopting the best possible means to attract visitors to Vincennes. For without the certain knowledge that excellent sport is to be seen, but few people would take the trouble to make that tedious journey to and from the annexe, especially on a Sunday, when every means of transport is crowded to excess. But last Sunday all were assured of good sport, for was not the programme in the hands of those two well-known organisers, MM. Jeantaud and Ravenez, and accordingly everyone set out from Paris with perfect tranquillity. Proceedings were timed to commence at 2.30 p.m., but half an hour before that the roped-in road running round the Lac Daumesnil was lined

officials, in addition to the leading members of the A.C.F. But the personage whose presence sent a thrill of pleasure through every motor-man at Vincennes last Sunday afternoon was M. Lépine, the Préfet of Police, under whose personal direction the precautions for the public's safety were carried out. Here was the opportunity of *chauffeurs* to demonstrate to M. Lépine how perfectly under control were their vehicles, and I am bound to say that the drivers rose to the occasion and displayed a skill and discretion worthy of all praise. Not a mishap, even of the most trivial character, occurred to mar the afternoon's proceedings, and M. Lépine could not but be favourably impressed with the practical demonstration thus offered to him. The officials, undoubtedly, had this object in view when they directed that each vehicle should be driven up before the stand at a great rate of speed and then suddenly stopped. Their confidence, both in the drivers and in the machines, was not misplaced, for vehicle

after vehicle was pulled up in the most startling manner, the displays made by Madame Gobron on her beautiful Gobron-Brillie car and M. Dominique Lumberjack mounted on an Amédée-Bollée being particularly noteworthy. This item was perhaps the most interesting on the programme, at any rate to those intimately in touch with automobilism, but the gymkhana events also excited much attention. There was an egg race, a needle race, apron and skittle races, competitions with buckets, handkerchiefs, rings, and obstacles, indeed, all that could be devised to amuse the spectators and give the competitors a chance of showing their skill. As is usually the case in programmes of this nature, the Decauville drivers and cars showed to great advantage, some of the evolutions made by them being simply astounding. Then came a game of alleged polo, but it bore no resemblance to any game that I have ever seen, for some half-dozen large balls were in use at the same time and the players were absolutely indifferent as to the direction in which they smote these balls. Everybody having won, a sort of triumphal march of a snaky nature was indulged in by all the voiturettes engaged in the fray, and then a start was made with the *défilé général*. Considerably over two hundred vehicles participated in this promenade, lead by the Baron de Zuylen. And what a truly marvellous collection of types—racers and tourists, steam and electric, wagonettes and dog-carts, cycles and voiturettes, omnibuses and drays, all gaily decorated, and sporting the dainty commemorative banners handed to them. It was a sight to gladden the heart of a motor-man, even if he was afoot and smothered in the dust swept up and deposited upon him by his self-propelled friends. And in the midst there suddenly arrived, unannounced and all forlorn, a post-office cart drawn by one of those curious animals now rapidly becoming extinct—a horse. He walked soberly and majestically along the track, until, before the grand stand, his progress was arrested a moment while a commemorative banner was solemnly handed to his driver, and then he resumed his stately march, unheeding the shouts of laughter which greeted him on every side, and ignoring equally the rush and clatter of his mechanical rivals. Good old gee-gee, you are not such a bad sort after all! With the *défilé* proceedings terminated, and those of us unblest with cars—and I suppose that we numbered some ten thousand dusty mortals—set out for Paris, where we ultimately arrived, having made the four miles in about seventy minutes, thanks to the surpassing rapidity of the horse-drawn trams. A more inaccessible spot than Vincennes could hardly have been selected within the environs of Paris, but then every-one is presumably supposed to motor there.

THE Automobile Patents Exploitation Company has been formed at Trenton, N.J., with a capital of £200,000.

At his coach-building warehouse at Southampton Mr. R. Andrew is showing a motor-car by the side of a phaeton bearing the date 1790.

MR. F. G. BARTON, 11, George Street, Oxford, stocks Messrs. Carless Capel's petrol and can supply automobilists passing through the University city.

A FEW weeks ago the *Grocer* contained an article on motor-cars, and a correspondent of that contemporary now asks where he can buy a motor-lorry to carry one and a-half tons.

MR. C. CLIFFORD POTIER, of Sutton, has been appointed sole agent for Surrey for the Ariel Motor Company, Limited, and also sole agent for the counties of Surrey, Sussex, and Kent for the Components Cycle Manufacturing Company's motor-cycles and parts.

A COMMITTEE meeting of the Motor Trades Association was held on the 18th inst. at the Holborn Viaduct Hotel, when much detail work connected with trade matters was got through. Mr. Chandler, the secretary of the Association of Cycle Accessory Manufacturers, attended to explain the objects of his Association, and it is possible that the Motor Trades Association will eventually adopt a similar plan of operations. It was decided in future that committee meetings should regularly be held on the second Friday in each month.

THE AUTOMOBILE CLUB'S WHITSUNTIDE TOUR.

THE Whitsuntide tour of the Automobile Club has now been definitely decided upon, the route selected being to Peterborough, Norwich, and Cambridge, and the dates fixed upon Friday, June 1st, to Tuesday, June 5th. The following is the official programme:—

FRIDAY, 1ST JUNE.

	Miles.	Miles.
10 a.m. Depart from Horse Guards' Avenue via Pall Mall, St. James's Street, Piccadilly, through Hyde Park to Marble Arch, Edgware Road, Elstree, St. Albans	23	23
Harpden, Luton, Claphill, and lunch at Bedford (Swan Hotel)	30	53
3.30 p.m. Leave Bedford for Eaton Seccon Norman Cross	10½	63½
and Peterborough	21	84½
	7	91½

Sleep at Peterborough.

SATURDAY, 2ND JUNE.

11 a.m. Depart from Peterborough via Wisbech and lunch at King's Lynn (Duke's Hall)	21½	21½
3 p.m. Leave Lynn via Saxham and East Dereham to Norwich	13½	35½
	43½	78½
or (alternative) via Hunstanton	15½	50½
Burnham Deepdale, Wells, Cromer	39½	89
Aylsham and Norwich	22½	111½

Sleep at Norwich on Saturday and Sunday nights.

MONDAY, 4TH JUNE.

11 a.m. Depart from Norwich via Thetford and lunch at Bury St. Edmunds (Suffolk Hotel)	29	29
3.30 p.m. Depart from Bury St. Edmunds via Newmarket to Cambridge	12	41
	27½	63½
or (alternative):—		
9 a.m. from Norwich to Yarmouth	23	23
to Lowestoft	10½	33½
to Beccles and Bungay	16	49½
and Bury St. Edmunds	36½	86
and (after lunch) via Newmarket to Cambridge	27½	113½

Sleep at Cambridge:—

TUESDAY, 5TH JUNE.

11 a.m. Leave Cambridge via Royston, Baldoek	13½	13½
Stevenage, and lunch at Hatfield	8½	22
3.30 p.m. Leave Hatfield for Barnet	11½	33½
Finchley, Child's Hill, Finchley Road, Avenue Road, enter Outer Circle of Regent's Park by gate opposite Baptists' College, Park Crescent, Portland Place, Regent Street to Club	9	42½
	13½	56

The committee will endeavour to secure seats in club vehicles for members and their friends, provided that applications are received sufficiently early.

AN interesting chat with Sir David Salomons recently appeared in *Cassell's Saturday Journal*.

THE Darlington Rural Council has decided to draw up and present to the Chancellor of the Exchequer a petition in favour of a tax on cycles and motor-cars.

A COMPANY has just been formed in Paris (3, Rue Scribe), with a capital of £50,000, to be known as La Société Générale de Constructions de Voitures Automobiles.

THE Monarch Motor Company, Limited, has been registered with a capital of £250,000, to adopt and carry into effect an agreement expressed to be made between E. Jessuran of the one part and this company of the other part; and, generally, to carry on business as electricians and electrical engineers; as importers and exporters, manufacturers of and dealers in, as principals or agents, of oil motors, gas motors, for automobile or other purposes in the United Kingdom or elsewhere; as general manufacturers of gas and oil engines, etc.

THE MOTOR-CAR INDUSTRY PAST AND PRESENT.

—8—

AT a meeting of the Institution of Junior Engineers, held at the Westminster Palace Hotel, on Friday, May 18th, a paper was read by Mr. Charles H. E. Rush and Mr. Basil H. Joy, entitled, "A short Review of the Motor-Car Industry, Past and Present." The authors pointed out that the shortness of time at their disposal for the reading of a paper obliged them to confine themselves to a description of oil-driven vehicles only, other systems being only briefly alluded to. The enormous advantages to be gained by using motor instead of horse-drawn vehicles were summarised as follows:—1. Economy in working. 2. Increased possibilities in speed. 3. Greater safety. 4. Infinitely greater radius of action. 5. Humanity. 6. Economy in road repairs. 7. Cleanliness in streets. 8. Increased volume of trade. 9. Fewer unemployed. It was shown how restrictive legislation had hampered progress in the industry under consideration and given our Continental rivals a great lead over us. In comparing the merits of the various motive powers which can be employed, compressed air and gas were not considered, but steam was shown to have many advantages which for heavy haulage made it supreme; electricity, except for very limited purposes, was regarded as impracticable at the present time, while oil, or rather petroleum spirit, in spite of its many disadvantages, was shown to be the motive power for light tradesmen's vans and all light vehicles where long distances were to be covered.

The action and construction of the Daimler motor were then described in great detail, together with its application to a motor-vehicle, illustrated by diagrams, and an excellent full-size section model of a motor and gear box lent by the Daimler Company. The method of governing was referred to, and its complication pointed out. A new and very simple form was illustrated, in which the working parts are reduced to one, and it was stated that it had given great satisfaction on a car which had run some 300 miles. The De Dion and Benz motors were then described, and the reversing arrangement of the latter fully treated. The question of ignition was next dealt with, the three methods, tube, electric, and magneto-electric, being fully described. Preference was given to the first-named, as giving on the whole the least trouble. The various methods which can be employed for transmitting the power from the motor to the countershaft, and the different devices by which is overcome the difficulty of obtaining variations of speed in a motor vehicle fitted with a motor in which the speed is not variable, were described. It was shown that the question of steering was not quite such an easy matter as might appear at first sight, but difficulties had been overcome by the Ackermann, and again by the more geometrically perfect Davies' gears; other forms were briefly referred to, together with various methods of reversing.

Spray and surface carburettors were then described and compared, preference being shown for the former as requiring less adjustment of the mixture when running. The importance of an efficient method of keeping the cylinder-heads cool was touched upon, and the Cannstatt-Daimler cooler, which it was mentioned

was very much on the lines of a marine condenser, was described as being about the most efficient now on the market, the evaporation being practically nil; its weight and cost, however, were great. It was noted that air cooling is successfully adopted for small-powered motors up to $2\frac{1}{2}$ —3 h.p. The disadvantages, amounting almost to dangers, of the ordinary hand-brake were referred to and illustrated by experiences on the recent 1,000-mile Trial, in which they failed to hold vehicles from running backward down hill, and it was suggested that the expansion or internal hand-brake would meet this objection. The desirability of pneumatic tires for motor-vehicles was urged, and a brief reference made to the various forms of wheels used on such vehicles. The authors concluded by stating that they had only been able to touch upon a few of the better-known forms of vehicles now on the market, but that there were many others which might be considered equally as good, though not so well known.

By way of an appendix some quotations were made from a paper read by Professor H. S. Hele-Shaw, Hon. M.Inst.I.E., before the Institution of Mechanical Engineers on the same subject, and the conclusions to be drawn from the recent 1,000-mile Trial organised by the Automobile Club were tabulated, showing that the English 6 h.p. Daimler cars are fully equal to the French

6 h.p. Panhard cars; that the French pneumatic tires are better than the English; that even small 3 h.p. voitures can be depended upon to do such long distances as one thousand miles, that the dangers prophesied for running a large number of vehicles at high speeds on the public roads have proved to be non-existent, owing to the wonderful control under which they are at all times. An animated discussion ensued, in which Messrs. P. Marshall, Loftus Perkins, A. Tingle, G. C. Allingham, L. F. Awde, S. Boulding, A. C. Kent,

G. Gentry, A. K. Smith, E. Shrapnell Smith, T. Meacock, W. J. Tennant, and E. A. Berry took part.

THE Cheltenham Rural District Council has unanimously decided to recommend the taxation of motor-vehicles at the rate of £1 1s. per annum.

SIR DAVID SALOMONS has been appointed by the French Government a member of the jury in the class "Automobilism," at the Paris Universal Exhibition.

THE Norwegian Government is reported to have just placed a contract with Messrs. Cudell and Company, of Aix-la-Chapelle, for a motor-car to carry two persons and to haul mitrailleuses and munitions.

THE Automobile Club of America is organising a run from New York to Philadelphia for June 2nd. The start will be made from the Waldorf-Astoria at 7.30 a.m. Dates for other runs have been chosen as follows: June 16th, Bernardsville, N.J.; June 30th, Asbury Park.

THE British Motor Traction Company, Limited, has been registered by A. S. Ramskill, 40, Holborn Viaduct, E.C., with a capital of £100 in £1 shares, to carry on the business of tramway constructors and proprietors, steam, oil, electrical, and other motor manufacturers, cycle makers, etc. Registered without articles of association.

GENERAL VIEW OF THE JACKSON DOCTOR'S CAR. (For description, see page 110, ante.)

MOTOR-CARS ON THE CONTINENT.

The Swiss Automobile Club's Race.

It is not only the French promoters of automobile races who are made to suffer by the authorities' interdiction of motor events, but also several foreign organisations, who had planned holding *courses* wholly or partially on French territory. The Swiss Automobile Club, for example, has been obliged to give up its eagerly anticipated race from Geneva to Aix-les-Bains, and propose to replace it by a *course* entirely on native soil. The itinerary of this event has not yet been selected, but the trend of opinion among club members appears to favour the adoption of a very hilly route, which should not be difficult to find in that land of mountains. Personally, I do not believe a mountainous itinerary to be a desirable feature in an automobile race, but it is possible that the "A.C.S." propose to make the *course* a series of hill-climbing competitions.

Le Critérium des Voiturettes.

THURSDAY, the 17th inst., was the date selected by the proprietors of *Le Vélo* for their second annual "Critérium des Voiturettes" over the Etampes-Chartres route, and if only from a weather point of view, the selection proved to be a happy one. The race is popular with constructors and drivers of voiturettes, for the road is a most excellent one and is, moreover, singularly free from traffic. Entries, however, were not very numerous, but any lack in this respect was more than compensated for by the class of the competing vehicles, which was truly representative of France's best voiturettes. Two categories had been provided, the one for those vehicles not exceeding 250 kilos. in weight, and the other for the cars weighing up to 400 kilos. The actual starters in the first category were seven in number, these being—Tart, weight of car, 195 kilos.; G. Richard, 237 kilos.; Maudiquet, 246 kilos.; Gallet-Itasse, 249 kilos.; Marcel Renault, 250 kilos.; Louis Renault, 250 kilos.; Demester, 248 kilos. In the second classification the following dozen com-

THE HANZER VOITURE. (For description, see page 108, ante.)

At the Parc des Princes.

A SLAUGHTERING of records occurred on Sunday afternoon at the Parc des Princes, and although the majority of the new figures were made in the ordinary cycling events, still there was one remarkable motor-cycle performance. That came from Béconnais—needless to say—and was made over a distance of twenty kilomètres, the time achieved being all the more remarkable from the fact that no less than ten competitors actually engaged in the race. These were—Béconnais, Vasseur, Demester, Henri Loste, Bertin, Garin, Fossier, Rigal, Cabaillot and Ariès. Upon the signal to start being given, Bertin at once took the lead, but quickly lost it to Béconnais, who was never again headed. Demester, too, secured a considerable advance of the other competitors, but the battle for the third place was long and stubborn; Vasseur and Fossier being close together throughout the event. Béconnais covered ten kilomètres in 8min. 28sec., and untroubled by any untoward circumstance, he completed the full distance of twenty kilomètres in 16min. 47sec., beating the previous record, which also stood to his credit, by 32½sec. Demester finished second, Vasseur and Fossier third and fourth in the order given.

petitors lined up at the start:—Mercier—weight of car, 370 kilos.; Van Berendonck, 284 kilos.; M. Echalié, 260 kilos.; Fernandez, 309 kilos.; De la Roëre, 293 kilos.; Huguet, 270 kilos.; Coltereau, 399 kilos.; Ravenez, 380 kilos.; Théry, 392 kilos.; Chabrière, 398 kilos.; Ullmann, 316 kilos.; Fram, 333 kilos. Hitherto the 100 kilomètre races decided on this road have been run from Etampes to Chartres and return, but in order to avoid even the slightest possibility of protestation the promoters changed the itinerary completely, and the *course* of the 17th instant was decided over a distance of 25 kilomètres covered four times, thus necessitating the negotiation of the three turnings instead of one as formerly. Previous to following the performances of the small cars, however, I must refer to Béconnais' startling achievement, which will always be inseparably connected with the Critérium des Voiturettes of 1900. It will be remembered that the previous week this famous *chauffeur* had only succeeded in securing a third place in the motor-cycle race over the Etampes-Chartres route, and doubtless the fact rankled in his mind. So then on the 17th instant Béconnais set out at two o'clock precisely, to take advantage of the precautions provided for the competitors in the voiturette race. At Ablis, which marked the outward limit, Béconnais made his first turn, having

accomplished the 25 kilomètres in 18min., and when he reached Etampes his time for the half-journey (50 kilomètres) was 40 min. The second round was accomplished in practically the same time, and the total distance of 100 kilomètres was covered by Béconnais in 78 min. 54 sec. And this with three turns! The previous best time for the distance was 82 min. 34 sec., made by Béconnais on the Arles-Salon road on the occasion of the Salon meet this year. But to our voiturettes, who, without being able to travel quite so fast, are, as will be seen below, quite capable of making pretty speedy performances. Started at one minute intervals, no incident or mishap marred the departure, and upon the completion of the first round Cottereau had secured a substantial lead from Théry, the other men well to the front being Chabrière, Demester, Mercier, and Marcel Renault. Cottereau's time was 51 min. 49 sec., a performance all the more remarkable, as after the first 27 kilomètres he had been running with a back axle damaged to such an extent that one wheel wobbled in a terribly dangerous manner. Not one of the many experts who saw him complete the first round had any faith in his accomplishing the complete journey, but in this they were wrong, for not only did he finish, but he finished first. His time was 1h. 44min. 57 $\frac{3}{4}$ sec., beating Théry's 100 kilomètre record by 3min. Cottereau's voiturette is fitted with a four-cylinder motor, and on the level is capable of travelling at some 65 kilomètres per hour. The final classification was as follows:—Voiturettes of from 250 to 400 kilos.—1, Cottereau, 1h. 44min. 57 $\frac{3}{4}$ sec.; 2, Théry, 1h. 50min. 18 $\frac{3}{4}$ sec.; 3, Chabrière, 2h. 9min. 32sec.; 4, Mercier, 2h. 21min. 0 $\frac{3}{4}$ sec.; 5, Echalié, 2h. 27min. 14 $\frac{3}{4}$ sec.; 6, Ravenez, 2h. 28min. 41sec.; 7, Fernandez, 2h. 34min. 20sec.; 8, Ullmann, 2h. 41min. 24 $\frac{1}{2}$ sec.; 9, Van Berendonck, 2h. 41min. 33sec.; 10, De la Roëre, 3h. 6min. Voiturettes weighing less than 250 kilos.—1, Tart, 2h. 12min. 31sec.; 2, Marcel Renault, 2h. 16min. 36 $\frac{1}{2}$ sec.; 3, Demester, 2h. 20min. 52 $\frac{3}{4}$ sec.; 4, L. Renault, 2h. 24min. 47sec.; 5, G. Richard, 3h. 27min.; 6, Maudiquet, 4h. 6min. Out of the nineteen starters there, sixteen finished the course, the three delinquents being Gallet-Itasse, Huguët, and Fram. There is little doubt that the voiturette of to-day is rapidly approaching in reliability and regularity of running its larger brethren, and that the fragile machines of six months ago are as rapidly disappearing.

Racing in Germany.

THE race between Eisenach, Oberhof, Meiningen, and Eisenach, promoted by the Central German Automobile Club, was duly run off on the 6th inst. There were nine starters, the winner being Herr Tischbein, whose time for the journey of 140 kilomètres was 4h. 23min. The route, it should be mentioned, was a very hilly one. On Sunday, the 13th inst., a race was also run off between Mannheim, Pforzheim, and back, under the auspices of the Mid-European Motor-Car Union. The distance (168 kilomètres) was covered by the winner, Herr Benz, in 3h. 56m.

Racing at Vienna.

ON the well-known Praeter track at Vienna there took place last Sunday three motor-cycle races, rendered of particular interest by the presence of the two famous French *chauffeurs*, Marcellin and Gasté. A large number of spectators, among whom were very many members of the Austrian Automobile Club, witnessed the racing, and upon the conclusion of the meet accorded the French representatives a perfect ovation. The first event was one of 1,000 mètres, and this Gasté won, making the distance in 56 $\frac{3}{4}$ sec. Then followed a 5,000 metre race, and here Marcellin proved the victor, his time being 4 min. 34 $\frac{1}{4}$ sec. The third trial took place over a distance of 10,000 mètres, and Marcellin again scored a victory, completing the journey in 8 min. 8 $\frac{3}{4}$ sec., this beating the previous best made on Austrian soil.

A MEETING of the Anglo-French Association is to be held at the Café Monico to-night, the 26th inst., when Sir David Salomons, Bart., will read a paper on the Automobile Industry. The meeting will commence at 8.30 p.m., Mr. Roger Wallace, Q.C., taking the chair.

LECTURES ON AUTOMOBILISM.

ALL who have attended the discussions at the Automobile Club know Mr. Shrapnell Smith, the honorary secretary of the Liverpool Propelled Traffic Association, as one of the most attractive speakers who take part in those gatherings. As a lecturer he should be equally acceptable, and the announcement that he is willing to lecture on "Motor-Cars: Past, Present, and Future" will be regarded with pleasure by many of our readers. The lecture will be illustrated with one hundred lantern illustrations, and the following syllabus gives an idea of the popular character of the lecture:—

Past.—Introductory—Early Experiments—Cugnot—Murdoch—Trevithick—Carriages with legs—James—Gurney—Hancock—Steam Omnibuses in London—Maceroni and the Parisians—The Pre-Victorian Steam-coaching Period—Legislation—Tolls and Capitalists—The Early Sixties—Evading the Law—Thompson's Tires—The "Man-with-the-Red-Flag" Act—The First Motor-tricycle—The French Races—Sir David Salomon's Action—Revival of Interest in England.

Present.—Oil, or internal combustion, vehicles—Steam, or external combustion, vehicles—Electric vehicles—The Liverpool Heavy Vehicle Trials—The 1,000-mile Trial of the Automobile Club.

Future.—Extinction of the Horse—Accidents—Control of Traffic—Damage to Roads—Effect upon existing interests—Economy of use—Perfection of Communication—General Aspects.

Mr. Shrapnell Smith's address is, The Royal Institution, Liverpool.

THE meet of the Automobile Club which had been arranged to take place at the Hurlingham Club to-day, the 26th inst., has been abandoned, the space being too limited to hold a satisfactory show of automobiles.

WE hear that Mr. John A. Brodie, M.Inst.C.E., one of the vice-presidents of the Liverpool Self-Propelled Traffic Association, has just purchased a "Locomobile" steam-car. Mr. Brodie left London on Saturday last with his new vehicle, intending to drive to Liverpool by road. Professor Hele-Shaw, another vice-president of the association, has given his preference to petrol, for we understand that he has placed an order with Messrs. Burford, Van Toll and Co., of Twickenham, for a New Orleans voiturette.

REAR VIEW OF JACKSON DOCTOR'S CAR, WITH BODY REMOVED.
(For description, see page 110, ante.)

THE "MAYFAIR" VOITURETTE.

THE accompanying illustration shows the little petroleum-spirit car which the Sports Motor-Car Company, whose temporary address is 45, Esmond Road, Kilburn, is introducing into this country, and which will be known as the "Mayfair" voiturette. The vehicle, which is said to be the result of fifteen years' experience, is fitted with a 3½-h.p. motor of the well-known "Abeille" type, has electric ignition, water circulation, pump and radiator in front, live axle, and strong

steel tube frame. The differential gear is of a new form and is enclosed in an aluminium case, doing away with chain gearing. The steering is of the wheel type, the driver sitting on the right.

A SALE by auction of a number of motor-cars, including several belonging to Prince d'Arenberg, was held in Paris on Saturday last.

THE United States Long Distance Automobile Company has been formed in New Jersey with a capital of £200,000. The company's headquarters are at Lewis Nixon's Crescent Shipyard, Elizabeth port, N.J.

"THE Automobile Wagon for Heavy Duty" is the title of a paper read at a meeting of the American Society of Mechanical Engineers just held at Cincinnati. The author was Mr. Arthur Herschmann, mechanical engineer to the Adams Express Company of New York.

THERE is a funny man on the staff of the *Globe*, who writes that "a motor-car enthusiast describes the great interest exhibited by a group of M.P.'s in a new car bought by one of the members. It was provided with a new and beautiful front piece, which is described as a 'cow-catcher.' We shall hear next of a three-acre turf-turf or a political vote-catcher."

WE regret to learn of the death of Mr. E. J. Walkley, which took place on Sunday last, at the age of 42, after a long illness. The deceased, an old racing cyclist, was an enthusiastic automobilist, and a director of Messrs. Hewetsons, Limited. His last motor ride was in connection with the Motor-Car Club's run to Brighton, in November last.

THE *Aberdeen Express* states that Banchory is about to secure the advantage of a motor-car service. A company has been formed, the aim of which is to provide a cheap and quick method of transport to the railway at Banchory through the valley of Strachan and Birse. The directors of the company propose to run for hire motor-vehicles for pleasure and business, and also for trade delivery and transport purposes in connection with the trains at Banchory Station through Strachan and Birse to the Sawmill, Finzean.

CORRESPONDENCE.

JOURNALISTIC CONTRADICTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that the impressive *County Gentleman* has been getting wroth over the 1,000-mile Trial of the Automobile Club, and referring to Mr. Graham White's achievement on the run from Edinburgh to Newcastle, duly recorded in your columns, says that "motor-car maniacs are wild with laudatory enthusiasm" over the matter. This will be news to many of the "maniacs" who, without going into "laudatory enthusiasm" or any other peculiar condition, are nevertheless conscious of the fact that Mr. White proved that difficulties do not deter automobilists. So far as the London journals are concerned the great majority have recognised the sanity of those who drive motor-cars and also the advantages of the latter over horse-drawn vehicles. Only the *County Gentleman* is considerably behind the times and violent in his wrath. I hope, however, this is only a temporary aberration and no permanent malady. In fact, a return to saner ideas is already evident, for, after penning the above, I came across a later article in the same journal which, while contradictory to the spirit of the first paragraph, is satisfactory reading. It is a general conclusion of the results of the recent Trial and is as follows:—"No one can deny that the results of the 1,000-mile trial of motor-cars were in many respects highly satisfactory. The main object of the Automobile Club, who organised the Trial, was not to determine the number of miles that could be covered in a certain time—not a test of speed—but to demonstrate that the motor-car, even though it is still comparatively in the initial stage of development, is a safe, a reliable, and an economical means of locomotion. To a certain extent the members of the Automobile Club have succeeded in attaining their object. In the future, at all events, the British public will be less likely to regard the motor-car as a fad, and more ready to grant that it is an article of utility, that it has come to stay, and that it has wide possibilities before it."

Yours truly,

X.

York, May 22nd, 1900.

MOTOR-CARS WANTED AT KIDDERMINSTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Another industry has discovered that the railway companies are not always so careful of the interests of the traders as the latter consider they ought to be. At a meeting of the Kidderminster Chamber of Commerce the president, Mr. J. H. Pearse, referred to the very unsatisfactory train service of the Great Western Railway Company. Mr. Tomkinson urged that it would well be worth consideration to have a motor-vehicle service between Kidderminster and Bromsgrove and the Midland Railway Company's system. Personally he was inclined to have a motor-car to run to Bromsgrove. There was, he thought, no reason why carpet manufacturers should not adopt motor-cars with success, as the millers of the locality have done. I would suggest that, in view of this discussion, the firms engaged in the motor-car trade should send particulars of their cars to the carpet manufacturers of the Kidderminster district.

Yours faithfully,

A TRADER.

Birmingham, May 21st, 1900.

THE seven principal French railway companies and the Ceinture Railway Company of Paris have agreed under certain conditions to accept automobiles as passengers' luggage. The regulations stipulate that, provided their dimensions allow of their being put in the luggage van, vehicles of all kinds, including motor-cycles and automobile carriages, will be accepted, but the weight must not exceed 150 kilogrammes when the vehicles are unpacked, and 100 kilogrammes when packed. Presumably the reduced weight allowed when the vehicle is packed is due to the lessened mobility of the same.

ELECTRIC IGNITION FOR PETROLEUM-SPIRIT MOTORS.

IN the early days of gas and petrol engine construction, the only method of ignition was by what was commonly known as the incandescent tube. The tube which entered the combustion chamber or cylinder is heated to redness by a gas or petrol burner, which necessitated the maintaining of an open flame outside the engine cylinder. The many dangers accompanying this form of ignition, especially on petrol engines, made it in some localities extremely hazardous, together with the uncertainty in the period in which the ignition would actually take place due to high or low compression. Under favourable conditions, such as tight-fitting cylinder rings on the piston head and perfect fitting valves, whereby high compression was obtained and the explosive mixture forced into the hot tube to a point where the tube was at an igniting temperature, the ignition would take place at a proper period of the stroke, and high efficiency was the result.

When the opposite condition existed, such as a slight leakage at the rings on the piston head or in the valve seats, low compression existed, causing a loss in power. This, together with the frequent breakage of the hot tubes due to the oxidation and other uncertainties of this method soon led inventors and manufacturers of gas and petrol engines to seek a more reliable means of ignition, free from the many dangers accompanying the use of the hot tube. This was found in electric ignition. Yet many builders of gas and petrol engines have frequently met with difficulties, and sometimes failure, in their efforts to obtain satisfactory results with electric ignition under the various conditions.

This is due to the many details which are overlooked and regarded by many builders as unimportant. The great strides that have been made in the perfection of the petrol motor, especially as adapted for automobile service, are due in great measure to the improvement made in electric igniters, spark coils, and batteries. Perfect ignition is the most important factor in producing successful results. Engines having igniters that combine durability with simplicity have met with the greatest success in the hands of the average operator.

Another leading feature is the cost of maintenance. The writer will endeavour to explain what he regards as the most successful igniting devices in use at the present time. They consist of two distinct classes—the primary and the secondary, commonly called the jump spark igniter. The primary igniters, which are by far the most largely used by the motor builders in America, are constructed in three distinct forms. The first are known as the striking or make and break contact points, which are made to pass through the side of the cylinder or through the cylinder head into the combustion chamber. The movable point, which strikes against the stationary point, is actuated by a suitable mechanism on the outside of the cylinder. This mechanism is usually so arranged that ignition can be produced at the highest point of compression, or at the point where the highest efficiency is obtained with the combustible mixture contained in the chamber.

The second form of primary ignition, commonly known as the rotary or wipe spark igniter, is not so largely used as the

striking or make-and-break type just described. One objectionable feature that the writer has not yet seen successfully overcome in the rotary type is the great wear in the sliding contact points. It is true this form of ignition produces a much larger spark with the same consumption of battery power than the striking or make-and-break igniter, but the frequent attention that this form of sliding contact ignition requires to keep it in perfect condition will prevent it from ever becoming as popular as the striking or make-and-break ignition.

The third form of primary ignition used in this make-and-break igniter is known as the inside igniter. This igniter is constructed by passing the insulated stationary rod through the side wall of the cylinder, or through the cylinder head. The movable part of this igniter is attached to the piston head inside of the cylinder, and when the piston head compresses the explosive mixture to the highest point of compression the igniter, which had been brought in contact by the forward motion of the piston, is separated by the movement of the piston head, thereby igniting the mixture. There are many other forms of primary ignition in use, but those described above are the most largely used in America.

The second class of igniters, commonly known as the jump spark igniters, have only one form of construction. This is an insulated plug through which the wires from the induction or secondary coil pass to the inside of the combustion chamber. The two wires which pass through the insulated plug are usually spaced from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. in passing through the plug, and curved inward or toward each other to allow from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. air space through which the spark passes from the positive to the negative wire. It will be noticed that no movable parts exist in this form of ignition. When the battery is closed by suitable insulating plates on the revolving shaft of the engine, a spark is produced in the combustion chamber or cylinder.

The insulating plugs used for this secondary current, or jump spark ignition, must necessarily have very high insulating properties. They are usually made of lava, which is a composition of soapstone, or made from mica, which has high insulating properties. The Ruhmkorff or induction coil, as it is sometimes called, which is used to produce the jump spark, is constructed with a primary coil of coarse or heavy wire having a soft iron core. Over the primary coil are wound a great many layers of very fine, insulated copper wire having no metallic connection with the wires of the primary battery coil.

When a battery current passes through a primary coil it magnetises the iron wire core, and also charges the tin foil condenser, which is usually placed in the base of the coil. When the battery circuit is closed a current of very high voltage is produced by the induction in the secondary coil, the ends of which terminate in the ignition plug inside the combustion chamber. This high voltage causes a spark to pass from the positive to the negative wire inside the combustion chamber.

To ignite the charge in a motor successfully with any of the above forms of ignition a battery of great strength and durability is absolutely essential, and is by far the most economical to use. These requirements are only found in a closed circuit battery that is manufactured expressly for high-speed engines. Practical tests and demonstrations on automobile motors have

GENERAL VIEW OF THE GLADIATOR VOITURETTE.—No. 16 IN THE 1,000-MILE TRIAL.

proved a battery having from $4\frac{1}{2}$ to 6 volts, or $\frac{3}{4}$ to 1 volt per cell, to be the correct voltage to use. The battery should have a very low internal resistance, and have an amperage or current discharge of from 8 to 16 amperes on closed circuit measurement.

Too much cannot be said about the use of a suitable primary spark coil in connection with any of the primary igniters. It has required many tests to determine the correct resistance to have in the coil. If the resistance is too low, the coil will allow too large a flow of current from the battery, thus wasting very much of the battery power; also frequently destroying the platinum points on the igniter. To obtain the best results, from $1\frac{1}{2}$ to 2 amperes should be the limit of discharge through the coil. Coils are now wound for four, six, and eight cells, as the case may be.

Since the early days of electric ignition many forms of spark coils have been used—in fact, any coil that would produce a large spark was considered the correct coil to use, irrespective of the great waste in battery power. Many spark coils in use to-day are wasting as much current as is required to successfully ignite the charge. This is due to the very low resistance of the spark coil, which allows twice the amperage or current to flow through the coil when the circuit is closed as is necessary for successful ignition. This waste of current is prevented by having the correct resistance in the coil, so as to produce a reliable spark and prevent any waste in the battery power. It has been found from actual tests on modern engines that by having a coil of the correct resistance the life of the battery has been doubled.

Another great improvement in ignition and saving in battery power was effected by discarding the old style long coils, which were 8, 10, and 12 in. in length (an erroneous idea existed that a long coil would produce a larger spark). Practical experience and tests have shown that a primary spark coil best suited for high speed engines, such as used on automobiles, should not exceed 6 in. in length over all. The 8, 10, and 12 in. coils will not, with the same consumption of battery power, magnetise and demagnetise as rapidly and completely as the 6 in. coil; consequently, the latest improved primary coil has an extra large diameter core, which is composed of No. 20 annealed Swedish iron wire, re-annealed after cutting to 6 in. in length. A coil having a core made of this grade of iron and with this degree of care will magnetise and demagnetise instantaneously. This enables the engine builders to provide for only a short duration of close—that is, allowing the circuit to remain closed only half as long as would be required to produce the same results with an 8, 10, or 12 in. coil. It is therefore a great economy in battery power to use a 6 in. coil, and the results are much more satisfactory.

Another important feature in the construction of primary spark coils for automobile use is the thorough waterproofing of the spark coil to produce thorough insulation under all conditions met with in use. No spark coil, if not proof against dampness and moisture, will give satisfactory service for any period of time; it is, therefore, necessary to have the coil thoroughly waterproof.

No form of dry battery should be used for continuous use. All dry batteries and sal ammoniac batteries are open circuit batteries, and only suitable for periodical work. The first cost of a dry battery and sal ammoniac battery is very low, but its life in heavy service is very short. Dry batteries are sometimes used for starting an engine where a dynamo is used for continuous ignition. A number of builders are using dry batteries for starting their motors, and as soon as the required maximum speed is obtained an automatic switch cuts the battery out of the circuit and closes the dynamo circuit. This is also sometimes accomplished with a two-point switch, and the dynamo will then ignite the charge until the speed is reduced. While the dynamo or generator is used, the batteries are at rest.

The writer considers a good portable closed-circuit battery not only more economical than the dry battery and dynamo combination, but it requires less care, as there are fewer parts to become disarranged in the rough service to which ignition devices are subjected in automobiles.

Many builders of vehicle motors have had difficulties, no doubt, with the many forms of closed-circuit batteries. These

difficulties are sometimes easily located. A closed-circuit battery in which a paraffin oil must be used on the solution should be avoided, as it will be found to give short life and comparatively poor service. This is due to the rough usage in carriages causing the paraffin oil to coat the elements and interfere with the action of the battery. A perfectly sealed or liquid-tight battery does not require any oil to protect the solution from the atmosphere. A battery which may show excellent service in stationary use may be a complete failure in portable use.

There are no trade secrets about electric ignition. The degree of success that the various manufacturers are meeting with depends entirely upon the amount of attention that has been given to the most important details, which the writer has endeavoured to explain in this article. There are perhaps other causes for success or failure in electric ignition, but those referred to are from the writer's personal experience and observations made in the past ten years, or since the development and perfection of the gas engine in the United States.—By P. P. Nungesser in the *Horseless Age*.

AN automobile club has just been formed at Geneva, Switzerland. Steps are also being taken to form a club at Barcelona, Spain.

THE Dresden Gas-Motoren Fabrik Gesellschaft (Moritz Hille), of Dresden, reports a profit of £72,065 for 1899, which admits of a dividend of 10 per cent.

THE Crest Manufacturing Company, of Dorchester, Mass., U.S.A., whose Duplex petrol motor has been illustrated in these columns, have just brought out a new vertical air-cooled motor. Regulation is effected in the usual way by varying the ignition time, and speed can be varied from 200 to 2,000 revolutions per minute. All the working parts are of tool steel, hardened and ground; the wearing surfaces are large, and no adjustment of any kind is needed. Specially large radiating surfaces are provided, as also special through-bolts, which hold the cylinder head, cylinder, and crank case in place. In a letter to us the Crest Company state that: "We have not decided on its rated horse-power, but we can assure you that the motor is not only of ample horse-power for tricycles and quadricycles, but it will be satisfactory for very light types of automobiles."

FRONT VIEW OF DAIMLER CAR, WITH BODY AND BONNET REMOVED.

THE BRITISH AND COLONIAL VOITURETTE MOTOR.

THE other day we had an opportunity of inspecting a new petroleum-spirit motor and rear axle, adapted for light voituresses, which is being introduced into this country by the British and Colonial Motor-Car Company, Limited, of 38, Snow Hill, E.C. The motor, which is provided with a water-jacketed cylinder and electrical ignition, develops slightly over 3 h.p. when running at 3,000 revs. per minute. It is provided with an external fly-wheel, the crank shaft working in an oil-containing case. The inlet and exhaust valves are arranged one on each side of the cylinder, the sparking plug, which can be readily removed, being fitted in the top of the explosion chamber. Another feature to which attention may be drawn is the adoption of roller bearings to all the working parts of the engine. As will be seen from the accompanying illustration, the motor is located centrally, and drives the rear axle direct by spur gearing. Two speeds are available, the gear wheels being always in mesh, they being so arranged that any one of the two pairs can be made to transmit the power. A friction clutch is also provided, so that the motor can be instantly cut out from the transmission gear. The variable gear, as also the differential, is entirely enclosed in the central oil-contain-

ing case seen in the illustration; ball-bearings are employed in connection with the axle. The British and Colonial Motor-Car Company have introduced this combination set of motor and rear axle with the view of meeting the wants of the many firms up and down the country which are anxious to go into the motor industry. We have also inspected a light three-seated experimental car fitted with a motor and gear of the type above referred to. It has a frame of tubular construction, spring suspended on the axles, and a device whereby the motor can be set in operation without it being necessary for the driver to dismount from his seat. The little car, which weighs between 6 and 7 cwt., can attain a speed of sixteen miles per hour, and is said to run quietly and with but little vibration. Mr. Adams, the managing director of the company, tells us that they have just opened a large depot at 11, Baker Street, London, W., for the sale of motors and vehicles, and that in addition to the 3-h.p. engine above alluded to, they hope shortly to be able to supply motors of larger size ranging up to 8-h.p.

LA SOCIETE EUROPEENNE D'AUTOMOBILES, of Brussels, which has a capital of £40,000, reports a profit of £24,000 for 1899.

THE Acting Secretary of the U.S. Treasury has ruled that an automobile is not free of import duty as a personal effect, but is free of duty as a household effect if used abroad by the owner one year or more.

THE STORAGE OF PETROLEUM SPIRIT.

THE following is a copy of the new regulations with regard to the storage of petroleum spirit which have just been issued by the Secretary of State for the Home Department.

Regulations dated April 26, 1900, made by the Secretary of State under Section 5 of the Locomotives on Highways Act, 1896, as to the keeping and use of petroleum for the purposes of light locomotives.

REGULATIONS.—By virtue of the powers conferred on me by the Fifth Section of the Locomotives on Highways Act, 1896, I hereby make the following regulations for the keeping and use of petroleum for the purposes of light locomotives. Save as herein provided the provisions of the Petroleum Acts shall apply to all petroleum kept or used or sold for the purposes of light locomotives. In these regulations the expression "petroleum spirit" shall mean the petroleum to which the Petroleum Act, 1871, applies, provided that when any petroleum other than that to which the Petroleum Act, 1871, applies, is on or in any light locomotive, or is being conveyed or kept in any place on or in which there is also present any petroleum spirit as above defined, the whole of such petroleum shall be deemed to be petroleum spirit. In these regulations the expression "storehouse" shall mean any room, building, coachhouse, lean-to, or other place in which petroleum spirit for the purposes of light locomotives is kept in pursuance of these regulations.

1. These regulations shall apply only to petroleum spirit which is kept for the purpose of or is being used on light locomotives, and shall not apply to petroleum spirit which is kept for sale and partly for the purposes of light locomotives.

2. Petroleum spirit shall not be kept, used, or conveyed except in metal vessels so substantially constructed as not to be liable, except under circumstances of gross negligence or extraordinary accident, to be broken or become defective or insecure. Every such vessel shall be so constructed and maintained that no leakage, whether of liquid or vapour, can take place therefrom.

3. Every such vessel, not forming part of a light locomotive, when used for conveying or keeping petroleum spirit shall bear the words "petroleum spirit highly inflammable" legibly and indelibly stamped or marked thereon, or on a metallic or enamelled label attached thereto, and shall be of a capacity not exceeding two gallons.

4. Before repairs are done to any such vessel, that vessel shall, as far as practicable, be cleaned by the removal of all petroleum spirit and of all dangerous vapours derived from the same.

5. Where a storehouse forms part of, or is attached to, another building, and where the intervening floor or partition is of an unsubstantial or highly inflammable character, or has an opening therein, the whole of such building shall be deemed to be the storehouse, and no portion of such storehouse shall be used as a dwelling or as a place where persons assemble. A storehouse shall have a separate entrance from the open air distinct from that of any dwelling or building in which persons assemble.

6. Every storehouse shall be thoroughly ventilated.

7. The amount of petroleum spirit to be kept in any one storehouse, whether or not upon light locomotives, shall not exceed sixty gallons at any one time.

8. Where two or more storehouses are in the same occupation and are situated within twenty feet of one another, they shall for the purposes of these regulations be assumed to be one and the same storehouse, and the maximum amount of petroleum spirit prescribed in the foregoing regulation shall be the maximum to be kept in all such storehouses taken together. When two or more storehouses in the same occupation are distant more than twenty feet from one another, the maximum amount shall apply to each storehouse.

9. Any person who keeps petroleum spirit in a storehouse which is situated within twenty feet of any other building whether or not in his occupation, or of any timber stack or other inflammable goods not owned by him, shall give notice to the local authority under the Petroleum Acts for the district in which he is keeping such petroleum spirit, that he is so keeping petroleum spirit, and shall renew such notice in the month of January in each year during the continuance of such keeping, and shall permit any duly authorised officer of the local authority to inspect such petroleum spirit at any reasonable time. This regulation shall not apply to petroleum spirit kept under licence, nor to petroleum spirit kept in a tank forming part of a light locomotive.

10. The filling or replenishing of a vessel with petroleum spirit shall not be carried on, nor shall the contents of any such vessel be exposed in the presence of fire or artificial light, except a light of such construction, position, or character, as not to be liable to ignite any inflammable vapour arising from such spirit, and no artificial light shall be brought within dangerous proximity of the place where any vessel containing petroleum spirit is being kept.

11. In the case of all petroleum spirit kept or conveyed for the purpose of or in connection with any light locomotive, (a) all due precautions shall be taken for the prevention of accidents by fire or explosion, and for the prevention of unauthorised persons having access to any petroleum spirit kept or conveyed, and to the vessels containing or intended to contain, or having actually contained the same; and (b) every person managing or employed on or in connection with any light locomotive shall abstain from every act whatever which tends to cause fire or explosion, and which is not reasonably necessary, and shall prevent any other person from committing such act.

12. These regulations shall come into operation on the 15th day of May, 1900, from which date the regulations dated 3rd November, 1896, are hereby repealed.

M. W. RIDLEY,
One of Her Majesty's Principal
Secretaries of State.
Whitehall, S.W.,
26th April, 1900.

FURIOUS DRIVING CASE.

MR. CHARLES FRISWELL, of Holborn Viaduct, and Mr. Oswald Edward Lord, of Bartholomew's Hospital, appeared at the Bow Street (London) Police Court on the 17th inst., to summonses charging them with furiously driving their motor-cars in High Holborn on the evening of April 21st. P.C. 433 E said that he saw the defendants travelling at the rate of sixteen miles an hour, and scattering people in all directions. He called upon them to stop, but, though they slowed down, they would not stop until the constable on duty, at the corner of Southampton Row, hearing the whistle, stopped the traffic. The defendants asserted that the gear on their machines would not permit of such a speed as sixteen miles an hour, and Mr. Friswell said he was following a Bayswater bus, and talking to the conductor when he was stopped. Two constables, however, corroborated the previous evidence, and Mr. Marsham fined each defendant 10s., and 2s. costs.

SEQUEL TO A MOTOR-CAR ACCIDENT.

At Edinburgh last week Sheriff Macdonochie fixed proof in an action for damages raised by William M'iver, coachman, 9, Hope Street, North Leith, against the Edinburgh Autocar Company (Limited). The amount claimed is £100. The pursuer avers that on March 27th last, while he was driving a carriage in Lothian Road in a southerly direction, and when opposite Grindlay Street, was run into by a motor-car driven by a servant of the defendants named Collins. The pursuer was violently thrown from the box to the street, and sustained a severe shock, from the effects of which he has not yet recovered, and was severely bruised in the body, and it will be some weeks before he will be able to resume his vocation. The driver, Collins, who was in charge of the motor-car, was convicted in Edinburgh Police Court for having recklessly and carelessly driven the car, and a fine of £5 imposed. The defenders deny that the accident occurred through the fault of their driver. The car was proceeding at the rate of not more than four miles an hour, and if the driver of the carriage had exercised ordinary care he could have avoided the collision. They also deny that the motor-car was on the wrong side of the street, and with regard to the conviction in the Police Court the defence is that Collins pleaded not guilty, and that the case was prejudiced by the absence of one of his witnesses, but admitting liability, the defenders offer the sum of £25 in full of the pursuer's claims.

STOPPING WHEN ASKED.

At the Pershore Petty Sessions last week, before General Davies (Chairman), Colonel Stringer, and Mr. C. Whitaker, Ralph Fort, 19, Queen Street, Oxford, was charged, under the Locomotive Highway Order, with refusing to stop when asked. Mr. T. Mallam (Oxford) defended. Defendant was driver of a motor-car. William Dee, Woollass-hill, said he was riding to Eckington on the 25th April, and met a motor-car. The horse became restive. He asked the driver to stop the car, but he refused, and told witness to go back to the corner while the car passed. By General Davies: The car was not going very fast, about eight miles an hour. Ann Cross said she saw the car going along the road, and Mr. Dee could not get his horse to pass. The car did not stop at all. She saw Mr. Dee put up his hand for the car to stop. Charles Osborne, Eekington, said he heard Mr. Dee call to the driver to stop. Mr. Dee had to go back into a side road while the car passed. Mr. Fort, Oxford, said he drove the motor-car 120 miles on the day in question. He saw complainant coming along the road. The horse was very restive. He at once stopped the car and put the back motion on, in case the horse should come toward him, as he could then go backwards. Fred. Jarner, Birmingham, corroborated, and said he persuaded Mr. Dee to go back to the side road, which was about twenty yards from where they met Mr. Dee. They gave Mr. Dee every opportunity to pass. Mrs. Fort corroborated her husband's statements. Seymour Fort, son of Charles Fort, said he thought the rider was more frightened than the horse. The Bench thought Mr. Fort a very competent and careful driver, and that Mr. Dee had every opportunity to pass without danger. The case was dismissed.

THE EARL OF CARNARVON AND HIS MOTOR-CAR.

THE Earl of Carnarvon, who is High Steward of the Borough of Newbury, and whose Hampshire seat, Highclere Castle, is but a few miles distant, was summoned by the police superintendent of that town for driving his motor-car at a greater speed than was reasonable or proper, having regard to the traffic on the highway, and to the common danger of the public, on May 5th. The hearing took place on Friday, the 18th, at the Newbury Borough Police Court. The Earl did not put in appearance, but was legally represented by Mr. F. Tuckett Louch. A technical objection was first raised as to the wording of the summons, but this was over-ruled, and evidence was called. Police Constable Pounds said on Saturday evening, May 5th, at 7.40, he was in Bartholomew Street, and saw Lord Carnarvon pass on his

motor-car. The car went by like a flash of lightning, and before he could put up his hand to stop it the car had disappeared in a cloud of dust. The pace was from 20 to 25 miles an hour. There were a good many people about in the streets, mostly on the pavements, but there were no vehicles. In cross-examination the constable said he had never ridden on a motor-car, but was a cyclist, and judged pace accordingly. It took about a minute for the car to travel 400 yards. Further pressed to give an exact statement as to the pace, he said it was excessive. Mr. Rawlings, relieving officer, said the car was going at a very rapid rate, and whilst he and the constable were crossing the street it passed out of sight in a cloud of dust. He saw women and children running to get out of the way. Mr. Henry Higgs said the car was going at twenty miles an hour, as far as he could judge, and it bounded over the bridge. He had never seen a motor-car going so fast, and he had seen a good many. This being the case for the prosecution, Mr. Louch asked if he had any case to answer. He submitted that a motor-car came under the definition of a carriage in the Highways Act, under which proof must be given of injury, interruption, or personal danger to any person travelling on the highway. In two cases upon which he relied, *Hills v. Somerset* and *Stenson v. Brown*, it was held on appeal that there could be no offence unless proof were given of injury, interruption, or personal danger. No such evidence had been given in this case, and the only statement made on the point was that women and children were seen to run out of the way. But none of these had been produced, and therefore he submitted that there was no case to answer. The Bench expressed a desire to hear witnesses for the defence. Alderman Benjamin Smith said he saw Lord Carnarvon's car pass, but it was not travelling faster than other motors he had seen pass, and he did not think it was going faster than it ought. He did not see it "bound" over the bridge, and there was nobody in the street endangered or interrupted. There was nothing in the speed to attract his attention, and certainly it was not fast, having regard to the traffic about. Dr. Marcus Johnson said he was on the car with Lord Carnarvon, who was driving. They passed between two or three vehicles, and Lord Carnarvon was very careful. They were going at about six or seven miles an hour, and nobody showed any signs of danger or held up their hands to them to stop. He had driven and ridden horses faster in the same street. He had travelled many times on the car with Lord Carnarvon, and considered him a very careful driver. The women ran more to see the car than to get out of its way. It was impossible for the car to progress by leaps and bounds: had it done so they would have been all thrown out. Mr. Louch explained to the Bench that the cloud of dust was caused by the heated air being forced out on the road, which caused the dust more than the action of the wheels. The Bench, after a short deliberation in private, unanimously decided to dismiss the case.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, JUNE 2, 1900.

[No. 65.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Whitsuntide tour of the Automobile Club is now in progress. Leaving London on the 1st inst. the party reaches Peterborough on the first day; on the 2nd inst. progress will be made as far as Norwich; and Sunday will be spent in the fine old city of narrow and winding lanes as well as of historic associations and pleasant surroundings. Then on Monday the journey will be resumed to Cambridge alternative routes *via* Bury St. Edmunds and Yarmouth having been thoughtfully suggested by the organisers.

On Tuesday the return to town will take place *via* Royston and the road along which the Commercial Efficiency Trials of 1899 were conducted. After lunch at Hatfield the last stage will be run *via* Barnet and Finchley to the club-house.

The Road to St. Albans.

OUR remark that it was a rather doubtful advantage for the route of the 1,000-mile Trial to terminate into London by way of Elstree has called forth a letter from a correspondent, who says the suggestion echoes the opinion that has been expressed by a great many. He expresses surprise that the route to Peterborough for the Whitsuntide tour is also *via* Elstree, and declares the persistent shunning of the Great North Road to be a matter of mystery. While the road is narrow and tortuous for such a large procession of vehicles as entered London recently, the objection to such a route is removed on the outward journey, so far as members of the Automobile Club are concerned, by its convenience to those leaving the club's premises and the generally good condition of the road. At the same time we are glad to see that during the present tour opportunity is given for club members to have experience of both routes.

The Manchester Automobile Club.

WE learn that the first run of the season of the members of the Manchester Automobile Club was held on Saturday last, the 26th ult. The members, after a run from Manchester, met for dinner at the George Hotel, Knutsford. The weather was everything that could be desired, so that there was nothing to detract from the success of this first outing. The cars taking part left Knutsford for home about 8.30.

Motor Racing at the Crystal Palace.

IN our last issue we gave an outline of the motor-cycle races which are to be held on the Crystal Palace track on Monday next, under the auspices of the Motor-Car Club. We learn that Mr. S. F. Edge, who is one of the competitors, has a "dark horse" for the contest for the Brassard Cup in the shape of a special De Dion racing tricycle fitted with a 6 h.p. motor. As Mr. F. F. Wellington is one of the competitors it is almost certain that he will mount his 7 h.p. machine recently illustrated in these columns, so that Monday's racing should prove of an exciting character.

The Gordon-Bennett Challenge Cup.

THE date for the Gordon-Bennett challenge cup race is rapidly approaching, and the contest is now the leading subject of conversation not only in automobile circles in France, but also in this country. As is fairly well known the date fixed for the race is Thursday, the 14th inst., and it may be useful to give once more the route, which is as follows:—Paris, Etampes, Pithiviers, Montargis, Nevers, Moulins, La Palisse, Roanne, Villefranche, and Lyons, a distance of about 560 kilometres, or 350 miles. It is probable that the start will take place from Versailles, and excellent roads will be encountered throughout the route, although the level nature of the course gives way to a hilly, if not mountainous, route after Roanne is passed. Our Paris correspondent this week sends us some interesting information regarding the race, which will be found in other pages of the present issue.

Some English Visitors.

WE hear that quite a number of the members of the Automobile Club are making arrangements to go over to France to witness the contest. Not a few are contemplating making the journey by motor-car, and judging from present indications several twin-Daimler cars will be taken across the Channel. A vehicle which is bound to attract attention in France is the 16-h.p. Napier car, which Messrs. Napier and Edge hope to take over about the 9th or 10th inst.

The Napier 16-h.p. Car.

WHILE referring to the Napier car we may mention that the success of this type of vehicle in the recent 1,000-mile Trial is likely to bring it into striking prominence at no distant date. Already a large number of 8-h.p. cars have been ordered, while of the 16-h.p. vehicles orders for seven or eight have also been secured. A feature of the 16-h.p. cars is that all the bearings are to be of the roller type, while as to the speed capabilities we understand that each vehicle will be guaranteed to be capable of travelling at a speed of a mile a minute. Among those who have 16-h.p. Napier cars on order are Mr. Roger Fuller and Mr. Mark Mayhew. The first one turned out, however, is for Mr. S. F. Edge's own use; it is being fitted with a special set of Dunlop pneumatic tires, 90 m.m. for the front wheels and 120 m.m. for the rear pair, this being, we understand, the largest size so far made. Mr. C. Jarrott is to be the fortunate possessor of the second vehicle of this type.

At the Anglo-French Association.

THERE was a gathering of the Anglo-French Association at the Café Monico, London, on Saturday, to hear Sir David Salomons on automobilism. The attendance included ladies as well as gentlemen, and their interest in the progress of automobilism was evidenced in the opportunities that were presented for conversation during the evening. Mr. Roger

Wallace Q.C., presided, and introduced Sir David Salomons in felicitous terms. Sir David had much to say of current interest as well as of permanent importance, and his reference to the ultimate reduction of the prices of vehicles of the voiturette class will be read with interest. As the industry becomes better organised in this country the possibility of lower prices will become nearer, but any great reduction will only follow an active demand. This is a point to be remembered by both the trade and the public, and makes the popularisation of the automobile in Society an essential factor in the development of the industry.

Sir David Salomons.

SEVERAL other excellent and suggestive ideas occurred in the paper, which we print on another page, and which is worthy the careful perusal of all interested in the subject; and Sir David's criticisms of various types of vehicles are most valuable. At the conclusion of the paper M. Bernard Mitson proposed a hearty vote of thanks to the reader of the paper. In doing this M. Mitson referred to the connection of Sir David Salomons with the Automobile Club of France, to which he had rendered great service. An article he had recently written in the review of the French Touring Club on public school life had created quite a stir in France, and if Sir David was not fully cognisant of the objects of the Anglo-French Association, he had, like M. Jourdain in talking prose, been helping them without knowing it. It had been said that the friendship of the two neighbouring nations would be firmly established when the French played cricket and the English rode on motor-cars. The latter

A BIG DESPATCH OF DAIMLER CAR.

was near its fulfilment, and the first was being furthered by Sir David Salomons' advocacy of his views on public school life.

Zola on the Motor-Car.

THE motion having been adopted with great cordiality, Mr. Wallace brought the speech-making to a pleasant conclusion by reminding the company of the importance attached to automobilism by no less a novelist than Zola, who had brought one of his novels to a happy conclusion by letting the lady turn bicyclist, and the gentleman convert some explosive material which was to have wrought vengeance, into a means for working an automobile. Automobilism was undoubtedly having a great effect on the French character, and he quite agreed with Sir Francis Jeune, who had lately pointed out the good work it was doing in improving life in the country.

Jules Verne's Views.

ZOLA is not the only novelist who believes in automobilism. Jules Verne, who foreshadowed the coming of the motor in his "L'Île à Hélice" and "La Maison à Vapeur," is also a firm believer in the regenerating mission of the motor. Only the other day he told a visitor to his house at Amiens that he believed automobilism to be the most precious of modern inventions. "Its destiny," he declared, "will be to combat the great danger of the future—the tendency of populations to desert the country for the great towns. The crowding of the great centres, the three-storied life, underground, surface, and overhead, decreasing birth-rates and increasing self-indulgence—

these are the spectres of the coming century. But the time is sure to come when every ordinary citizen will possess his motor-car, and let us hope there will come with it an emigration back to the fields."

Roads.

THE development of automobilism and the improvement of the roads are so intimately connected that no excuse need be given for the introduction to our columns of an extract from a paper read before the county surveyors of the country by one of themselves. From this, which is published on another page, it will be seen that Mr. G. J. Bell, the county surveyor of Cumberland, recognises the success which attended the recent 1,000-mile Trial and is of opinion that this form of road locomotion will shortly become general in this country. But, says Mr. Bell, if the people are to secure the best results from the new form of locomotion, county councils must have increased power to deal with highways, and also expend more than is now spent in devising roads of a better description. With his views automobilists will naturally have a large amount of sympathy and, individually, they can help their dissemination by placing them before county surveyors of their acquaintance for reading, if not for actual endorsement.

A Wail from the Park.

A GENTLEMAN calling himself "X." has been active of late in writing to the press against the motor-vehicles that are allowed in Hyde Park. He asks, "Is it the desire of the controllers of the park to destroy the pleasure of those of us who still delight in a fine pair of horses, for the convenience of the plutocratic manufacturers of machines which, however desirable they may be for the conveyance of Brummagem goods, are not fit for the society of self-respecting human beings." What a fine sentence, and how descriptive must "X." regard that phrase, "the plutocratic manufacturers of machines"? But is it not a little mixed? We did not know that motor-cars were any more intended for the "society" of human beings than are milk-pails, nose-bags, and even horses themselves. These things have their uses, and so have motor-cars, but none are intended for the society of man or woman. Such silly tirades are, however, becoming less in number if not in ferocity, and "X." should remember the case of Canute and the waves, and take the simile unto himself.

Motor-Cars in Poland.

IN view of the necessity for the improvement of our roads to take place simultaneously with the development of automobilism, there is a reference of interest in the report of the British Consul-General at Warsaw. Nearly all the efforts, he says, which were made to introduce the use of motor-cars have failed on account of the bad state of the Polish roads. The motor-car service between Piotrkoff and Kalish was discontinued after about a week's trial; that between Wloclawsk and Lipno was completely abandoned. It is more than probable that there will be no opening whatever for a long time to come for motor-car builders in that consular district; firstly, because running them is too expensive, and, secondly, on account of the deplorable state of the Polish roads.

Motor-Car Excursions.

MESSRS. DEACON AND SON, of Llandudno, are developing the idea of motor-car tours, and their programme will probably be of interest to those thinking of starting such services elsewhere. A Daimler car leaves every Monday, Wednesday, and Saturday at 11 a.m., for Colwyn Bay, returning through the Vale of Moelre, the fare being 2s. 6d. At 2.30 p.m. on the same day a car leaves for Penmaenmawr and Dwygyfelli Fairy Glen, the fare in that case being 4s. On Tuesdays and Fridays a longer trip at a fare of 7s. is being arranged

to Bettws-y-coed, and on Thursday, starting at 10 a.m., a run is made through Bettws-y-coed, Capel Curig by Lake Ogwen, through the Nantfrancon Pass to Bethesda, and returning *via* Aber, Llanfairfechan, Penmaenmawr, and Conway, arriving at Llandudno about 6.30. The fare for the latter trip is half a guinea. Messrs. Deacon and Son are providing short trips round Craigydun, and conducting the tours with an enterprise that should merit success. We also hear that Mr. J. J. Langley, of Park Square, Luton, is arranging similar trips in the locality of his town, two capital trips testing the capacity of his Motor Manufacturing Company's char-a-banc, and giving the passengers a good view of the surrounding country, being to Old Warden (*via* Bedford) and Hitchin respectively.

Motor-Cycles and How to Manage them.

THIS is the title of a useful little handbook which has just been issued by Messrs. Iliffe, Sons, and Sturmev, Limited. It is from the pen of Mr. A. J. Wilson, whose acquaintance with motor-cycles is of the most complete kind. After a chapter on motor cycles generally, there follows one on how to ride and drive, one on the motor, and another on the care of the machine. Defects and their remedy are next dealt with, while a useful chapter is devoted to motor-cycle law. The little work is one which should prove of assistance to all who are contemplating entering the rapidly-increasing army of motor-cyclists.

A Tour on a Steam-Car.

MR. GEORGE ISHAM SCOTT, a member of the Automobile Club of America, recently made a tour with his Locomobile steam-car of more than six hundred miles. Leaving New York Monday, April 4th, he reached Philadelphia the same evening, finding the roads fair and the machine running to perfection. From Philadelphia to Havre de Grace, on the Susquehanna, the roads were very rough and difficult, but the trip was made without mishap. The evening of the third day out of New York found him in Washington, where he remained three days. The cylinder head and steam chest needed repacking, and this was done while in Washington. From Washington to Baltimore and to Havre de Grace the roads were deep with mud, and extreme care was necessary to bring the wheels out of the chuck holes. In turning a corner in Baltimore a wheel came too close to the curb, and a visit to a repair shop was necessary to have the eight damaged spokes replaced. From Philadelphia back to New York everything ran well, and over a twelve-mile stretch alongside the railroad a little brush with the train was one of the pleasant diversions. The train came in a minute and a-half behind the automobile. Mr. Scott and his brother, who accompanied him, expressed themselves, states the New York *Automobile*, as having thoroughly enjoyed the ten days' tour.

Motor-Cars and Tram-Cars.

WHERE monopolies exist high fares are generally the rule. At this point the motor-car can often be utilised in the public interest, and the inauguration of the Lincoln Motor 'Bus service along certain streets of the city, which we announced last week affords an instance. There was some talk of the company running their motor-buses on the High-street route—from the Cornhill to Bracebridge and back, and the possibility of opposition seems to have had its effect on the Tramways Company, for they have reduced their fares from twopence to a penny the entire distance, a concession for which the public had vainly asked for years. The reduction in the fare will be none the less appreciated because it comes rather late in the company's existence.

In Madagascar.

THE technical secretary to the Automobile Club of France, the Count de La Valette, is about to leave Paris shortly for Madagascar in company with General Gallieni, and automobilists will be interested to learn that he is taking with him no less than six specially constructed self-propelled vehicles. These cars are fitted with 12-h.p. motors, and are intended for

public service work in the island. Certainly the experiment of M. de La Valette is a bold one, for with the roads none too good and the grades exceedingly heavy the work will not be easy to perform. Should the enterprise prove successful it will appeal strongly to those colonial governors who are desirous of further opening up the provinces under their control, and the experiment will undoubtedly be followed by them with considerable interest.

Aluminium.

At the annual meeting of the British Aluminium Company, held the other day, Mr. Roger Wallace, Q.C., made reference to the effect of the automobile industry in assisting the development of the company introducing aluminium into France. "The increase in their business," he said, "was due to the motor industry; for in automobiles aluminium is largely used. We are only beginning that industry in this country, and I was pleased to see that in the 1,000-miles tour, which took place recently, most of the machines used aluminium. These are only sample machines; but we believe from that industry we have a great deal to expect."

The Finchley Carnival.

ON Thursday, the 24th ult., Finchley kept the Queen's Birthday by afternoon and evening parades in aid of the Widows' and Orphans' Fund. Automobilists duly took their part, a few running in the afternoon and several in the evening processions. The costumes were good and the decorations

Photo by]

Edgar Scamell, Crutch Hill.

on the ears looked especially well when illuminated by the many Japanese lanterns which most carried. Owing to the morning rain side-slip was rather prevalent amongst the cyclists, two of whom fell within five feet of the front of a motor-car, which, happily, was able to pull up in time. All passed off well, and no doubt the Fund will receive a handsome addition as the result of this worthy effort. Our illustration shows Mr. C. W. Brown on his Benz car as Dick Turpin, and Mrs. Brown as Mother Shipton. The other car is that of Mr. Johnson, who paraded as Paddy, while Mrs. Johnson represented Ireland.

Opposition to Motor-Cars.

A MEETING of 'bus proprietors, chiefly those in the Torry district of Aberdeen, has been held in Mr. Scott's office, for the purpose of protesting against the proposed motor-car service to Torry and the beach. Councillor Gray presided. He said that the object of the meeting was to make it clear to the people of Torry that they were not going to throw up the sponge in view of the proposed introduction of motor-cars. He thought it a great hardship that when a few men put their savings into a few machines and horses they should be swooped down upon by men who had some capital which they were evidently

anxious to get rid of. He was sure that in London alone at least a quarter of a million of money had been sunk for such a project, but no company had yet been able to pay one farthing of a dividend. Perhaps it would only be friendly to express the wish that their friends in Aberdeen might be successful. Had the project, however, originated with the Torry people, it would have been excusable, but it was not the right thing for others to step in for the purpose of taking away the living from men who had a hard struggle to get ends to meet. The result of the meeting was that a committee was appointed to look after the interests of the drivers, and do anything necessary to safeguard these interests.

The Legal Status of Motor-Vehicles in America.

MR. FRED D. STANLEY, a Boston lawyer, has written a pamphlet entitled "Motor Vehicles in the Public Streets and Highways; Their Legal Rights and Liabilities," in which he reviews numerous American statutes bearing on the subject, and quotes opinions delivered in over a score of cases involving the use of streets and highways in unusual ways. The author defines highways and streets, showing that the former include the latter, and pointing out that "a municipality has no authority over the streets within its territorial limits, except such powers as are delegated to it by the Legislature, and in no case can it exercise dominion beyond those powers." The streets and highways being for public use, except as restricted in dedication or by statute, no particular mode or modes of locomotion can be favoured thereon by the municipality. This, however, does not debar the municipality from enacting such regulations of traffic as are necessary for the general advantage; but it debars total prohibition of anything not demonstrably a nuisance. "The drivers of horses have no more rights in streets or carriage ways than those using other common modes of conveyance, and the mere frightening of horses is neither actionable as a tort nor complainable as a nuisance, nor an obstruction which city officers or public boards are accountable for." "Some horses are frightened at a piece of paper, others are not. * * * Some horses are frightened at bands of music, others are not, but it is a recognised principle of law in this country that no action can be sustained against a municipality that permits bands to march through its streets, by reason of which some horse may become frightened and occasion damage." This fact should be more widely realised in this country.

An Accident at Luton.

WHEN motorists are going along roads to which they are unaccustomed exceptional care should be taken. It was probably owing to the driver being unaware of the precipitous descent of the London Road hill at Luton that a recent accident occurred which will probably upset the nerves of those who only look at the dark side and take little notice of the thousands of miles that are now covered with safety by motor-vehicles every week. If the vehicle had been drawn by horses and the results more serious they would have said nothing. It appears that Mr. W. A. Sewell was driving his motor-car, his son, Mr. F. Sewell, and a lady and gentleman friend being passengers. They had had a capital run to Luton, but in coming down the London Road hill the car got a great impetus, and while an effort was being made to negotiate a bend in the road the driver appears to have missed control of the steering apparatus and the vehicle capsized, throwing the occupants into the road.

Help at Hand.

THEN came, to the onlookers, the sensational part of the proceeding, for some of the woodwork of the car caught on fire. Water was stupidly thrown on to the flames, and only when sufficient earth had been piled on were they put out. Fortunately Mr. J. J. Langley, who has a motor and cycle works in Park Square, Luton, was quickly on the spot, and with assistance he was able to get the car up and run it to his works

for repairs. It is clear that the affair was owing to no breakdown of the working parts, and altogether there was nothing in the unfortunate mishap to shake local confidence in motor-cars.

Touring Europe.

IN the early days of the Queen's reign the tour of Europe was regarded as an indispensable part of the education of the man who could afford the expenses of the journey. Latterly, however, it has fallen from its old popularity, and extended roving has taken its place combined with a closer study of our own country and the colonies. Will the idea of European tours on motor-cars do anything to resuscitate the favour with which the "grand tour" was once regarded, seeing the extended adoption of the automobile on the Continent and the facilities it offers for seeing the landscape while covering great distances in short spaces of time?

Baron de Crawhez's Travels.

WE are led to this reflection by a series of photographs published on another page. These views were taken during the recent tour of the Baron P. de Crawhez (a leading member of the automobile world of Belgium) through France and Italy, and concluding as far away as Tunis and Algeria. The Baron's love of travel has just led him to another automobile trip, this time through Switzerland, where his experiences ought to be particularly interesting. Such tours as these, occupying many weeks, going over roads of infinite diversity and in climates of equal variableness, afford strong testimony not only to the reliability of the motor-car, but also to the cosmopolitan character it is likely soon to attain.

Views in Rome and Algeria.

THE first photograph is a snapshot on the Grenoble road, in France, where automobiles are familiar sights indeed. That to the right is a view of La Grande Chartreuse. The third and fourth photographs present views of the modern automobile amid ancient surroundings—St. Peter's at Rome and the Coliseum. Evidently the presence of the motor-car at the latter place attracted the curiosity of the inhabitants, some of whom must have thought it in very incongruous association with the famous ruins to which gladiatorial contests and chariot races have been far more familiar than "merely modern mechanical contrivances." The last pair of photographs were taken in northern Africa, and apparently the natives quickly grew accustomed to the motor-vehicle, probably regarding it as something associated with the march of civilisation. What would they think could they read the comments of some of our rural councillors on the subject?

Dust.

SPECTATORS of the recent 1,000-miles Trial were much impressed with the dusty appearance of the cars and their passengers, and the impression has become current that such a dusty aspect is inseparable from automobilism. Those with that view should remember that when they saw the cars they had been some days upon the road, and that the vehicles left each day in procession. Those in the rear of a long row of horse-drawn vehicles would appear equally well covered with dust, and the roads leading to Epsom Downs on Wednesday revealed the work of horses' hoofs in raising the dust to an extent to which no motor-car has ever been guilty. The other day we drove to Hampton Court in a carriage and pair, and can testify to the dust that was raised being quite as irritating and annoying as that associated with a motor ride along the same road. A few minutes' reflection should be sufficient to convince anyone that a motor-vehicle having no horse in front cannot possibly raise the dust in such quantities as an ordinary carriage or cart.

A PROJECT is on foot at Nice to establish an automobilodrome. The proposed track would be ten kilometres long.

A FIVE-MILE MOTOR RACING TRACK.

THIS is Derby week, and old frequenters of the famous Epsom road have been deploring the altered character of the crowds that formerly attended the great race. Without entering into the *pros* and *cons* of their contentions it would be interesting to inquire whether motor-car races are ever likely to attain the importance of the Derby in the popular mind. Epsom, Ascot, and the other great race meetings have each their devotees, and we believe the formation of a track equally carefully prepared as is the racecourse would lead to the raising of automobilism to a position of first-rate importance. We in Great Britain have little idea of the possibilities that lie in motor-car contests. French automobilists have raced until the pace has frightened the authorities, who have interfered so as to seriously curtail the normal privileges to which we contend they are legitimately entitled.

In this country, on the other hand, the limits of speed on country roads have not given manufacturers the opportunity for suggested improvements which rather higher speeds would have provided, and *chauffeurs* who have watched with pleasure the doings in some of the less conspicuous French races have sighed for less restrictions and occasional lapses into rapid flight along unfrequented roads. They do not want to rush round corners at a break-neck pace; they have no desire to knock their heads against brick walls; but they would like an opportunity of enjoying the exhilarating experience of rushing along the countryside without fear of the policeman's power of imagination being used to mulct them in heavy fines and damages. This feeling has probably been increased by the success of the recent great trial and those who put on speed at Welbeck and through Clumber Park felt an incitement that should be ministered to in some way or other.

Hence we regard the provision of an automobile track as a matter of great importance to automobilism, and also as meeting the need for the organisation of sports and pastimes on a thoroughly representative scale. Firstly, such an institution would provide a centre for automobilism as a sport, and destroy the necessity for any suggestion for road racing—a form of motorism that is never likely to be acceptable to the great majority of the British public. The desire for going ahead on a motor-car can no more be wholly suppressed than the anxiety of the race-horse to go to the front; hence the need for some place where trials of speed could be carried out without hindrance from the police and without risk to the public.

In view of the rapid growth of the automobile industry, and the favour with which the sport is being regarded, any scheme of the kind we have indicated should be conceived on broad lines, and carried out with a liberal policy. It would not be wise to

have the track of small diameter so that the feeling of fishes in a globe should be borne in upon the minds of those who used it. There should be varying gradients as well as straight runs, and after discussing the matter with several gentlemen who regard the proposal as quite feasible, we have come to the conclusion that a track five miles round would present an opportunity that all automobilists would enjoy. With a width of fifty or sixty feet and with well-marked lines so that the motor-vehicles should not cross each other's paths there should be every chance of getting up to good speeds without the dangers and accidents that have proved inimical to the sport on the Continent. Such a track with a good macadam road never traversed by horses would give manufacturers as well as owners a means of adequately testing the speed of their vehicles and so establishing a standard criterion which would be useful to buyers and serviceable to makers.

As to the locality, such a venture would have to be established within easy access of London, say, at a distance of thirty or forty miles. There are plenty of estates within such a radius unprofitable as farm land, only poorly productive as market

gardens, and not yet ripe for building where such a track could be laid without any great road-making difficulties being encountered. Some landowners might regard the proposal as one worth encouragement, and doubtless a good area could be obtained on reasonable terms if the proposal were made by a band of enthusiastic motorists.

While providing the opportunity for developing automobilism as a sport, such a track would also serve as the centre for other sports of a popular character, for within the space actually required for the

motor-cars, grounds for tennis, cricket, golf, and other amusements could be laid out, and a careful planning should ensure arrangements for social festivities, with features that are now impossible. The matter is certainly worth discussion, and we shall be glad to open our columns to correspondence on the subject, feeling certain that something of the kind would go far in helping the new locomotion as well as showing its possibilities as a sport. When the automobile world has just shown how successfully it can organise a great tour throughout the length of England seems a fitting opportunity for the introduction of such an idea which seems to give the opportunity for speed that automobilists require and also to introduce motoring to the votaries of other sports as one deserving their consideration and likely to give healthy pleasure and keen enjoyment.

THE *Daily Express* on Wednesday had a sketch of "Going to the Derby twenty years hence"—showing the roads lined with automobiles of various types conveying spectators to the famous Epsom course.

THE MOTOR MANUFACTURING CO.'S 6 H.P. IVEAGH PHAETON.—No. 9 IN THE 1,000-MILE TRIAL.

MOTOR-CARS ON THE CONTINENT.

French Ministers who Motor.

M. WALDECK ROUSSEAU himself, President of the Council, is one of the latest notabilities to join the ranks of automobilists, and during a recent visit to Havre he might have been seen frequently driving a car. But he is not the only French Minister to whom the pleasures of motoring appeal, for already we have M. Pierre Baudin and M. Jean Dupuy, both enthusiastic followers of the new sport. Now if M. Lépine, the Préfet of Police, could be won over to the cause of automobilism, what a victory that would be, and how easier in mind would become the Parisian *chauffeur*! And why not?—for all things are possible, and M. Lépine himself is as susceptible to the pleasures of smooth and easy travelling as the rest of mankind.

The Clement Voiturette.

MESSRS. CLEMENT, of Levallois, Paris, are now manufacturing a two-seated voiturette of the type illustrated herewith. The motor is of the De Dion 2½-h.p. air-cooled type, geared direct to the rear axle by a two-speed gear. The engine is placed well below the body, and the sides of the latter are of perforated material, to permit free access of air to the

cylinder. Steering is controlled by a sloping hand-wheel in proximity to which all the control levers are located. The carriage, which is capable of attaining a maximum speed of 30 kilometres an hour, weighs only 300 lb., or just below 3 cwt.

Chéri's Sale.

ONE of the most interesting features among recent automobile events in Paris has been the auction held some short time ago at Chéri's establishment at Neuilly, not only by reason of its novelty, but also on account of the far-reaching effect it may ultimately have upon the industry. A year ago a somewhat similar sale was held by M. Charron with results so little beneficial to himself that he has not since repeated the experiment, and apparently has no intention of doing so. But the conditions prevailing at the *garage* of M. Charron and the Haras de Saint-James are so totally different that what proved a failure at the former may well score many successes at the latter. Looking at the sale as a novelty the experiment was certainly a peculiar one in a spot so inseparably associated with blood stock as Chéri's. Those sportsmen who habitually attend the sales held at the famous establishment would have hardly recognised the lawn and the horse boxes, so absolutely destitute were they of the noble steed. And in place of the yearlings there were numbers of smart cars being put through their paces before a crowd of the best known automobilists of the day. The vehicles put up for sale were the property of M. Edmond Blanc, Prince Obidine, Prince Pierre d'Arenberg, Comte Gérard de Ganay, Baron de

Dietrich, Marquis de Balleroy, Vicomte Foy, Vicomte de Perigny, Comte de Beaumont, M. Michel Ephrussi, and several other leaders of automobilism in the fashionable world. The majority of these owners put a reserve price upon the cars; indeed, the idea of ascertaining the marketable value of their vehicles more than the desire to actually sell them seems to have prompted these society *chauffeurs* to include their mounts in the sale catalogue. As a consequence, but few vehicles changed hands, although the aggregate of the bids made exceeded £12,000. M. Halbroun, who was conducting the sale, was, however, more than satisfied with the result, not only because more cars were disposed of than he anticipated, but also by reason of the interest manifested in the experiment. Many leading automobilists expressed their hearty approval of the idea, and intimated their intention of sending some of their cars to M. Halbroun for disposal; indeed, it is extremely probable that another and larger sale will be held at an early date. In the event of regular auctions being established the immediate effect will be the diminution of the excessive prices now demanded by the leading agents and a corresponding spread of the industry. It is the middleman who takes the heavy profit on automobiles, for in general the constructor's price is not excessive, and it is only when a car gets into the hands of the intermediary that its value goes up to fancy figures. Regular sales, too, will afford to wealthy automobilists an outlet for their cars of an older type to that of the prevailing fashion, and these vehicles will be eagerly sought for by those motor-men unblest with a purse sufficiently long to enable them to possess a car of the latest pattern. I am of opinion that the institution of such auctions will have a distinctly beneficial effect upon the industry, and it is to be hoped that a system of sales at regular intervals can be organised.

Cabourg's Troubles.

It will doubtless be remembered that towards the close of last summer the whole automobile world in France was horrified to learn of an apparatus designed by the owner of a property in the vicinity of Cabourg, for the purpose of preventing the passage of cars along the road adjoining his grounds. This contrivance consisted of a tree, cut at the base, and held in place by means of ropes and pulleys. Upon the approach of an automobile the tree was promptly dropped across the route, effectually barring the way, and the anti-automobilist chuckled with delight. This innocent amusement having been put a stop to, the gentleman has broken out in a new direction. It appears that, having a strong personal objection to the deputy-mayor of Cabourg, he intimated to the inhabitants of that charming little town that should the official be re-elected for the current year he would transform his house into a sanatorium for contagious diseases. As a result of the recent municipal elections the deputy-mayor has, however, been re-elected, and now the threatened sanatorium has duly made its appearance, presumably with a proper complement of sufferers from infectious maladies. What a charming citizen the man is, and in what a bewildering state of perplexity must be the inhabitants of Cabourg, the situation not being simplified by the steadfast refusal of the deputy-mayor to resign. Developments are awaited with interest.

The Mechanic.

A LEGAL case that has excited considerable interest in automobile circles was decided in the Paris courts last week, and the judgment given should have a salutary effect upon those mechanics—and unfortunately there are only too many of them—who consider themselves to be superior beings to the ordinary mortal in general and to their employer in particular. In the case under notice M. Michel Ephrussi, a well-known French sportsman, had engaged some time ago a *chauffeur-mécanicien* named Martinet to look after his cars at Melun, where he has a large estate. According to his master, Martinet frequently absented himself without leave, and upon returning from one of these pilgrimages M. Ephrussi gave him eight days' notice to leave, and the amount of salary due to him to that date. This

proved not to be to the liking of Martinet, for he commenced an action against his former employer, claiming a month's salary, viz., 250 francs, and 100 francs compensation, based upon the argument that he was an employee and not a mere domestic servant. The court did not, however, uphold this view of the case, but ruled that Martinet was a servant and as such entitled to but a week's notice. There exists in France, just as there exists in England and probably every other country, a class of mechanics which may well be styled the "swollen-headed brigade." The members of this community are indeed a trial and a tribulation to the automobilist, for when they do condescend to engage with a master they give him no peace of mind. They don't clean the car—oh no! that is a stableman's work; they don't carry out repairs—that is a workman's occupation; they object to sit upon a back seat, or wear a uniform, and if they occasionally condescend to drive it is merely to show their long-suffering master how a car should be driven. If anything goes wrong with their charge—and I have known things happen even with the best of cars—these men regard their masters with withering scorn and mumble remarks about "no gear will stand changing speeds like that," or some similar criticism. Of course there are mechanics who do not belong to this class, but in general they are young men ignorant of the usages of the profession. Why, not so long ago, I heard of a mechanic who, having been so kind as to enter the service of a lady automobilist, so far forgot himself as to permit her to actually drive the car while he sat on the back seat, until a fellow engineer pointed out the enormity of his fault, when he promptly resigned his engagement. What would the profession come to if such proceedings were allowed? Oh, no, our young friend might have been asked to start the motor next, as if there were not ordinary men for that class of work. On the other hand, there are numbers of skilled mechanics who take a pride and pleasure in their masters' cars, and to whom no work is too hard or too difficult, and it is to these men that automobilism owes a debt of gratitude, for, thanks to their efforts, their cars run with regularity and with that absence of mishap which does so much to convince the public of the reliability of the new form of locomotion.

The South-Western Clubs.

THE authorities having officially sanctioned the Bordeaux-Périgueux-Bordeaux race, the first stage of this event will be contested to-morrow over a course of 116 kilomètres. Starting from Bordeaux the racers will pass by way of Libourne, Saint-Médard, Monpont, and Mussidan to Périgueux, where, upon conclusion of the race, an automobile exhibition and congress will be held. On Monday the big cars of 8 h.p. and upwards will return to Bordeaux by a circuitous route of 202 kilomètres, through Ribérac, La Roche-Beaucourt, Angoulême, Barbezieux, Montlieu, and Saint-André, while the journey to the same place for the smaller vehicles will be one of 144 kilomètres only. In connection with the race over the longer route there will be decided the championship of the south-west of France, the title going to that member of a local club whose car makes the best time over the course. More than thirty entries have been received for the various categories, among them being the names of Levegh, Bostwick, Joyeux, Legendre, Briol, and Rondier. The organisers of the race are the Automobile Clubs of Bordeaux and Dordogne.

An Original Idea.

ONE of the most recent novelties is that introduced by M. Guérin of Bordeaux, and consists of a compact little arrangement by means of which the occupant of a trailing car can render muscular assistance to his companion in ascending hills without resort to the somewhat *infra-dig.* method of pushing. A very simple arrangement of levers and chain wheels, which remains absolutely stationary except when operated upon by the occupant of the car, should certainly have a market, for in a country at all hilly the use of the trailer is but little known by reason of the difficulty in ascending severe grades.

The addition of a trailer to a motor-cycle makes little difference on level, or fairly level ground, but when a grade has to be mounted it is quite another story, and the passenger cannot in common decency sit still while the motor-man pedals the two for dear life. So he gets out and pushes, and doesn't like it, not a little bit. But to remain comfortably seated and pedal for a while would not have such a disturbing influence, so possibly M. Guérin's idea may be made much of.

Racing in France.

AUTOMOBILISTS in France are happy again, for, as I anticipated in these columns, the veto placed upon automobile road-racing by the authorities has proved of short duration, and all fixtures from this date onwards will take place just as originally intended. It was on the 26th ultimo that the Governmental decision was made known by the Minister of the Interior to the Comte de Chasseloup-Laubat, M.M. Jeantaud and Ravenez, the delegates of the Automobile Club of France, who had gone to consult him as to the prospects of holding the race for the Gordon-Bennett Cup and the "Course de l'Eventail," and very quickly the whole motor world of Paris learned the good news. So after all we are to have the two above-mentioned races, and also Paris-Brest-Paris, Bordeaux-Périgueux-Bordeaux, Draguignan-Aix, and although not actually quoted, presumably Paris-Ostend. All this fuss and excitement has been truly typical of the character of the good people on this side of the Channel. The sudden change from laudation to denunciation of road-races, all on account of the miserable accident at the Croix-des-Noailles, which was occasioned quite as much by the fault of the spectators as that of the racers, was of much too violent a nature to last any length of time, and now after a month of senseless persecution and rigorous restrictions we are back in much the same position as before. The agitation has done good, I do not deny it, but the same result might have been attained without such a display of feeling as we have recently witnessed. The Sports Committee of the "A.C.F." are now hard at work in organising the Gordon-Bennett Cup race, which is set down for decision on Thursday, June 14th. What a race it should be! The cars of the three cup defenders are now practically ready, while Mr. Winton is in Paris with his racer. This latter vehicle has but little the appearance of a *voiture de course*, and on the day of the race will look puny beside the French leviathans. Its single-cylinder motor only develops 10 h.p., while the lightness of construction and the absence of the wheel steering so universally adopted on French racers give the car the appearance of a pleasure vehicle rather than that of a high-speed racer. Perhaps its very simplicity will carry it home, but my own opinion is that the Frenchmen need have no serious apprehension from this or any other foreign competitor.

Public Services in Brussels.

APPLICATION has been made to the Permanent Deputation of Brabant to establish a public service motor-vehicle between the Luxembourg and Midi Railway stations in Brussels. It is also proposed to start a similar service between La Porte Louise and the Rue de l'Abbaye in the Belgian capital and the suburbs of St. Gilles and Ixelles.

THE Boston Automobile Company has been registered at Bar Harbour, Me., U.S.A., with a capital of £20,000.

FOUR motor-cars figured prominently in the procession organised at Lowestoft to celebrate the relief of Mafeking.

"M AND B," who inquire for the makers of a magneto-electrical sparking device, are referred to the Motor-Carriage Supply Company, Ltd., of Balderton Street, London, W.

THE New Jersey Electric Vehicle Transportation Company has arranged to instal automobile stations during the coming season at a number of points on the Jersey coast. At each of these stations Columbia automobiles, both electric and petrol, of various designs, will be for sale, and a speciality will be made by charging and caring for motor-cars owned by private parties.

TOURING NOTES.

BY A WORLDLING.

ENGLISH automobilists who are going to Paris for the Exhibition, and who purpose taking their cars with them, must bear in mind that they can be fined and even imprisoned if they cannot produce a *permis de conduire* on the demand of a *sergent de ville*. The war against automobiles in France has lost much of its severity, but I pity the English offender who has to appear before M. Mule or, indeed, any of M. Lépine's lieutenants of the magistrature. The risk of travelling on one's car without a *permis* is very great just at present, but it is by no means easy to devise a scheme that will overcome the difficulty of an inconvenient day being fixed for examination. The only thing to do is to ask politely if it would be possible to hold the examination on the day and at the place you land in France at the same time as you send in your official request for a driving licence. This request must be addressed to the *préfet* of the department (Pas de Calais, if you go by Calais or Boulogne, Seine Inférieure by Dieppe), and must give your full name, occupation, and address—if you are a member of the A.C.G.B.I., it would be well to state it—and a description of your car. If the car is of French make it will be only necessary to give the name of the manufacturer, the "type," and the number of the "type" series, particulars which can easily be obtained from the dealer who sold the car, if they are not actually recorded on a *plaque*. If, however, it is an English car, not registered as a "type" in France, you would do well to give the fullest particulars of its construction, not omitting a careful description of the brakes. Enclose in your letter, which must be written on *papier timbré*, two photographs of yourself, not on cards. In a few days you will receive a letter telling you to present yourself for examination at a certain time and at a certain place. The driving examination is not difficult, but the judges may make a little trouble about your car if it is not of a recognised type, especially if it is a steam one. The *permis* which you will receive will be only for the type of car in the driving of which you have been examined, but it is possible to get a certificate for any and every type of car; this is, of course, a much more tedious affair.

The French speed regulations are not well-known in England. They are very reasonable, as may be seen from the following translation of the 14th Article of the Decree of March, 1899: "The driver of an automobile must have its speed under instant control. He must reduce it, or even bring his car to a standstill, whenever it might cause an accident, disorder, or a block in the traffic. In narrow passages and when the traffic is congested the car must not be driven at a greater pace than that of a man walking. Under no circumstances may the pace exceed 30 kilomètres an hour in the open country and 20 kilomètres an hour in *agglomérations*." *Agglomérations* means anything from

a small hamlet up, but it may be made to mean, as after the Croix de Noailles accident, a small shop and an ambulance wagon. But, at any rate, 18 miles an hour in the country is sensible.

Baron de Crawhez, the most popular *chauffeur* in Belgium, and a keen tourist, does not think much of Italy as a country to travel through on a motor-car. He made a trip in the early part of the year from Rome to Naples on a car which he had bought from Charron, and to which he had given the ill-omened name "Devastation." Although his experiences were not quite so bad as Senor Juan Ricano's in Castille, they were sufficiently unpleasant. At Teresina a howling and malodorous mob broke the lock of the *remise* in which he had put his car, and stole several things from it. "The same thing, only more so," at Gaeto, where the crowd nearly tore him to pieces. This is almost as bad as at Macclesfield, where the aborigines are the most savage people in the world. Ask Mr. Herbert Ashby, who was *en panne* there for a few minutes during the "Thousand Miles."

I strongly advise anyone going through Ripley not to pass by the Talbot Hotel without going in. First of all, the cheer is of the best, and then mine host keeps petrol as well as wine.

The other day a party of us were down there on a Mors, when we suddenly discovered that we had lost all our petrol through a small leakage; and what did this good man do but send his own traps six miles out and six miles back to get some for us, and then refuse to take a penny for work done? It is good to chronicle such acts of kindness to the *chauffeur*.

It would be impossible to find a more delightful trip than one from London to Monte Carlo. One passes

over excellent roads, through some of the finest scenery in Europe, and the hotel accommodation is of the best from start to finish. As many of the readers of the *Motor-Car Journal* are probably going to take their cars over to France for tours in the summer, I should advise them to follow the route and "tips" I give here and they will be certain of a most delightful run.

FIRST DAY.—From London to Dieppe via Newhaven. The road is so well known that it is hardly worth while describing it here. Get to the boat as early as possible, as there is sometimes difficulty in the shipping of a car.

SECOND DAY.—From Dieppe to Paris. You will arrive in Dieppe early in the morning. You will have to get your car through the *douane*, pay a deposit and have it *plombé*. Then get some one to show you the way to Meyer's *garage* by the Casino. Let him fill up with petrol and oil while you go down to the Grand Hôtel, where Monsieur Découvert, himself an enthusiastic *chauffeur*, will give you as good a breakfast as you can want. Then off to Rouen, where you would do well to lunch at the Hôtel de France; it is not so well known as the Angleterre, but the experience of many years has taught me that it is the best hotel and the cheapest in the town. If you want petrol or any thing done to your car go to Bernard, 9, Place de l'Hôtel de

THE ANTOINE VOITURETTE. (For description, see opposite page.)

Ville. Then on to Paris. Stay at the Continental, as there is a covered yard at the back where they will let your car stay for the night. The porter will get you petrol—you had better insist on Stelline in *bidons de cinq litres*. If you want any mechanical help telephone 503-50 and ask Messrs. Guyenet and Balvay to send you down a man who understands the type of car you are driving.

THIRD DAY.—From Paris to Auxerre. As far as Melun the road is very bad, big cobbles the whole way. Lunch at Sens. Get petrol from Saussier, an excellent *mécanicien*, 23 Cours Tarbé, and then go on to Auxerre, where you can get Benzomoteur from Charlot. I cannot remember the name of the hotel I stop at there, but it is in the main street; any one will tell you where the automobilists usually go. There is a little Café Concert in the same street where one can spend a fairly amusing evening.

FOURTH DAY.—From Auxerre to Dijon. A magnificent run over one of the most perfect roads in Europe; lunch at Avallon; petrol from Corniau, wholesale grocer. Go to the Hôtel de la Cloche at Dijon: prices reasonable, large coach-house behind. If you want anything for your car you had better send to Cottureau et Cie., Usines des Lentillères. Their voiturette holds the 100-kilometre world's record, and they can be relied on to do their work well.

FIFTH DAY.—From Dijon to Mâcon. Lunch at Chalon-sur-Saône; petrol from Preuil, 8 Place St. Pierre. At Mâcon, stop at the Hôtel des Champs Elysées, a very good hotel with an excellent garage for automobiles.

SIXTH DAY.—From Mâcon to Geneva. This is a hard day's work, as the country becomes very hilly; the roads are, however, excellent. Lunch at Nantua—Hôtel de France, cheap and good. Petrol may be obtained here. Then on through the most wonderful scenery by Bellegarde to Chancy, the frontier town. Here again you must pay a deposit of 100 francs or so, and have your car *plombé*. At Geneva stay at the Métropole and overhaul your car well, as there is trying work for it ahead. If you want help go to Panchaud, at the corner of the Jardin des Anglais, nearly opposite the hotel. He will be able to give you petrol and any assistance you may require.

SEVENTH DAY.—I should advise a rest for man and machine. Go and call on the Automobile Club de Suisse in the Parc des Eaux Vives; you will probably find some member who would be glad to go for a run down the lake towards Lausanne or even right round.

EIGHTH DAY.—From Geneva to Grenoble. Frontier at Chêne, where your 100 francs will be returned to you and your Swiss *plomb* taken off. Then by Annecy to Aix-les-Bains, where lunch at the Brasserie Russe, in the Avenue de la Gare, and take petrol from Domenge, in the Avenue du Petit-Port. On *via* Chambéry to Grenoble. The best hotel in Grenoble is the Monnet, in the Place Grenette, the centre of the town. Petrol and repairs from Ducroiset, the famous automobile manufacturer, 15 Rue Voltaire.

NINTH DAY.—From Grenoble to Digne. A long climb *via* Monestier de Clermont and Clelles to the Col de la Croix Haute, and then down into Sisteron by St. Julien and Veynes. Take petrol at the last named village, at a small *épicerie*, painted blue with green shutters, in the middle of the only street, but do not be induced by the most terrible pangs of hunger to eat anything at the hotel, as it is the worst in France. Push on to Sisteron, where you will find the Nègre very comfortable. By-the-way, it is a favourite inn of the poet Mistral. At Digne stay at the Boyer-Mistre, a good hotel, but with a very indifferent cellar.

TENTH AND LAST DAY.—From Digne to Monte Carlo. Start early and go straight away to Castellane, where you can have breakfast of eggs and asparagus at the little Hôtel de Commerce. I remember staying there once with a friend and a servant. Our bill for the three, supper with wine, lodging and breakfast, was 12 francs 50 cents. From Castellane there is a long pull up, and then a wonderful run down through Grasse into Nice. Petrol, repairs, etc., at the Autogarage de Nice, at the corner of the Boulevard Gambetta and the Promenade des Anglais. From Nice to Monte Carlo is the most perfect run in the world; it is worth going the hundred of miles to see. At Monte Carlo stay at the Cesari Palace Hotel, if it is open; if not, at the Hôtel de Paris, which is never closed. Roustan, of the Avenue de la Costa, will help you with anything you may want for your car.

THE ANTOINE VOITURETTE.

THE illustration given on the opposite page shows the light voiturette exhibited at the recent cycle and motor-car show in Brussels by Messrs. V. Antoine Fils and Co., of 43, Quai St. Leonard, Liège. The frame is of tubular construction, the body being comfortably suspended by plate and C-springs. The car is propelled by a single-cylinder vertical motor, known as the "Kelecom," and rated at 4-e.h.p. It is fitted with electric ignition and water jacket, the latter extending around the combustion chamber as well as the cylinder. The engine is located in the fore part of the frame, under the bonnet, and is started by means of a detachable handle. Two speeds are provided, the power being transmitted direct to the rear axle. Steering is controlled by an inclined wheel on the standard on which all the control levers are mounted. The wheels are of the cycle type, fitted with pneumatic tires. The car, which has a neat appearance, will, it is claimed, mount any ordinary hill.

MR. W. J. PEALL, THE WELL-KNOWN BILLIARD PLAYER, ON HIS DAIMLER CAR.

MR. C. CLIFFORD POTIER, of "St. Moritz," Cambourne Road, Sutton, Surrey, has sent us a copy of a useful little illustrated list of motor-cycle accessories he has just issued.

MR. F. R. HATCHER, of the Saracen's Head Hotel, Dunstable, keeps Capel Carless and Leonard's petrol and also Pratt's motor-car spirit, a fact of interest to all automobilists using that important road.

MR. JULIUS HARVEY has, we are glad to find, recovered from his long illness, and is now to be seen as usual at his office, 11, Queen Victoria Street, E.C. His firm, Messrs. Julius Harvey and Co., have just secured an important order for abroad for steam motor-vehicles for both passenger and goods service.

THE Star Motor Company, of Wolverhampton, have sent us a long letter in reference to the performance of their car in the ascent of Bunny Hill, on the way from Nottingham to London, on the last day of the 1,000-mile Trial as given in a contemporary last week. The Star car was classified under the heading "stuck," and to this in the letter referred to the Star Company take exception, stating that they did not stick either on Bunny Hill or any other hill throughout the Trial.

THE MANAGEMENT OF ROADS BY COUNTY COUNCILS.

IN a paper entitled "The Suggested Future Management of all Roads by County Councils, and the Amendment and Codification of all existing Highways and Bridge Acts," read at the annual meeting of the County Surveyors' Society, held at the Guildhall, Westminster, on the 23rd ult., Mr. George Joseph Bell, the county surveyor and bridgemaster of Cumberland, said:—From various discussions at county council meetings on the question of main road management, it appears that many county councils have not yet arrived at any clear conception or idea of their duties with regard to a proper system of main road maintenance and repair, and consequently the different systems of management in force have been brought to the front in consequence of the increasing cost of maintenance under the contract system along with the visible deterioration of the roads.

It may be said, "We pay our surveyor for looking after the contractors and for seeing that we get value for our money," but a road contractor can veneer his work over in such a way that the average surveyor could not fairly refuse to certify for the work, which if refused would probably mean a lawsuit; and by this sort of sailing close to the wind from year to year the roads gradually become deteriorated, and at last it is discovered that a much larger outlay is required to restore the roads even to their original condition before the contractor was introduced. To supervise contractors thoroughly it would almost require a surveyor or clerk of works for each contractor.

Both systems are in force in the rural districts of Cumberland, but in the districts where the contract system is followed the roads are not nearly so good, and they also cost considerably more in the £1 than where the work is done direct by the rural district councils.

The contract system is a very comfortable way of managing the roads for the surveyor, but how about the ratepayers who have the money to find?

The rural main roads in this county have been managed direct by the county council from the first, and the steady improvement which has taken place on the old, worn-out turn-pike roads has raised a strong feeling in many quarters in favour of county management generally, both of main and district roads; and I see no reason why county councils should not undertake this further responsibility. It only means an extension of the system already in force in many counties; and if the ratepayers have to pay a higher county rate, they will be correspondingly relieved by a lower district rate. This change would get rid of a dual system and be the death-knell of many local jealousies, and tend to greater economy and efficiency in the management, and render possible such much-needed improvements as the easing of gradients, the rounding-off of corners, widening of roads and bridges, etc.

But to accomplish these transparent and necessary improvements the machinery of Parliament will have to be put in motion. All the existing Highway Acts require to be codified and amended, as well as the Acts relating to bridges, so as to bring all these different statutes within the compass of one or two handy volumes, for easy reference.

County councils ought to have the power to take over the management of all or any urban main roads where the county council think these roads are extravagantly and wastefully managed. Sub-sec. 2 of sec. 2 of the Local Government Act of 1888 requires reversing, and instead of a petty parish, which may have acquired urban powers, being able to dictate to the county council as to the main road expenditure within their area, the county council ought to have the power to say to an urban council, "You are wasting money on your roads, and from and after a specified date we will take them over and manage them ourselves." The mere fact of county councils having this absolute power would be sufficient to deter urban councils from incurring the wasteful and needless expense which many of them do incur at present, and so keep them in check and within reasonable bounds of expenditure.

Power ought also to be given to county councils to clear out all ditches and watercourses parallel to the roads and across any enclosed land, so as to secure the proper drainage of all roads: also power to acquire any land compulsorily, at agricultural value, which may be required for the purpose of reducing gradients, diverting roads and taking off dangerous corners, without the intervention of quarter sessions, so as to facilitate and encourage the use of mechanically-propelled vehicles on public highways, with power to borrow money to carry out such improvements.

From the practical success of the recent 1,000-miles run of motor-cars, from London to Edinburgh and back, it is quite clear that this form of road locomotion will shortly become general in this country, both for passenger, agricultural and general traffic, and the Queen's highways will then become more and more the arterial feeders of our great railway systems; but to secure the best possible results from this new form of traction on our highways county councils must have conferred upon them by Parliament more enlarged powers than those they possess at present, to enable them to cope with the increasing

MESSRS. SHIPPEY BROS., THREE-WHEEL ELECTRIC MOTORETTE.
(For description see page 115 ante.)

popular demand for a better class of roads and more in accordance with the requirements of mechanical traction, and the public are evidently prepared to pay for this increased accommodation herein.

A BILL has been introduced in the New York State Assembly, entitled "An act to regulate and govern the running and operating of all motor-carriages and vehicles other than railway or traction engines upon the highways of the State of New York." It provides that all operators of automobiles must obtain a licence from an examining board. Local boards in cities, counties or towns that pass on the qualification of engineers or inspect boilers are to constitute examining board. If no such board exists the supervisors are to appoint a person. Each owner is to pay an examination fee of \$1 in addition to a licence fee of \$2. The board is to grant licences to persons who upon examination are judged competent for a period of one year. The board is also empowered to revoke licences for a period not longer than six months upon satisfactory proof of drunkenness, incompetence and reckless driving. Persons violating this act shall be guilty of a misdemeanour, and upon conviction shall be subject to a fine of not less than \$10 nor more than \$100. The act is to take effect immediately upon its passage.

THE "NOEL" PETROLEUM-SPIRIT MOTOR.

—88—

AMONG the many types of petroleum-spirit motors displayed at the recent motor-car exhibition in Paris was the "Noel," made by Messrs. Fritscher and Houdry, of Provins (Seine-et-Marne), of which we are able to give illustrations (Figs. 3, 5, and 6) herewith. As will be seen, the motor is of the single-cylinder vertical type; it weighs just a little over 1 cwt., and is stated to be capable of developing 3 h.p. The ignition is electrical, while radial discs provide for the cooling of the cylinder. The valves are arranged on each side of the explosion chamber, the inlet valve at *s* and the exhaust valve at *S*. A feature to

FIG. 1.

FIG. 2.

FIGS. 3 AND 4.

FIGS. 5 AND 6.

which attention is drawn is the location of the sparking plug below the admission valve, such position, it is claimed, not only reducing the chance of miss-fires, but also protecting the plug from accident. Another point worthy of notice in connection with the motor is the introduction of an automatic exhaust valve *S'* in the end of the piston, through which the hottest of the consumed gases are emitted at the commencement of the exhaust stroke, leaving only the cooler burnt gases to be exhausted through the valve *S*. No secondary cam shaft is employed in the motor to operate the exhaust valve, this being done by means of a special cam on the motor shaft. The engine is provided with a centrifugal governor (*C*), which controls the piece *N* actuating the

exhaust valve *S*. If the speed of the motor becomes excessive the piece *N*, which is free to slide on the shaft, is displaced under the action of the governor, so that it no longer lifts the exhaust valve rod. The 3-h.p. motor, which is provided with an external fly-wheel, weighs 120 lbs. Messrs. Fritscher and Houdry are also making a 1½-h.p. and a 2-h.p. motor of the same type (Figs. 1, 3, and 4) which are, however, not provided with governors and which have flywheels located inside the oil-containing case. The latter is so arranged that the cranks and piston rod, etc., of the motor can be quickly opened out for examination.

THE SPLIT IN THE A.C.F.

—88—

AS was to be expected, the general meeting of the Automobile Club de France was a stormy affair. Baron Van Zuylen read the annual report to a very unsympathetic audience; there was nothing remarkable in it, nothing more interesting than a timid intimation that perhaps in four or five years' time the Club would be in a position to give substantial pecuniary assistance to the movement. It was received with a silence that could be felt, a silence that was made the more terrible by the spasmodic applause of the few who had the courage to support the chairman. When, however, M. Lehideux-Vernimmen had read the accounts of 1899 and the proposed budget for 1900, Paul Rousseau rose in his wrath and called on the meeting not to adopt the accounts, with shouts of "Divide, Divide!" "Let us leave the past alone," he said; "pass last year's accounts if you will, but let us have some explanation of this extraordinary budget, which presumes a profit of 100,000fr. and only grants 5,000fr. for the encouragement of automobilism. M. Querenet and others broke the uproar with a few words of help for the unfortunate committee, but nothing told against the firm attitude of the malecontents. The meeting broke up in orderly disorder.

The outcome of it all is that a new club has been formed, with the following well-known *chauffeurs* as its nucleus:—Messrs. Serpollet, Pierre Giffard, Paul Meyan, René Varennes, J. Berlier, Ernest Archdeacon, Riguelle, Cadier, Delaunay, Paul Rousseau, Hérard, Trouette, Ravenez, Marmottan, Desaché, Poussard, Duval, Léger-Dorez, Favreau, Joanny, Scotte, R. Lemoine, Draulette, Gautier, Desnues, Vinet, Legrand, Desmarais, Labouré, Sarrazin, Guyonnet, Gonnet, Godart-Desmarest, Mathieu, Malicet, Moussette, Debaugé, Buisson, Du Laurens, de la Barre, de Meaulne, Debray, Labat, Dr. Nitot, Caldas, Edwards, Gaillardet, Herburger, Boureau, Lesieur, de Lucenski, Wehrle, Noël, and Jaeggé.

The new institution will be called the Moto-Club de France, and will not be a club in the ordinary sense of the word, but a *société d'encouragement*, with offices, but no clubhouse. The conduct of the association will be entrusted to a committee, who will elect annually a chairman, a vice-chairman, and a treasurer; the secretary will be a paid official. The annual subscription will be fifty francs for town members, that is, for those who live in Paris and the department of Seine-et-Oise, and twenty francs for all others. Its object will be the encouragement of the automobile industry and the defence of the rights of the *chauffeur*.

THE Oxford Automobile Company has been formed at Augusta, Me., to manufacture automobiles. The capital is £12,000.

AN automobile club has been formed at Reading with Mr. Alfred Harmsworth as first president. The new club is arranging a two-days' Whitsuntide tour.

OUR correspondent "H. P." is informed that we hope shortly to publish an article on the subject of Tests of the Horse-Power of Motor-Cars.

MESSRS. G. G. TURRI AND CO., Salisbury Building, Queen Street, Melbourne, Victoria, are anxious to receive catalogues and prices from English builders of motor-cars.

ON Saturday the opening meeting of the Coaching Club was held in Hyde Park, when there was a large attendance of spectators in carriage and motor-car, and on horseback and on foot.

THE ROTTENBURG VARIABLE-SPEED GEAR.

WE have already alluded to the ingenious variable-speed gear exhibited at the recent Show at the Agricultural Hall by Mr. L. Rottenburg, of the Patella Works, Paisley. We are now able to illustrate the device (Figs. 1 and 2), and to give some additional particulars. The gear consists of two automatic

FIG. 1.—THE PULLEY AT ITS LARGEST DIAMETER.

expansible pulleys connected by a belt. The driving pulley on the motor shaft is constructed with expanding and diminishing spokes so arranged that the tangential pull of the driving belt tends to decrease the size of the pulley, while a very strong spring inside the latter tends to expand it. The periphery of the pulley is made in four segments of thin steel, suitably curved, and each overlapping the other. The tension of the spring can be adjusted so that the pulley can start closing at a certain fixed maximum load upon the belt. The driven pulley is constructed in a very similar manner to the driver, but the arms or spokes are so arranged that the pull of the belt tends to expand the pulley, so that as the force exerted through the belt becomes greater, as it does in hill-climbing, so the one pulley contracts—providing that the pull exceeds that arranged for the spring to withstand. The two pulleys are in the ratio of 1 to 3.3 to each other. The advantages claimed for the new gear are—(1) By setting the spring of the driving-pulley to suit the most efficient torque of a given motor, the motor, except on a light road, will drive a car a given distance with the smallest expenditure of energy. (2) The driver does not need to keep on changing the gear on an undulating road—it sets itself to suit the gradient; and (3) The driving-pulley does not allow the belt to get slack.

WE understand that the Earl of Durham has purchased Mr. S. F. Edge's Napier-Panhard car.

THE Malay Transport Syndicate, Limited, has been registered, with a capital of £3,000, to carry on the business of van, wagon, and vehicle builders and proprietors, carriers, suppliers of power for traction, etc. The first directors are J. W. Moore (chairman) and H. C. E. Zacharias. The registered office is at 93 and 94, Chancery Lane, W.C.

CORRESPONDENCE.

A MATTER OF POLICY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one who has for some months observed the course of the British automobile industry, and who is not interested in any one company more than another, I should like to ask whether it is not time British concerns ceased the costly experiment work to discover new vehicles, and kept themselves to manufacturing types that are doing well, and are sufficiently powerful for the present period of development.

I hear that one or two companies which have attained a certain measure of success are still allowing expensive ideas to be developed in their workshops, instead of confining themselves to the types with which their position has been won. Would it not be wiser to save on the former outlay and make profits on the latter, than to continue a policy which seems to me, as one on the fringe, to savour of the following of hopes the realisation of which is afar off?

Leeds, May 28, 1900.

Yours truly,
AN OBSERVER.

A MOTOR-RACING COURSE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As motor-car racing has been stopped in France by the authorities, and as from the first day that automobiles were allowed on the roads in this country their speed has been restricted, I now consider the time is fast approaching when we should have a motor-car racing course. There is no doubt that motor-car racing is a sport with a large future before it, and without going into this side of the question I consider that racing is an absolute necessity for bringing motors up to the highest perfection.

I mention a racing course, and do so by reason that it should not be less than five miles in circuit, and should have some stiff gradients. I do not suggest that the ground embraced by the course should be acquired, but merely the land necessary to build a road of sufficient width, say fifty feet. I can fully realise the cost of such an undertaking, but consider that motor-car

FIG. 2.—THE PULLEY AT ITS SMALLEST DIAMETER.

racing will immediately have such a following as to justify the founding of a course.

London, May 28.

Yours truly,
T. UNDERWOOD.

ELECTRIC IGNITION FOR GAS AND OIL ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I draw your attention to a slight error in the article on the above by an American writer in last week's

issue, and which appears to show that they are not so well posted on the other side of the Atlantic in past history of this subject. The earliest form of ignition was not, as stated, by incandescent tubes, this being introduced by Messrs. Crossley. The first explosive motor of any description, viz., Lenoir's French gas engine, employed a galvanic battery, therefore electricity was the first form of ignition. (See page 803, Vol. XII., Mackenzie's National Encyclopedia," condensed from "Rankine's Manual of the Steam Engine and other Prime Movers.") Considering the fact that Lenoir's engine has been claimed for Dr. Drake, of Philadelphia, as an American invention, it is rather strange such a statement should have been put forward.

Cranbrook, May 29, 1900.

Yours faithfully,

PRECURSOR.

THE AUTOMOBILE CLUB TOURS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your remark that it was "a rather doubtful advantage" for the route of the 1,000-mile Trial to terminate into London by way of Elstree only echoes the opinions that have been expressed by a great many; but to my surprise I see that for the Whitsuntide Tour of the Club it is arranged that the route to Peterborough is also *via* Elstree! To anyone with the slightest knowledge of the roads to St. Albans, this persistent shunning of the Great North Road is most mysterious. Can it be that some influential committeeman lives or has friends living in the Elstree district; if not, why are we to everlastingly thread our way through these narrow and tortuous lanes instead of taking to the broad high road?

Barnet, May 30th.

Yours truly,

BARNET.

[Our correspondent will see from the itinerary given in our last issue that the return journey of the Club's Whitsuntide Tour is to be made *via* Barnet and Finchley.—ED. M.-C. J.]

ARRANGEMENTS are in hand for the starting at an early date of a Scotte steam road train service between Valencia and Palanquinos, Spain.

ON Monday last a Daimler motor-wagonette was put up for sale by auction at Lowestoft. There was a good attendance, but the bidding did not reach the reserve, and the vehicle was withdrawn at £240.

WE understand that arrangements are in hand for the introduction of a large number of light Serpollet steam cars into this country. A first lot of four is expected to reach England by the end of the present month.

THE Banchory and Strachan Auto-Car Co., Ltd., has been formed to conduct and carry on the business of proprietors of motor-cars, motor-vans, and any other description of motor-vehicles, including motor-cycles, jobbing masters, carriers of passengers and goods. The capital is £1,000.

MESSRS. HEWETSONS, LIMITED, of 7, Dean Street, Oxford Street, London, W., have sent us a copy of their 1900 list of motor-cars, which gives particulars and clear illustrations of the automobiles on the Benz system for which they are agents in this country. We notice that the vehicles are now styled the "Hewbenz." They comprise the little two-seated car, a Victoria, a four-seated Duke, the four-seated "Emperor," dog-carts, a commercial car, vans, brakes, and racing cars. A couple of interesting illustrations are those showing the original motor-vehicle built by Messrs. Benz and Co. in 1885, and which was recently illustrated in our columns.

MESSRS. BROWN BROS., LTD., Great Eastern Street, E.C., have secured the sole agency for Great Britain and Ireland, for a new sparking plug, which has been named the "Elisa." The plug has a body made of one piece of nickel steel, the insulating porcelain being made of two parts. The advantage claimed for the new plug are that it can be taken to pieces instantly and repaired without special tools. There is said to be no loss of current, the compression tending to force the lower porcelain more firmly against the body of the plug. By employing two short and thick porcelain parts the cooling or heating of one cannot influence the other, consequently reducing the chance of breakage of the porcelain.

MODERN LOCOMOTION.*

BY SIR DAVID SALOMONS.

THE present age may be described as the age of locomotion. Our forefathers were content to be born and die on the same spot, much in the same way as many sea animals of unchanging habit live their lives attached to a rock.

For no obvious apparent reason, railways made their appearance, and with them the desire for perpetual motion was born in man. I say for no apparent reason, because it would appear that people generally were content to remain in the same place from the beginning of the world's history until the commencement of this century, and it is only natural to suppose that no great desire existed to move about from point to point before that time, or the means to do so would have been forthcoming. The last seventy years marks an epoch in the world's history, and without weighing the circumstances which have produced the revolutionary changes which we call "progress," the casual observer might come to the conclusion that the brain of man was suddenly developed to an extraordinary extent, and that many of the discoveries with which we are now familiar are more wonderful than anything that has ever been done in the history of the past. It is, therefore, not out of place to consider for a moment the probable real causes of the complete change which has come over the daily life of the present generation, due to the scientific and engineering developments of our time.

In expressing these opinions, I am ready to concede that everybody may not look upon the subject in the same light, and if any discussion is allowable on this paper, it will be as interesting to myself as to others to hear what has to be said on the point. The great advances which have been made are due in the first instance to the increase in population, which renders existence more expensive and more difficult. Consequently, it was necessary to increase wealth, and to effect this, locomotion was one of the first aids towards the end, to move labour to the point where it was most required, and to convey mineral and other products to places where they could best be dealt with. There was also the demand for large bodies of people to be moved to quieter spots when taking their rest. The demand exceeded the supply, and engineers gave the world improved machinery and better methods of locomotion.

At a later date the development of the wealth of the world exceeded the supply of labour, and improved machinery was called in to dispense as far as possible with human hands. This is undoubtedly the reason why the Americans have proved themselves so ingenious in regard to automatic machinery—it was the difficulty of securing labour at the time of the demand for manufactured produce that necessitated iron hands in place of flesh and blood.

Then again, looking on the side of pure science, which has made great strides in recent years, I cannot concede that this is due to better training, greater industry, or increased brain power over times gone by. In the olden day the scientific man had to work alone, he did not know what others were doing in a similar field, and half a lifetime was sometimes wasted in discovering something which had been done before, and of which he had no means of ascertaining.

To-day scientific men work like bees in the beehive, every individual taking advantage of the work done by his comrades. Cheap printing, journalism, scientific societies, and general intercourse has made this age utilitarian to them in common with others, and they waste but little time in re-discovering matters already found. Under such conditions, which may almost be described as an organised scientific factory, rapid progress can be made, but the brain power of man may degenerate in consequence of labour being so subdivided. This clearly will not alter the march of civilisation. It will only destroy the adaptability of the man and render him more and more a machine and less of an intelligent being.

Our engineers have done extraordinary feats, due to the possession of materials which were unknown in former days, and the two materials which have revolutionised engineering science are cheap coal and reliable steel. But for these engineering to-day would probably find itself in the same position as it was a century ago.

I venture to believe that the great men of the past will yet remain stars in the path of celebrity, and will remain mentally head and shoulders higher than any of the greatest men that we can point to in the present age, for their work from the beginning to the end emanated from their own brains, and in periods of intolerance, corruption, and religious prejudice. I will merely name half a dozen as instances—Moses, Alexander the Great, Plato, Cæsar, Galileo, and Newton.

I will now drop from what you may call the clouds of speculation to the more prosaic portion of my subject, and then rise again to speculation as to the future. The celebrated Lord Chesterfield said that no two men could be friends unless they had some subject of common interest to both, and therefore when among strangers it was important to ascertain what their interests were. This association, which seeks a cordial relationship with our French neighbours, has at least one subject in common, and it is one that is exercising the minds of both manufacturers and police at this moment—automobiles and their speeds.

For years past I have worked, as you may know, in my small way to increase the friendship between the two nations by bringing influence to bear on individuals on both sides of the water who are held in esteem by their fellow countrymen, and I feel proud that my exertions have met with considerable success, for the result has been the close friendship between the French and English automobile clubs. I do not make these remarks out of vanity, for in some measure it has been due to the chance

* A paper read at the meeting of the Anglo-French Association in London on Saturday, May 26th, 1900.

which guides many of our careers. A love of mechanics was born in me, and thus has brought me in connection with the new method of locomotion, and with it in contact with so many friends on both sides of the Channel.

No one more deeply deplores than I do the shameful financial transactions which have taken place in connection with self-propelled traffic, and which has done so much to weaken the confidence of the public in the movement, and I fear that it will continue to do so for some considerable time to come. But the demand for self-propelled vehicles in England is on the increase very slowly but surely, and you will fully recognise that the demand cannot be met in this country unless money is invested in the business, and the business must be honestly conducted. We shall, therefore, still see for a long time the importation of foreign carriages. This is a misfortune to us from the point of view of prestige and from the side of the user, because English-made machinery is decidedly better and more substantial than the cheaper articles made abroad, for the best foreign automobiles are far beyond the means of the ordinary Englishman. The purchaser has, therefore, not only to pay the value of the car but the expense of carriage and the profit of the agent, so that it is not unreasonable to suppose that all such cars sold in England cost at least 25 per cent. more than if these were made in our own country, quite apart from the question of whether they could be made better in England than abroad.

We must, therefore, look forward to a considerable reduction in the price of these vehicles from the day when properly organized manufacturing factories are started in England, with an honest capital to meet their requirements. This remark applies to the small type of carriage known as the voiturette. I doubt whether the large carriage will be greatly cheapened, on account of the great precautions which are necessary in their manufacture; but as soon as these can be turned out in series of fifty or a hundred or more at a time the cost of manufacture must be greatly lessened, though their production on a large scale will not depend on the manufacturer, but on the demand from the private user.

Motor-car racing, like horse racing, has done much to improve the breed, and the time has now been reached when road racing is considered a dangerous pastime from the public point of view; and if racing is to take place at all it must be on a private ground. However, sufficient progress has been made to enable satisfactory vehicles to be turned out, and the continual disturbing element of the past, which disorganised even the largest factories, viz., preparations for the race, may well be dropped for some time to come, and serious attention given to producing that for which a demand exists—a carriage which is comfortable, suitable for the purpose required, not likely to break down, and of types at prices to meet the majority of possible clients.

It is impossible to compare the progress which has been made in France with any progress which has or might have been made in England. The temperament of the two nations is so entirely different. The French, protected by the Government on every hand, are led like a child by its parents from birth to the grave. Any fresh excitement or novel experience is to the Frenchman like a new toy to a child, and no one knows how long that new toy will give pleasure or at what moment it may be cast aside as done with. The Englishman has, on the other hand, to rely on himself absolutely from the time he leaves school or college, and from his earliest days it has been his habit to weigh all sides of a question carefully before embarking on any project, however simple it may appear. Therefore, when an Englishman buys an automobile it is, with few exceptions, that he does not ask himself the question whether or not he can in some way get an advantage either in the form of making more money or reducing his expenditure. Another class will consider whether some special advantage can be obtained or increased convenience found by the possession of such a carriage.

I think there are few who will disagree with me in the proposition that the first great extension in the use of motor-vehicles will come from the commercial classes, and motor vans and wagons will be greatly to the fore at an early date. I estimate that the motor-van will do the work of six horses, with no more labour to the men in attendance; and

the expense of running such a van will be less than the maintenance of the horses and the rent of the stables.

Another class will take advantage of this mode of progress, viz., the professional man, particularly country doctors, surveyors, and others who have to cover considerable distances in the course of the day. Railways will also take advantage of engine-vans in the collection and delivery of goods. There will be a gradual displacement of horses by those who use driving for social purposes. There can be no doubt that where long journeys are made in the country for particular objects the horse will give way to the motor, even with those who are most prejudiced against it to-day. But it does not follow that those who can afford to keep horses for pleasure will discard them. They will, however, cast aside the horse in the mere drudgery work in favour of the more mobile vehicle, and the better breeds of horses will survive. The farm horse also must remain for field operations.

There comes the question what the motor-car of the future is to be—whether steam, electric, petroleum oil, or petroleum spirit. Engines worked with the last-named material have made such progress and have been brought to such perfection that notwithstanding many disadvantages, not the least of which is that of storage of the spirit, their use is fairly universal at the present moment. But it by no means follows that this will be the case in the immediate future. There are few to-day who will dispute that for heavy work steam is the best, and English experience bears this out by the fact that the number of steam vans in use is increasing every day for commerce. There is only one difficulty with steam for small carriages, and it is but a question of time when ingenuity will get over it. It is the boiler. In the steam van the boiler may have a considerable dimension, and the difficulty ceases to exist, but in the light vehicle no satisfactory solution has yet come to hand.

Many boilers in existence answer well for light carriages, but in every instance they are either quite inaccessible or troublesome to clean.

We must not despair if steam has not advanced so much to-day as other modes of road propulsion. Even if the exhaust steam is condensed and the water used over and over again, there always will be a loss, and fresh water has to be taken in. Oil will get into the water under the best regulations. We have therefore to look to two possible solutions of the small steam boiler difficulty. One is in the construction of the boiler itself, and the second is some means by which the water is not liable to produce any deposit whatever. The petroleum spirit engine possesses a disadvantage which apparently is inseparable from its use at the present time, viz., that it will carry very little more than its own weight. There is no doubt that the weight carried could be increased,

but a very small increase reduces the speed considerably; consequently at the same time the power of mounting hills is reduced.

Some years ago, before much attention was given to the subject in this country, I published various information combined with the suggestions in regard to this class of traffic, and pointed out that nothing less than ten horse-power per ton would be satisfactory on carriages to be driven at twelve miles per hour. At that time 3½ and 3¾-h.p. was in general use on foreign automobiles, and I was met with a good deal of ridicule from makers on the other side of the water for placing my standard so high. This standard was not a mere guess or hobby. It was founded on theoretical combined with practical considerations, and it is satisfactory to know that this very standard is adopted almost universally at the present time.

Recently the 1,000-mile Trial has been concluded with very satisfactory results, but viewing the matter as an expert this trial has been simply child's play. It was necessary in order to advertise the movement and familiarise the public with the method of locomotion which before long will be adopted throughout the country. Certain carriages, notably the "Panhard and Levassor" type, stood out to the front in these trials, but the public ought not to be deceived in regard to these vehicles. The best was a racing carriage costing from £1,200 to £1,500, everything being sacrificed to diminish weight. They may be compared to the racehorse with the saddle weighing but a few ounces, which would be found most unsuitable and uncomfortable for ordinary

SIR DAVID SALOMONS ON HIS PEUGEOT CARRIAGE.

Photo by

(G. Glencille, Tunbridge Wells.)

riding. If these 12 h.p. racing cars had placed upon them bodies for comfort, and hoods and other protection against rain, their speed performances would come down wonderfully.

I have myself a 12 h.p. Panhard carriage, not of the racing type, which is very comfortable for riding, but not capable of high speeds. I point this out to show the truth of what I say; that the benzine engine will not carry much more than its own weight if any reasonable speed is demanded of it. In using the expression "its own weight," I include the framework of the carriage and the wheels. These auxiliaries will be proportionately heavier as the engine itself increases in size. The Panhard and Levassor firm have met with such extraordinary success in all their racing experiences, for the reason that they have a good motor, first class jockeys, and devote great care and attention to the manufacture of their carriages; but in the races their attention has unfortunately been taken off many other points which add greatly to the comfort and convenience of the motor-car user. The majority of those who have this firm's carriages are more or less experts or good mechanics, but the time is rapidly approaching when their use will extend to other classes less experienced. To gain access to the valves of the engine is a troublesome matter in the "Phoenix." Many bolts and nuts have to be removed before access can be obtained. The new "Napier" carriage, English made, appears to be far superior to the "Panhard" carriage, and time alone is required to perfect it.

In the Peugeot engine points of convenience have been carefully attended to and by the removal of one screwed cover the inlet and outlet valves of a cylinder can be removed. To give an idea how convenient this is, I will relate an experience. In consequence of my Panhard having been laid by for several weeks the inlet valves stuck, and it was necessary to remove ten bolts to expose these. The mechanic was an experienced man, and he did this with considerable rapidity. All was replaced and the engine tried, yet the difficulty still existed. We had therefore to take it apart the second time, and the total operation lasted about twenty minutes. On the other side, a short time since, on leaving the gates of Broomhill to catch a train at Tonbridge, the engine of my little Peugeot car failed to respond. I believe the cause was due to cement dust from some building operations next door to where the carriage was placed, and which had got under the valves. The covers were removed and the valves cleaned and replaced without extinguishing the burners in the space of four minutes, and by running very sharp I caught the train. I do not give this instance with a view to puff one carriage and disparage another, but to show how necessary it is that makers should give attention to details which are of the greatest service to their clients.

The engine of the future will probably be on the Diesel type, which is superior to the steam engine from every point of view. All apparatus required for ignition is absent, the running is as steady as with steam, the cylinder does not require cooling, the simplicity is such that its cost must be small, and, lastly, the efficiency, as is the case with all petroleum engines, is between two and three times greater than that of the steam engine.

Mr. Crompton in a paper that he read stated that the limit of speed of a motor-car should be merely the function of the brake. In Utopia such a law might hold good. My experience in France has been that whatever the function of the brake may be, if the driver can send everybody flying off the road he will refrain from using it. I think myself that the speed in England being limited to twelve miles in open country is unreasonably limited, but for other places the law as it stands is good.

There is one matter relating to motor-cars in this country which I regard as eminently unjust. It is the tax which is placed upon them. All unprejudiced persons must admit that with rubber tires the wear and tear on the roads is practically nil. It is therefore not justice that more should be paid by the mechanical carriage than by the horse-drawn vehicle, and I think that redress might be given on this point if representations were made in the proper quarter, as it is unfair to tax a coming industry in this arbitrary manner.

Many of you may know that I have always been an opponent of pneumatic tires, except on the lightest form of vehicle and cycles, as I have always contended that attention should be paid to the springs, but I am ready to admit that anything will take the jar off the wheel will relieve the springs and give easier riding, and remove some of the wear and tear from the under carriage. If a pneumatic is to last on engine vehicles it must be blown out as hard as possible; in fact, from there to five atmospheres the square inch. Under these conditions, most of the advantages sought for to a great extent disappear, and all requirements are met by solid india-rubber of large diameter, the internal portion being soft and the exterior of hard rubber, and this has no disadvantage except in weight; even this will but slightly exceed that of a large pneumatic. For road racing the pneumatic tire, being somewhat lighter, may hold its place, and in districts laid with rough blocks of stone, as found in villages in France, the pneumatic may be an advantage if it is intended to proceed at high speeds over such roads; but against these small advantages the trouble and inconvenience connected with this kind of tire are so great that they would try the temper of an angel.

The gearing, which is such an important part of a carriage, has been devised in every conceivable manner, and although the belt system is perhaps the most pleasant for the occupant of the carriage it gives trouble at various times, mainly for the reason that the perfect belt and joint has not yet appeared. Personally I prefer for comfort as well as ease and safety direct gearing by cogwheels, and those systems which enable you to keep the teeth continually engaged are the best in practice.

Undoubtedly the best method of changing speeds would be by mounting every cogwheel which has to be employed for this purpose on a clutch. This would enable all speeds, whether high or low, to be put on without unclutching the engine and without shock. I believe the idea has been attempted, but the large amount of space required in the suggested arrangement precluded the idea being satisfactorily carried out, but I confidently believe this will be the plan ultimately adopted.

The steering mechanism is a vital portion of a carriage, as you must fully recognise. The methods at present adopted may be divided under four heads:—

- (1) The system of lever bars.
- (2) The system of lever bars actuated by means of a rotary motion with an intermediate chain.
- (3) By levers actuated by rackwork or cog-wheels.
- (4) Levers actuated by worm-wheel and endless screw.

The latter is the one now adopted in the majority of Messrs. Panhard and Levassor's carriages. No. 2 system is that adopted on the cars of Messrs. Peugeot. Speaking for myself, I prefer Messrs. Peugeot's system. There is less vibration, and guiding is far easier. Against this system it is contended that impediments on the roads react on the handle-bar and give shocks to the driver. Also that there is a risk of the wheels being moved from their course by the obstruction unless the handle-bar is held fairly tightly, but I can most positively assert that these objections are purely imaginary. In the early days, when less attention was given to details, there was some truth in the allegation, because the pivot on which the wheels turn did not plumb with the tread of the wheel on the ground. This is a most important point, and if the steering wheels are dished so that the points which touch the road plumb with the pivots, there is no tendency whatever for the wheels to be shifted by impediments on the highway.

A gentleman mentioned to me that he was riding a Peugeot car when the driver hit the kerbstone, causing the handle-bar to be sharply turned. This, of course, would naturally happen, but then it must be remembered that had the steering been on the endless screw principle the chances are that the wheel would have been injured or smashed. I have driven carriages which have been steered by other methods, and in all cases I find that there was disagreeable vibration on the handles, which rendered steering tiring after a time. With the endless screw this vibration is not noticeable until after the carriage has been in use a short time. Then it makes itself apparent in consequence of the wear and tear.

I am ready to admit that for racing purposes the endless screw is the best system, as the course can be altered very slowly by this means, so that a less experienced driver can race more safely. Anyone who has driven carriages with the various steering types mentioned discovers, almost at once, the extraordinary ease with which it is possible to wind in and out of traffic, however dense, with the system adopted in Messrs. Peugeot's vehicles—viz., intermediate chain system.

There is a question whether it is better to place the motor in connection with the back or the front wheels. Theoretically it is better to have the front wheels driven because it is better to start the carriage with these wheels placed at any angle. Except for this, there is not much to be said in favour of or against adopting this method. There is always a controversy as to whether one chain, two chains, or no chain is the best way of transmitting the motion to the driving wheels. Many methods exist for driving without a chain, and it is curious to note that some manufacturers claim that patents are good in connection with methods, the whole of which have been known and published as far back as the year 1820, mainly in connection with steam road carriages which first made their appearance about that time.

There is no objection to the use of driving chains if they are properly made. In some respects they have an advantage from the constructional point of view as well as convenience for making repairs. The only drawback to their use is that manufacturers appear to forget that the chain is nothing more or less than a flexible cogwheel, and although they take every care to protect other gear from dirt and dust, no measures are adopted to ensure these benefits for the chain, which is quite as complex as the other mechanism. The questions whether steering by means of the fore or rear wheels, whether four, six, or more wheels should be employed, whether the motor being placed in front or in the rear tends to skidding, etc., more or less, are matters too lengthy to discuss here.

We have at the present time advocates for the electric ignition and for the ignition tube. The whole of the manufacturers as well as users are gradually coming round to the use of electric ignition. The chief advantage to be obtained by this method is that a source of danger is eliminated, for the reason that no naked flame exists in proximity to any possible leakage of benzine, also that by the timing arrangement the maximum power can be got out of the engine, and a governing arrangement exists outside the governor. As an electrician, I naturally favour this method, but my experience has shown many drawbacks to its adoption which are exceedingly difficult to overcome, and although long journeys have been made depending on electric ignition alone I would not, where certainty is demanded, trust only to the electric spark. The magneto system of Bosch, improved by Mr. Simms, appears to be a step in advance, but more time with extended use is still required to prove reliability on all occasions and in the hands of all users. The objections to electric ignition are the following:—The source of the electric supply, the wear at the points where the spark appears, and the keeping up of proper insulation. The last-named difficulty is one that can be overcome. The first one is the most troublesome to cope with. Accumulators and primary cells are not satisfactory. You are never sure when the electric energy may give out. Neither the

accumulators nor the primary cells improve by being placed upon a shelf, so that if the carriage is put away for a considerable period, it is very doubtful what is the condition of the batteries. Some makers have adopted a small supplementary dynamo to keep up the charge of the accumulator or use the energy from the dynamo direct when the vehicle is running. This adds complication to the carriage, but is really the best solution outside the magneto system. The wear and tear and carbonisation of the points where the spark takes place is not a matter of great importance since the sparking plug can easily be replaced. In new carriages being constructed for me, I am having both systems installed, so that in the event of the electricity failing me on the journey the burners could in a short time be installed.

Engines to employ heavy petroleum which can be stored without danger have appeared from time to time. The systems adopted by Mr. Koch and others have met with considerable success, and it is probable that in the future heavy oil may be largely used when simple and satisfactory engines make their appearance and the smell produced by the exhaust can be suppressed to a considerable degree.

There are a vast number of other points which should be dealt with in a paper on Self-Propelled Traction, but on this occasion I will not do more than mention what they are—the various types of brakes, methods for cooling the cylinders, special forms of suspension springs, best methods for connecting the springs to the wheel axles in order to prevent the carriage sliding on the springs which has occurred in so many instances, wheel construction, methods which are or may be employed to enable vehicles to run round sharp corners at high velocities, lubrication, and possible methods of reducing air resistance.

I will say but a few words on the last point. The idea prevails that if the front of a carriage is made wedge, or boat, or conical shape, this is sufficient, but it is not so. The back of the carriage must be formed in precisely the same manner as the front, in order that the air rushing back after the passage of the carriage shall help to push the vehicle. The only cars I have seen in which this principle has been introduced are the racing cars of Bollée and the electric torpedo of Jenatzy, but even their methods are capable of some improvement. It is by the principle indicated that the fish moves in water with such ease; and has been copied for ships, though in this case, since half the vessel is in the water and one half out, the full advantages cannot be obtained. Since the motor carriage is entirely in the medium in which it moves that disadvantage vanishes.

For the moment, electrical carriages are not in the running. They have a use in level towns where charging terminals can be found and the distances to be traversed during the day are not great. In ordinary hands their maintenance must be considerable, since the batteries cannot be carefully examined, and after a few months use troubles begin, so that probably in the majority of instances the battery has to be renewed once a year, or more often according to the care which is taken with the plates of the accumulator. In the hands of an expert the battery should last two years or even longer. This means a large amount of care and attention.

As far back as 1874 or 1875 I constructed for myself an electric tricycle by combining a strong tricycle with a 1-h.p. motor and a number of Bunsen cells, secondary batteries not being known at that period. Of course, the tricycle had to be entirely rebuilt to carry the extra weight, and it ran satisfactorily, but the trouble of re-charging the battery led to the vehicle being put on one side. I regret that it was broken up soon afterwards and its component parts used for other purposes, so that what was possibly the first electric vehicle is no longer in existence. Some time after this an electric tricycle or quadricycle was made somewhat in the form of a skeleton voiturette by the E.P.S. Company about the year 1883 or 1884. I am not aware that any attempt at electric locomotion on roads was made between these two periods.

I have always had certain pet ideas for the future of locomotion, and by degrees they are being realised. The first step towards 200 miles an hour on rails has been taken. A Bill is now before Parliament for the construction of an electric railway between Liverpool and Manchester with a speed of 110 miles an hour. The idea of overhead wires along streets and highways capable of supplying power to electric carriages running on the common road without rails, which is quite possible, is now being realised on an experimental scale at the present Paris Exhibition. My notion was that carriages with motors should be built to hook themselves on by some suitable method to the overhead wires running along the highways. The motor could then be set in motion at pleasure by a switch on the vehicle and start in the usual manner. The current could be paid for by meter placed in the carriage, and all vehicles intended to run in this manner would have to be registered by the company supplying the current. The details of the electrical methods I need not trouble you with.

The question of moving roads has also obtained partial solution in the moving platform to be seen at the Paris Exhibition. All these ideas were published many years ago in various papers and articles, and I hope to live long enough to see them fully realised. I am ready to admit that in this paper a great many points have been overlooked, and on many matters which ought to have dealt with silence has been maintained, but I have said sufficient on the subject for this evening and many opportunities will arise in the future for discussing the various subjects left unmentioned this evening.

I conclude with the expression of the hope that the healthy rivalry which is about to commence, if it has not already started, between France and this country in regard to the automobile industry may continue, and instead of raising petty jealousies and political bugbears, a cordial and lasting friendship may result.

ALLEGED BREACH OF CONTRACT.

A CASE in which Mr. A. H. Barkworth, of Tranby House, Hesse, Yorkshire, sued the Automobile Association, Limited, for damages for breach of a contract to deliver to him a motor-tricycle, was heard on Tuesday before Mr. Justice Ridley and a common jury. The defence was that there had been no breach of contract.

Mr. Scott Fox, Q.C., and Mr. H. S. Moss-Blundell appeared for the plaintiff; and Mr. Shee, Q.C., and Mr. W. H. Stevenson for the defendants.

Mr. Scott Fox said that the plaintiff's case was that in November, 1898, he ordered from the defendants an Orient Express car at a price of £201 12s. The plaintiff paid £75 on account, and the order was to be subject to a satisfactory trial of the machine. Instead of a trial being made of the machine which was being built for the plaintiff, a car of a similar kind was used, with the performance of which the plaintiff was not satisfied, and he accordingly wrote cancelling his order and asking for a return of the £75. This the defendants declined to do, and after some correspondence the matter was amicably arranged by the defendants agreeing to supply the plaintiff with a Barrière motor-tricycle for the £75. This agreement was made on February 7, 1899, and the tricycle was to be delivered within a month. The machine was not delivered until April 4, and it was not painted according to the plaintiff's requirement. It was tried on April 8 by a Mr. Hayter, an electrician, who was advising the plaintiff in the matter, and after it had proceeded for about three miles something went wrong, and although the motor went all right the tricycle would not move. The damaged parts were sent back for repair on April 13, and were not returned until May 10. The machine broke down continually, and eventually the plaintiff wrote saying that he was convinced that the machine was not a new one. It was sent back to the defendants, and the plaintiff informed them that he expected them to give him a new machine. The defendants declined to do this, but offered to put the tricycle in working order. The plaintiff met the defendants' manager at the Automobile Show on July 7th, and the upshot of the interview was that the defendants promised to give the plaintiff a new Barrière tricycle. After this the plaintiff repeatedly wrote asking when the machine would be ready, and the defendants wrote making various excuses for the delay. At length the plaintiff placed the matter in the hands of his solicitor, who wrote on October 17th asking for a return of the plaintiff's money or else the delivery of a motor-tricycle. Obtaining no reply to this, the plaintiff's solicitor on November 4th wrote again, saying he was instructed to take proceedings for the recovery of the money. On November 7th the defendants replied that the tricycle was ready and could be seen at the Stanley Show. The plaintiff replied that he would go and see it without prejudice. He went to the show and saw a machine bearing a card stating that it had been made to his order. There was no one to show the machine, and the plaintiff, disapproving of it, tore the card off and threw it on the floor. His solicitor wrote saying that he was absolutely disgusted with the tricycle and asked for a return of the money, which was refused. The plaintiff claimed £89 5s. 6d., being the £75 in question and money paid for extras and repairs to the first machine.

The plaintiff was called, and bore out his counsel's opening statement. In cross-examination by Mr. Shee he said he took the card off the machine at the Stanley Show because he did not wish the London public to think he had been such a flat as to buy it. Mr. Shee: Do you know that tricycles of exactly similar pattern have won the hill-climbing competition and the long-distance competition? Witness: Well, one horse will jump a fence, you know, and another will not. Mr. Hayter said he was an engineer of thirty years' experience, and had taken special interest in motor-cars. A month would be a reasonable time in which to deliver a machine. The second tricycle, which he saw at the Stanley Show, was identically the same as the first. It was a second-hand machine.

On behalf of the defendants, Dr. E. E. Lehwess, a director of the company, said that he had tried the first machine supplied to the plaintiff himself. It ran splendidly, and he wrote to the plaintiff and informed him of the fact. If the machine had been properly driven and properly lubricated there was no reason why it should have broken down. It was not an obsolete machine; on the contrary, it was of the very latest pattern. The second machine, which was exhibited at the Stanley Show, was absolutely up to date. It was, in fact, a 1900 model. He had tried it, and it ran very well. There was no later improvement which could have been introduced into it. From the state of business in Paris it was impossible to get the machine sooner than the date on which it arrived. Further evidence was given for the defendants to prove the tricycle shown at the Stanley Show ran very well, that there was nothing the matter with it, and that four months was not a long time to wait for the delivery of a machine, one of the witnesses saying that five months would be a reasonable time, and that he had taken eighteen months in some cases.

On behalf of the defendants Mr. Shee submitted that when the plaintiff asked the defendants to give him a new machine instead of the first, what he wanted was the very latest fashion with all improvements, and that in the circumstances the time taken by the defendants to supply it was not unreasonable. Mr. Scott Fox, having replied for the plaintiff, his Lordship summed up the case to the jury, who returned a verdict for the plaintiff for £89 5s. 6d. Judgment was given accordingly, with costs.

RENAULT FRERES v. THE MOTOR-CAR COMPANY, LTD.

IN the Chancery Division of the High Court of Justice, before Mr. Justice Kekewich, this motion was heard on Friday last week. It was by the plaintiffs, Messrs. Renault Frères, manufacturers in France of motor-cars, to restrain the defendant company from passing off, selling, or attempting to pass off and sell motor-cars as motor-cars of the plaintiffs which were not manufactured by the plaintiffs; from making use of the character and reputation of the plaintiffs; and from advertising themselves as the sole agents in the United Kingdom for the sale of the plaintiffs' cars. The plaintiffs sold two cars to a third party, who in turn sold them to the defendant company. The plaintiffs found that the defendant company were exhibiting these two cars and another unfinished car of similar pattern, but not manufactured by the plaintiffs, as M.C.C. Triumph Cars. They also alleged that the defendants advertised themselves as the sole agents in the United Kingdom for the sale of the cars. Mr. Warrington, Q.C., and Mr. Israel Davis appeared for the plaintiffs; Mr. J. C. Graham for the defendants. Mr. Justice Kekewich said that on the evidence as it stood he could not doubt that the defendants were acting wrongly. First, he must conclude that the agent of the defendants had stated that the unfinished car, not manufactured by the plaintiffs, was the same as those made by the plaintiffs. Another point was that the defendants advertised themselves as the sole agents in the United Kingdom of a particular car. He did not doubt that that meant to tell the public that if they wanted a car of that kind they must come to the defendants. He was not sure whether, though wrong, that was actionable, because it could do no harm to the plaintiffs, though it might do harm to their agents. Another question was that, if the company put forward these cars as their cars, and so made a reputation for themselves, the result might be to form a market for their cars and oust the plaintiffs. His lordship said he was not in a position to deal with this question. It was not suggested that the defendants purchased more than two cars of the plaintiffs and labelled them M.C.C. Triumph, and it was not suggested that they intended to buy any more. The urgency of the case was small, and no serious injury could be done. On the whole, he should refuse the motion, and make the costs costs in the action.

THE CHARGE AGAINST A DIRECTOR.

At the Central Criminal Court, on Thursday last week, before the Recorder (Sir Forrest Fulton, Q.C.), Mr. Sydney Fredk. Atkins surrendered to his bail to answer an indictment charging him that he, being a director of the Automobile Association (Limited), had fraudulently misappropriated its funds. Mr. J. R. Grain and Mr. Peter Grain appeared to prosecute, and Mr. Charles Matthews defended. The case was tried at the previous sessions before the Common Serjeant (Mr. Bosanquet, Q.C.), when the jury failed to agree. At the previous trial Mr. Matthews submitted that the accused must be acquitted, on the ground that he had never been properly appointed a director under the Companies Acts. Mr. Grain replied that there was evidence to show that the accused acted as a director, and was consequently amenable to the charge. The Common Serjeant upheld that view, and said that, the accused having acted as a director, whether he was properly appointed under the Companies Acts did not matter, and he was liable to be indicted and tried. The jury at the previous trial having disagreed, the case came before the Recorder; and Mr. Charles Matthews then took the same objection to the indictment.

After argument, the Recorder held that, inasmuch as the accused was not in his opinion properly appointed as a director under the Companies Acts and articles of association of the company in question, he could not be indicted, as he was, as a director, notwithstanding even that he may have discharged directorial duties. Mr. Grain: Then if a man knows that his election is irregular and acquiesces in it, and then at a convenient moment goes away with the whole of the property of the shareholders, he cannot be prosecuted. I understand that that is what your lordship rules? The Recorder: Yes, it is. The law may be defective and require amendment, but that is the law. The indictment was, therefore, in his opinion, bad.

MOTOR-CAR ACCIDENT.

THE daily papers on Thursday reported that a serious motor-car accident took place at Lyndhurst, near Southampton, the previous day. Mr. and Mrs. Orris, St. John's-wood-park, London, and Mr. and Mrs. Rucker, who reside near Woking, left Bournemouth in the morning for London. On passing through Lyndhurst a pair of horses attached to a timber wagon shied at the motor-car, which, on being steered into the side of the road, overturned, severely injuring the occupants.

FURIOUS DRIVING CASES.

AT the Cambridge Police Court last week Mr. P. K. Smiley, undergraduate of Trinity Hall, was summoned for driving a motor-car at an unreasonable speed in St. Andrew Street, on the 9th December last.—He pleaded not guilty. P.C. Merry said that at five o'clock on the afternoon of Saturday, the 9th December last, he was in St. Andrew's Street, when he saw the defendant driving a three-wheeled motor-cycle from the direction of the Market Place towards Regent Street. He was

driving at a furious pace having regard to the large amount of traffic in the street at the time. Witness stepped into the middle of the road and called upon him to stop, but defendant appeared to take no notice of what he said. The defendant was fined £1 including costs.

At the Marlborough Petty Sessions on Saturday, Mr. D. M. Weigel was fined £10 and costs for furiously driving a motor-tricycle. Defendant, who was going at a speed estimated at twenty miles an hour, is said to have passed a doctor's trap on the wrong side of the road, causing the horse to bolt.

MR. ARTHUR COLLINS, of Drury Lane Theatre, has ordered an electric automobile from an American firm. He regards motoring as, next to steam launching and houseboating, the best recreation he can enjoy.

MR. W. WILLIAMSON, who has been traveller to Messrs. Allard and Co., Limited, of Earlsdon, Coventry, for a number of years, has been appointed to the position of sales manager to the International Motor-Car Company, of Great Portland Street, London, W.

THE Automobile Trust, Limited, has been registered by Mr. S. S. Ramskill, 40, Holborn Viaduct, E.C., with a capital of £100, to carry on the business of manufacturers of and dealers in all kinds of vehicles, whether drawn or propelled by animal, steam, oil, electrical, or other power, bicycle, cycle, and velocipede manufacturers, etc. Registered without articles of association.

It may be useful to automobilists in town to know that they will be able to obtain miscellaneous accessories as usual during the Whitsuntide holidays, the London Autocar Co., Ltd., of Gray's Inn Road, W.C., having arranged to keep their premises open as usual. The Motor-Car Company, Ltd., of Shaftesbury Avenue, W.C., have also decided to keep their depot open from 8 a.m. to 10 p.m. during the summer months. No doubt this will be of great convenience to gentlemen whose time is so fully occupied during the day that they have not the time to spare to inspect cars, etc.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, JUNE 9, 1900.

[No. 66.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

scenery like the Lake country or the Peak district of Derbyshire ; but, quiet and restful as they are, the lanes and roads of the localities traversed at Whitsuntide are admirable from the automobilist's point of view.

Motor-Driving Competitions at Sheen House Club.

which is to take place at Sheen House Club on Saturday, July 28th. Members of the club who would be willing to take part in these driving competitions are asked to communicate with the secretary at once, as the meeting will be abandoned unless it is clear that there will be sufficient entries.

Motor-Cars for Southampton.

For some time the Southampton Corporation has been considering the question of establishing services of motor-cars to act as feeders for the electric tramcars, and also of replacing the present horse-drawn omnibuses which are now, it is said, being run at a somewhat heavy cost. Before arriving at a decision the Council is enquiring closely into the subject, and one day last week a deputation from the Corporation proceeded in a motor-car to Bournemouth to enquire into the motor-bus service in the latter town. The result of the visit will, no doubt, be made public in due course, and as the opinion is strongly held that a quick service of motor-wagonettes at popular rates would possess distinct advantages over the present system of omnibuses, it is to be expected that their introduction at Southampton will not long be delayed.

Narrow Escapes in Ireland.

SOME Irish folks have been taking unkindly to automobiles, and writing to the papers to call attention to the furious pace at which motor-carriages travel. It is, according to some of these correspondents, no longer safe to ride or drive along the roads—especially that between Dublin and Bray—and one writer tells how a lady of his acquaintance “has already had three narrow escapes of being run down.” Instead of writing to

the Press in a sorrowful mood she ought to be happy at having thrice escaped the process of “running down.” For, according to general accounts, the roads in Ireland do not generally respond to a high rate of speed.

Looking for Better Things.

JUST before the Motor-Car Exhibition some people were heard to remark that they thought well of automobiles but would wait till the exhibition before purchasing. And so they waited awhile. At the exhibition they heard of the 1,000-mile Trial and waited again. This is a habit of mind which, while useful in some cases, does not always answer. For if everyone waited till something better turned up, inventors would have a very poor prospect. In fact, this attitude is perhaps best described in the following paragraph.

He waited too long.

ONCE upon a time a man saw a bicycle for the first time. “Ah,” said he, “I will have one of those when they are improved.” Long years elapsed, and when the pneumatic tires and other improvements came, he said: “They will be better yet,” but when motors came in he said, “This is better, and when they are perfect I will have one.” Poor man, he waited patiently for a “perfect” means of travel, but last week he was carried in a horse-drawn hearse to his last resting place. Thus, by waiting for the perfect article, he got nothing. There are many like him.

In the Dukeries.

VERY delightful was the recent trip of the automobilists through the Dukeries, and the beauties of Welbeck and Clumber were as keenly appreciated as was the permission to indulge in good speeds through those pleasant places. Doubtless many motorists will be seen in these delightful places during the coming summer, and they should make a note of the fact that the “open days” for the present year are Mondays, Thursdays, and Saturdays for the seats of the Dukes of Newcastle and Portland, and of Earl Manvers. Clumber, Welbeck, and Thoresby are a trio of pleasant associations and beautiful scenery without rival elsewhere in the kingdom.

Experiences Wanted.

THOSE who wish to get all the pleasure that is possible out of automobilism must become acquainted with its details, and by horizontal posing or other means know the “internals” of their car as well as its merits when running. Those who purchase motor-vehicles have much to learn after they have been shown how to steer and how to drive. After a man has “handled” a car for some little time he naturally begins to feel a pride in the mechanism, and much mutual benefit can be obtained by motorists exchanging notes of their experiences through the columns of this *Journal*, or in conversation. If breakdowns occur, as breakdowns will, drivers take pride in

telling just how they tided over the difficulty; how they disconnected a cylinder, patched the driving chain together, traced a short-circuit, or tied on a tire. Doubtless they soon learn, but unquestionably they would be better prepared for the emergencies as yet unencountered if each had the benefit of the other's experience. And in giving publicity to such practical points we shall be glad to assist automobilists to become more thoroughly acquainted with the ways of their cars.

Traction Engines at the Front.

A CORRESPONDENT of the *Times* writes:—"Some interesting figures are just to hand as to the work of the steam sappers with Lord Roberts. Seven of them have been at work for some time hauling stores across the bare veldt. Between them they do 5,000 ton miles of profit work per day, which is equivalent to each engine hauling 35 tons 20 miles daily. The cost of carriage by bullock train is 3s. 3d. per ton mile, so each engine is earning £114 per day. Its working cost cannot amount to the odd £14 even at war prices, so that the traction engine must pay for itself in ten days, or for itself and train and carriage out twice in each month."

Accidents in France.

Le Velo's statistical table of accidents caused by the principal means of transport during the month of April differs in no wise from its predecessors in establishing the fact that the employer of animal traction is subject to many dangers quite unknown to the user of mechanical means of transport. Commencing with the horse we find that he produced during the month 714 accidents, and that the consequent loss of life amounted to seventy. In the case of the automobile forty-six mishaps occurred, resulting in the deaths of three persons; while to the use of the bicycle can be traced sixty-three accidents, in which eight people lost their lives. On the railway the monthly record was forty-five accidents and ten fatalities. Thus one sees that whereas the noble steed is held responsible for 714 accidents during the month the united efforts of the three great mechanical means of transport were productive of but 154 mishaps, the number of deaths brought about being seventy and twenty-one respectively. From the end of April, too, writes our Paris correspondent, I fully anticipate seeing a marked reduction in the number of automobile accidents, for the rigorous measures adopted by the police have undoubtedly curbed the reckless propensities of the dare-devil class of driver, while the absolute necessity of securing a *permis de circulation* has temporarily deprived many *chauffeurs* of their mounts.

Railways and Automobiles.

MANY times have we emphasised the important part that the motor-car is likely to play with regard to railway development in the future. Of course, English railway companies are traditionally conservative and require much discussion before conversion; but that they will have to utilise the motor-vehicle as an adjunct to their lines in the near future is a belief in which every automobilist has faith. In America the Baltimore and Ohio Railroad Company has recently established a service of electric motor-vehicles, and these are now successfully running in Philadelphia. The extension of the idea to other railways will probably not be long delayed.

One Effect of the War!

THOSE American journals again! When will they cease to imagine strange things, and to give publicity to those of unconfirmed report? Here is an item culled from the news paragraph in an American automobile contemporary. "The heavy demand for horses for use in South Africa has caused an increase in the number of automobile delivery wagons on English streets. A correspondent of a London paper says these automobiles have been found much more economical by the tradesmen using them." Really!

Ladies and Motor-Cars.

Two years ago the only French lady automobilists who had attracted attention in the world were the actress, Madame Réjane, and Mme. Rothschild. Now, it is computed, there are more than five hundred ladies in Paris driving their own automobiles, and many of the drivers are ladies of eminence in the social life of the city. The vehicles are upholstered in every conceivable hue—blue, green, red, yellow, black, mauve, purple, white, and grey; and the fittings indicate a high standard of luxury. There is no doubt that ladies of every country are among the most enthusiastic of motorists, and, after a while, when the novelty has somewhat abated, English ladies will be found driving motor-vehicles in country districts—and occasionally in town.

An Inquisitive Equine.

FROM one of those voracious newspapers published in the United States comes a story which may be regarded as accurate or otherwise according to the scepticism of the reader. A citizen of Cincinnati—a great many stories of this class come from that town—left his horse and buggy outside the Grand Opera House, an electric automobile also standing by the kerb. The horse, it is alleged, began nosing about and in doing so turned on the current, with the result that the vehicle made a dash at the horse and threw him to the ground with dire results. The automobile rushed on its way until a bystander having a knowledge of its mechanism was able to mount it and bring it to a standstill.

In Police Service.

MORE believable than the above is the following account of an experience of the cycle trade of Cambridge. The other day one of their number suspected a client, who had hired a bicycle, of felonious intentions, and thereupon converted himself into a private detective. He shadowed his customer, and presently obtained evidence that an attempt had been made to dispose of the bicycle to a pawnbroker. Then the hunt commenced. A group of cycle agents made up the pack, and "nosed" in every quarter to pick up the scent, whilst a motor-car, with a real live detective as one of its crew, formed the field. The scent became hot about Milton, and the quarry was run to earth engaged upon his tea. He was brought back in triumph upon the motor-car, all concerned, except the prisoner, appearing to be well pleased with themselves and the demonstration they had given of the value of cycles and motor-cars as thief-catching appliances.

A Motor-Car as a Surgical Dressing Box.

FROM a French contemporary the *British Medical Journal* culls a remarkable instance of how Dr. Klein, while riding his motor-car in the neighbourhood of Sablé, was able to be of assistance to a road-mender who was found writhing by the wayside. On dismounting he at first sight diagnosed an epileptic fit, but after having had the sufferer carried to a neighbouring farmstead, he discovered a strangulated hernia. The symptoms having existed for some eighteen hours, and every ordinary method of reducing the rupture having failed, there was no resource but operation. The patient could not be removed on account of his weakness, and as his condition was becoming critical there was no time to return for anaesthetics and antiseptics. On looking at his motor-car, it suddenly occurred to the surgeon that in it lay the solution of the difficulty. He took from it some "essence" (probably the "petrol"), and washed the field of operation; he drew off some water that had been condensed in the cylinders of the automobile, and was therefore presumably sterile; he took some of the alcohol carried for the lamps, with which he disinfected his hand, and in the flame of which he sterilised his instruments and commenced the operation. After making an incision over the abdominal ring just large enough to

admit the tip of his finger, he cautiously passed along it the blade of a bistoury, with which he made a few small cuts, and dilated the parts with the other finger; the hernia was then successfully reduced. The wound was closed with an ordinary needle and thread sterilised in alcohol. He then took some of the cardboard and cloth which was carried to repair the joints of the water-pipes of the motor-car, made these into a pad which he boiled in the "essence," and, after it had cooled, applied to the wound and kept in position with a towel. Two days later he returned to his patient to find the wound healed.

The Mystery of the Motor.

SOME of the new humourists are finding in the motor-car a subject for fun and frolic with their pen. It is just as well that they can see the humorous side of the matter, for to the driver struggling with an obstinate engine in a market square there is nothing but a serious aspect. Mr. Barry Pain has, of course, been able to write pleasantly on the mystery of the motor, and in the midst of his tomfooling makes a point that

A MOTOR-CAR MEET AT SOUTHPORT.

deserves some consideration. "What is the use," he asks, "of talking rank engineering to a man who does not know a cam from a cog, or either from a cocoanut?" It is impossible to describe a motor-vehicle without descending into technicalities; but there are also parts of an ordinary carriage the designation of which is *caviare* to the man in the street.

A Hint to Business Firms.

THEN the humourist proceeds: "If a new bicycle or part of a bicycle is produced you are pretty certain to get a pamphlet about it which will interest you and make you understand it—which is put so clearly that it would make a canary understand it." That is, to a certain extent, true, but it is to be remembered that motor-vehicles are not of purchasable interest to everyone; and although the "new humourists" may be in the class who are on the look-out for motor-vehicles, there are thousands finding pleasure in cycling to whom motoring is a luxury afar off. At the same time, those in the motor trade might well do something in the direction suggested, and by a more liberal use of sectional drawings and sketches and photographs of parts, render the mechanics of the motor more generally known. For the diffusion of such knowledge would enlarge the circle of those who can comprehend the principles of automobilism; and an acquaintance with principles will, material matters considered, do something to persuade towards purchase.

A Motor-Car Meet at Southport.

ONE of the most enthusiastic *chauffeurs* in the Lancashire district is Mr. L. Williamson, of Southport, who has kindly sent us photographs of the two illustrations given this week of a motor meet recently held at this popular seaside resort. In sending us the photographs Mr. Williamson, who is seen in his Daimler car in one picture and on an Orient Express in the other, writes regarding the meet, "It was merely organised at my invitation for the purpose of obtaining photos of our locally-owned cars, and that the owners might indulge in a few hours' 'petrol talk.' The cars, after the photos were taken, had a short run in company in order to impress upon the horse-loving persons that they are not the only users of our highways." The example set by Mr. Williamson might be followed with advantage in many other provincial districts. It is surprising what a bond of friendship springs up under the action of "petrol talk," and many pleasant little runs might, as a result, be made in company if only someone will take the initiative in getting local automobilists together.

A Well-known Southport Automobilist.

MR. WILLIAMSON has quite a large stud of automobiles, to which he is now adding a 12-h.p. twin Daimler, with which he hopes "to have good luck." This is the result of the success he has had with his 6-h.p. Daimler which he drove during a part of the recent 1,000-mile Trial. Mr. Williamson regretfully left the route at Bradford, and arrived safely at Southport after having covered a distance of 500 miles without experiencing a single hitch.

An Interesting Lecture.

THE members of the Automobile Club of America recently listened to a very interesting address by Professor Thurston, of Cornell University, one of the leading American authorities on the steam engine. The author reviewed the early history of the automobile, and gave an idea of the perfection attained in the early thirties in the construction of steam vehicles that was probably new to many of his hearers. He pointed out that the line of steam automobiles had not been broken from that day to this, and recalled a ride he took in a steam automobile about 1860, going out from Boston for a half day's trip; also the vehicle built by Roper and the steam

fire engine built by Ericson, which was propelled by its own power, and even made the trip from New York to Philadelphia. The different kinds of power now receiving attention were considered, and steam, electricity, and petrol each given a place. Compressed air could not at the present time compete with the heat motors in economy, while liquid air could compete to an even less extent. He gave some interesting facts regarding the construction of automobiles and the properties of the metals used in their construction. In conclusion he said that the automobile can now be operated with no more danger than the horse-drawn vehicle; a greater range of speed is obtained, and the length of the route is unlimited with certain kinds of power; it operates equally well on all kinds of roads with the horse-drawn vehicle; in construction there is less liability to derangement and breakdowns; its cost and maintenance is less than the horse-drawn vehicle; it is to be preferred from a sanitary point of view; its tires will improve the road where the hoofs of the horse injure, and the automobile has also the advantage of more quiet running.

Restricting Invention.

ALONE among the London evening journals the *Echo* finds room for the growls of grumblers and the views of faddists of every variety. One of its recent correspondents signing himself "Cyclist" has written to the effect that many of our main roads have "a tragic record of motor-car accidents," and such a declaration is printed without contradiction or even a note of interrogation. Then this wiseacre makes a suggestion the adoption of which would, he considers, render the roads safe for pedestrians and carriages. "I would suggest," he says, "as the surest remedy that could perhaps be devised that every motor-car constructed should be fitted with an engine of maximum speed—power not exceeding that required to travel twelve or fourteen miles an hour—or the limit allowed by law; and that the provision of any power beyond this limit should render the manufacturers liable to prosecution." Just fancy; here we are within six months of the twentieth century and the editor of a London journal allows a correspondent to advocate a barrier to mechanical invention and a stop to engineering enterprise. We can hardly credit that such a suggestion would have been allowed in anything but an *Echo*—an echo of the dim light in which invention groped ages ago.

Motor-Cars and the Mails.

EXPERIMENTS that have been made in conveying mails by motor-vehicles should have convinced the postal authorities of the economy, efficiency, and regularity of such a method of performing their work. But tradition still rules, and every now and again some mail-cart driver is summoned for cruelty to his horse. A typical case has just been heard at Tunbridge Wells, where a driver has been convicted. He urged that the Post Office authorities did not allow the drivers sufficient time in which to do the journey. They had sometimes to drive very hard to reach various points at the appointed times. He admitted driving his horse, which had previously fallen and cut its leg badly, four and a half miles in thirty-five minutes. Were motor-vehicles employed such instances of cruelty to horses performing public services would be unknown, and a great saving of time and expense would result.

At Skipton, on Saturday last, Mr. T. Scaife, engineer, of Leeds, was charged with not giving "audible warning" of his approach. Defendant was in charge of an 8-h.p. motor-car, containing seven passengers, in the neighbourhood of Bolton Abbey, and was, it is stated, the cause of two horses bolting. The motor-car also ran into another carriage, breaking one of the shafts and a spoke. Defendant, who did not appear, was fined 20s. and costs.

THE SPLIT IN THE A.C.F.

(From our Paris Correspondent.)

THE annual general meeting of the members of the Automobile Club of France has been held at last; and what a truly pitiful affair it proved to be! There was a party—a strong party—in opposition to the club committee, but it lacked organisation, and the result was unhappy in the extreme. Everyone was shouting, talking, and gesticulating violently at the same time, and no one single subject received ten minutes' consecutive consideration. While one speaker was criticising the balance-sheet, another was condemning the budget, and a third objecting to the proposed changes in the club rules, the whole to the accompaniment of a confused babel of cries. Anything more lacking in dignity cannot well be imagined. And what was done? Nothing—absolutely nothing, after an hour and a half's tumultuous confusion, at the end of which time the president declared the meeting to be closed without taking any actual vote upon the hotly-discussed question of the budget. What a farce! To my mind, it is well to have an opposition party in every society, provided they work for the society and not for their own ends, as it keeps the administration up to the mark, if only by fear of criticism; but such an opposition must be organised and not a rabble. The dissatisfied members of the "A. C. F." had every right to discuss the budget item by item as they desired to do; but they did not go about the business in a proper manner, and it is not surprising that they missed their object. A provision of £200 on a budget of £14,440 is hardly an adequate allowance for a Société d'Encouragement to make to the industry which it is expected to foster, and this was the point in the budget to which the strongest exception was taken. But surely a little calm, cool-headed discussion would readily have put this matter right without having recourse to any such extreme measures as a wholesale secession from the club, and the corresponding amount of public criticism, which can have but one result—the weakening of automobilism. I do not say that the secessionists are entirely to blame, for the administration did not at the meeting give one the impression of welcoming criticism; indeed, they adopted a very high-handed tone with regard to the proposals thrown out by the opposition, albeit that those proposals were not put, perhaps, in the most acceptable form. Anyhow, it appears to be too late in the day to mend matters now, and perhaps, after all, the formation of the Moto-Club de France will prove to be a blessing in disguise to the "A.C.F." Speaking with one of the founder members of the new society, he told me that many of the promoters had no intention of resigning from the "A.C.F.," as the new club, not being a club at all, would in no wise clash with the interests of the older society; but to what extent this feeling prevails I am unable to say. In any case, I believe that the members of the Moto-Club will find that they have a hard up-hill fight before them, and that it will be a long time before they can render any really material assistance to the industry—much longer, indeed, than it would have taken to induce the administration of the "A.C.F." to amplify their provision for the current year had the representation been properly put forward. Of the twenty-five members, which the new society has decided shall constitute the committee, the following fifteen have already been elected:—MM. Serpollet, René Varennes, Pierre Giffard, Paul Meyan, Berlier, Cadier, Paul Rousseau, Delannay, Du Laurens de la Barre, Hérard, Riguelle, Trouette, Vignat, R. Lemoine, and Corlin. The movements of the Moto-Club will be watched with interest, as will also the "A.C.F.," in regard to the industrial side of automobilism. The industry should benefit from both sides, and let us hope that it will.

Is *Punch* also among the automobilists? Last week's issue contained a drawing of a gentleman going to Epsom on a Peugeot Voiturette. "To make sure of arriving there," remarked our contemporary, "he thought it only wise to bring his horses as well, in case anything 'went wrong with the works.'" Behind the car the two carriage horses were represented as trotting gaily along.

The Automobile Club's Whitsuntide Tour.

LAST year the Whitsuntide tour of the Automobile Club was through Shakespeare's country, and this year a route through the Eastern Counties was chosen. As already announced in these columns, the way was through Peterborough, Norwich, and Cambridge, thus giving participants a goodly view of the Fen country. With such a course good weather was the only remaining factor required to attract a large gathering, and all anticipated a pleasant time.

But alas! the weather on the morning of Friday, June 1st, was not good in London; and as those who had intended taking part in the tour looked out from their windows in the early morning, their hopes became depressed and their spirits were

A VIEW NEAR NORTH WALSHAM.

dampened. It rained. Not a showery, fitful summer drizzle; but a steady and substantial downpour that might have been regarded as characteristic of April, but was certainly out of place in June—and certainly very objectionable at the commencement of a tour, the success of which was so dependent on King Sol and his smiles. But such was not to be at the start, and we did not anticipate many cars would be standing on Horse Guards Avenue as we went to the headquarters of the Automobile Club. Not only did the rain descend, but the wind blew coldly, deterring many from entering upon the journey. We got to the club-house just before ten a.m.—only one car, that of the secretary, being there before us. With praiseworthy punctuality Mr. Johnson mounted his car at ten o'clock, and with Mr. Bruce as passenger went off on his Whitsuntide pilgrimage. Several other motorists were waiting and watching for signs indicating a change in the weather. But no manifestations came and even the weather-wise were unpropitious. Messrs. Butler and Sturmev were of the number, as were Mr. Stanton and Mr. Pedley on Daimlers and Mr. Edge on a De Dion voiturette. Then came Mr. Mark Mayhew on his 8-h.p. Panhard, with Mr. Cohen aboard, and Mr. and Mrs. Buttemer following on a Benz car.

Despite the watery outlook these were duly started, and at a quarter past ten our party—the writer, Mrs. Cordingley, and Miss Pursehouse—decided to go by train to Bedford and there to commence travelling by motor—should the weather not prove too unkind. So in a commonplace cab we went to the station and by one o'clock had reached the Swan Hotel, Bedford—the rendezvous for lunch—53 miles from town. No car had yet arrived, but twenty minutes later Mr. Mark Mayhew was the first who had motored from Whitehall to appear at Bedford.

The weather was as delightful in Bedford as it had been depressing in London, not a drop of rain having fallen. We learned, too, that after leaving St. Albans—23 miles from London—the road had proved to be in splendid condition, and that there had been no rain to lay the dust. That was apparent from the aspect

presented by the automobilists as they appeared. At the same time there had been a strong head wind, almost sufficient to bring the cars to a standstill. Very satisfactory was the report that our own car was coming along in good style, and was only a few miles behind. It arrived at 1.38, having been delayed nearly an hour owing to a stoppage to grind the valves. Twelve minutes after two Mr. Johnson appeared, having made a long stay in St. Albans, where he spent some time with the telephone. As the motorists arrived they all told similar tales of trouble with restless horses, and in some instances, exceptionally bad-tempered animals had been met, requiring the stoppage of motors, the backing of cars, and other careful manipulation by their drivers. One or two Shire horses seemed to be particularly vicious, reeling and careering wildly in the air, to the dismay of passengers by motor-car. At Bedford, Mr. Grimshaw, on a tricycle, joined the party for luncheon, and Mr. White also drove into the courtyard of the hotel, having driven down from London on a twin Daimler.

About half-past three we left Bedford on our car to complete the rest of the day's journey—38½ miles—and arrived at the Great Northern Railway at Peterborough at a quarter to six, having had a good run on capital roads and with a strong head wind. But there were no stoppages and no incidents to chronicle. Between the sixty-fifth and sixty-sixth milestone on the Great North Road, at 4.27 p.m., Mr. Edge on his new 6 h.p. motor-tricycle came up with us. He had left London at two o'clock and had seen none of the party on the way. He turned his machine back to look for them, but evidently gave up the quest after awhile, for at the seventy-fifth milestone he passed us, having failed to see any other car. At Norman Cross we saw a very handsome Daimler wagonette, painted yellow, and being used to advertise someone's choir and a scenorama, while two miles before reaching the Cathedral city, whither we were going, we came up to Mr. Hutton's four-cylindrical Panhard. Mr. Hutton had Mr. Cartis with him and was waiting for the cars. He had

ON THE BURE AT WROXHAM.

driven over from York, his car "going great guns," and the wind behind blowing in equally strong fashion.

Having reached Peterborough we were able to await the coming of the others. About seven o'clock Messrs. Butler and Sturmev arrived, having had a long stay at Biggleswade. From them we learned that Mr. Mayhew was not far behind contemplating a punctured tire, and Mr. Johnson had kindly stayed with him to assist in the repair. News also came that Mr. R. E. Phillips, who was accompanied by Mr. Thwaites, was having trouble with his Petit Duc. About 9.30 p.m., Mr. Simms, who had left the club-house just before eleven in the morning, reached Peterborough. Early the

next morning Mr. Hankinson came over from St. Neots on a tricycle in time for breakfast. Both that gentleman and Mr. Simms left Peterborough on Saturday, and neither were seen again on the tour. The roads from Bedford to Alconbury Hill were flat, but afterwards they were of a switchback description, with easy gradients up and down. Unfortunately the weather was bitterly cold, and the fires in the various rooms of the hotel were much appreciated.

THE SECOND DAY.

Saturday opened dull and gloomy, with every prospect of rain. Unfortunately for the tourists, appearances were not deceptive, as was quickly discovered. We started just after ten o'clock for King's Lynn—a distance of 34½ miles—and arrived at the hotel at 12.30, after having been sent in a wrong direction round the back of the town over some execrable *pavé*. The roads were beautiful, except for about a mile or more of newly laid metal just outside of Thorne, but it rained continuously and hard all the way. Through Wisbech a wrong turn was taken, but this being soon discovered, we were again by the waterside where, by the way, a body was being recovered as some of the motorists passed. Horses were again very troublesome, and numerous flocks of sheep were passed, it being market day at Wisbech. In the hotel yard at King's Lynn we first saw Mrs. Kennard on her quad, which she was driving and steering, her lad occupying the comfortable front seat. The Hon. C. S. Rolls, with Dr. Hutchinson as passenger, was also met for the first time, both being smothered in mud. Mr. Hutton's car being minus a mud guard to one of the front wheels, was in an even worse state, and had to have the thick deposit scraped off. Mr. Frank Morris, of King's Lynn, was well *en evidence*, riding a new Parisian Daimler, and he afforded every assistance, being good enough to pilot several of the cars out of the town.

Having arrived first at the hotel, we left early for Norwich, the end of the day's journey—distance 43½ miles. Just before entering Swaffham Mr. Hutton passed, and afterwards Mr. Butler; but later on we passed Mr. Hutton by the wayside, a burst tire causing the stoppage. By invitation of Mr. and Mrs. H. Egerton a halt was made at Weston Rectory for tea, and some considerable time was spent in admiring the grounds, photographing, etc., by the owners and passengers of the seven or eight cars present. We here learnt of a painful incident which happened to Mr. Rolls. It appears he was riding along at his usual pace, wearing close French glasses, when by some means or other a bee got underneath and stung him by the side of the eye, which immediately began to swell. Fortunately, Mr. Rolls' passenger was a doctor, who adopted heroic means of removing the sting. A nasty scar was left, but the swelling subsided.

The latter part of the day was fine but dull, and the roads were good. Several punctures happened to the pneumatics, while Mr. Phillips still had trouble with his chains. Messrs. Lord and Swindley joined the party at Norwich, and Mr. Estcourt, on his new Daimler, made his appearance in the evening, and then we did not see him again till he was entering London on Tuesday. Most unaccountably the horses were still troublesome, and in fact the restive horses on any one day caused more fuss than the whole of the horses met in the Thousand-Mile Trial.

The Maids Inn at Norwich proved a pleasant enough place, the hotel being one of the oldest in the kingdom—yet, withal, up

to date with its sanitary arrangements and electric light. The landlord and landlady both ride motor-tricycles, and the former holds high positions in the National Cyclists' Union and Cyclists' Touring Club (besides which he was known to many of the party), therefore it follows we were made comfortable, the only jarring note being the extortionate charge of 3s. per night for stabling motor-cars. Sunday was an off day, but by common consent Cromer was fixed upon for a short run, and as the day was as bright and warm as Friday was cold and wet, the whole party made their way by different routes to that beautiful seaside place. The roads here, as elsewhere, were in an ideal condition, and the scenery passed through was most beautiful—the country being at its best just now. Our way to Cromer lay through North Walsham and the Broads, and as we reached the entrance to the Links Hotel, just immediately in front of us, coming from the opposite entrance, was a party of motor cyclists, consisting of Mr. and Mrs. Edge, Mrs. Kennard, Mr. Jarrott, Mrs. Clarke, etc. Here we heard that Mr. Roger Wallace was on his way on a motor-tricycle, but we did not meet him till night at Norwich. A long stay was made at Cromer, and then a move was made for Wroxham Broads, where some wherries had been chartered. The Norfolk lanes are many and winding, and although signposts are plentiful, we managed to lose our way. Asking a cyclist for the direction, he informed us we had come over six miles out of our way, and on our remarking that this meant a loss of ten minutes (!), he could only remark, "By gosh!" The missing of our way did not matter in the

least. The lanes were leafy and sweet, the roads good, and the motor—with its heavy body on and four passengers—pulling grandly, seeking, we suppose to make amends for its unruly behaviour on the thousand miles. We met Messrs. Butler, Bruce, Johnson, and Sturmeay at Wroxham, and after waiting some time, embarked on two wherries, and had an enjoyable two hours' sail. Norwich was reached at eight o'clock, and dinner partaken, as arranged, half an hour

MOTORISTS ON THE BROADS.

later. The opinion of those participating seemed to be that the present Sunday was a red-letter day in the history of the Club's many pleasant tours, and amply compensated all for the previous two days' wet and cold.

Certainly the contrast between the ancient old city of Norwich and the modern resort of Cromer was very striking, and without the motor-car it would have been impossible to have travelled over such roads and through such lanes in the time at our disposal. For not only were we able to enjoy the ride, but, in the boating on the Broads, were able to add to our pleasures to no inconsiderable extent.

Norwich looked well on Monday morning, and there was plenty of sunshine, which, coupled with the fact that the day's trip was not to be anything great, inclined us to delay the start. Mr. Johnson was the first to go, Mr. Wallace, on his tricycle, starting off with him. In Thetford we went to the Suffolk Hotel, at the sleepy old town of Bury St. Edmunds—forty-one miles from Norwich—where we arrived at five minutes past one. We had left Norwich at a quarter to eleven, and had gone through without a single stop—a typical instance of the good behaviour of our car throughout the trip. As was the case all through the eastern counties the roads were of first class description—a remark that does not apply, however, to those in the city of Norwich. The journey was practically devoid of incident, except that at one point a crowd of

small boys shouted lustily as we passed, and held up something which looked like a motor screw. On stopping to investigate it proved to be a thumbscrew for holding in the oil at the base of the crank chamber of a motor-tricycle. Proceeding a mile or two on our journey, we saw Mr. Wallace retracing his way, and we had the pleasure of handing that gentleman the missing screw.

At Thetford we passed Mr. Johnson repairing a puncture, but as the work was just finished we were soon passed in our turn. A pleasant time was spent in visiting the churches and abbey, and no other cars appearing we proceeded to have luncheon. At Bury Mr. Johnson returned to Thetford to find out what had happened to the missing cars, and discovered that a wrong turning had been taken at Thetford. We proceeded to Cambridge, arriving at the Bull Hotel about five o'clock, afterwards visiting Dr. Hutchinson in his charming house at Woodlands Avenue. Several punctures happened, one occurring to Mr. Hargreaves right in Cambridge, while the news of a smash up of a trike by collision with a lamppost was received. As far as Norwich we had been troubled by restless horses, but from that place to Cambridge we did not meet half a dozen horses, and these were of the most docile kind.

Tuesday saw the break up of our party at Cambridge. Two or three cars left early in the morning; one returned *via* Oxford, and we came back *via* Ware and Barnet, where we lunched. Mr. Hutton was the first to report himself at the club, and that was between one and two o'clock. Regarding our car, we may mention that, excepting the single stoppage for valves on Friday, it ran through on every occasion from point to point without hindrance.

THE POPULARISATION OF THE MOTOR-CAR.

BY TRADE-VIEW.

MANY cycle firms are now developing an interest in motor-vehicles, and recent Trials and annual runs have shown how the new form of locomotion on roads is becoming a practical and permanent institution. The attention of the public has been called to the subject in a general way; but the interest is cursory and often transient. They have seen the cars, have heard them, have—in some cases—smelt them, and their impressions have varied according to the condition when seen. The village blacksmith who has helped to repair a vehicle in distress naturally regards it in a different light to the people of Welbeck, who were able to see the speed trials in which a dozen motor-vehicles whizzed by at thirty and more miles an hour.

What is now required is that the general distracted interest should be particularised. The vehicles having been seen is one thing; the next step should be to secure that people should ride on them. A trip of a few miles on a motor-vehicle is better than writing and conversation to establish the fact that automobilism is not connected with nerve troubles. Having conceded that motor-cars can go and do go, there are sceptical persons inclined to believe that a ride on a motor-vehicle is a long series of vibrations, and a very uncomfortable method of travel. They can only be assured to the contrary by actual experience.

In this work agents and others in the provinces and the suburbs can do much, and a systematic education of certain classes of people in every locality throughout the country would be of great value in the popularisation of the automobile. A few elementary hints will suggest others. Roughly, the people to be interested in automobilism are of four varieties—viz., (1) the official classes, in which I would include magistrates, town and urban councillors, borough and county surveyors—and coroners; (2) professional men, such as clergymen, lawyers, doctors, and journalists; (3) local gentry, including manufacturers and others who spend spare hours in various pastimes; (4) the commercial class, embracing smaller manufacturers and the better class of retail tradesman. So far as prospective motorists are concerned the world can thus be quad-divided and attention concentrated on these classes of people.

For purposes of practical utility the order in which they are set out will suffice for the firm opening up a local connection for the automobile industry. An invitation should be specially

addressed to individual members of the local authorities inviting them to take a trial run. The acceptance of such an invitation would afford opportunity for demonstrating to magistrates and councillors the absolute reliability of the vehicles and the stern control that the drivers can exercise. These points cannot be too widely enforced or reiterated for there is still considerable latent opposition to the development of the industry in some of the sleepier towns. When applications for licences to ply motor-vehicles in sea-side towns come before the local authorities a far more favourable hearing can be expected when those in power have some acquaintance, however slight, with the running powers of motor-cars. If every agent throughout the country would carry out this suggestion we should have considerably less opposition than is now the case.

The second class—viz., professional men, such as doctors, clergy, and lawyers—should be similarly invited to ride motor-vehicles, not so much with the idea of securing a friendly consideration with regard to speed regulations, etc., as with a view to securing actual purchasers. Within the last few months the medical press has given much attention to the advantages of motor-vehicles for country practitioners, and at the Agricultural Hall Exhibition doctors formed a large proportion of the public attendance. Hence opinion in the medical profession is being inclined towards automobilism, and many a halting view might be turned into purchasing acquiescence by actual experience. Here, then, is every hope for business—and a few days devoted to giving every professional man in the neighbourhood a ride on a motor-vehicle should prove a valuable advertisement, giving results not long delayed.

With regard to the press every agent should quickly recognise the value of devoting a few hours to taking local journalists for short trips. They may get into confusion when describing vehicles, as was freely shown during April and May; but the publicity they give is valuable in helping the progress of automobilism. Just as public men frequently depend on the press for their reputations, so our motor cars can secure fame and favour by the notice of the press. Journalists are the public educators, and in giving them an interest in automobilism agents in the provinces can do much to help forward the general progress.

Among the gentry automobilism is making great headway—as could be seen by the appearance of most of the people at the Automobile Club's provincial exhibitions. They recognise the social value of the motor-car in enabling them to visit distant friends and return during the same day, while enjoying all the healthy conditions secured by driving. The advantages of the motor-car for station work can be easily shown by agents offering to send vehicles to meet visitors and take them direct to their hosts from the station. A few such trial trips in many country districts would secure the motor-vehicle being made the subject of conversation in scores of places where likely customers were to be found, and trade should be much helped thereby.

So far as the fourth section of the community is concerned, its conversion will probably follow, and certainly not lead the other. A general invitation such as I urge with regard to persons in authority, professional people, and country families would be wasted on the main body of smaller commercial folk; but in every town there are scores of such people, who, by a solitary motor-car ride, might be tempted to indulge in occasional hirings for the day or for certain specified business runs. They should not be ignored, and every reasonable means adopted to secure their attention to the main advantages of automobiles.

Agents taking up the motor-car business in the provinces must be prepared to strike out new lines. If they are coach-builders they must not merely introduce the subject to old clients; and the same is even more true of cycle agents becoming interested in motoring. They must look at the matter from two points of view—the general advance of automobilism as well as their own individual prosperity. These two ideas can be combined for the advantage of the whole industry. Certainly the methods I have indicated appear more likely to achieve the result desired without loss of time, and far more efficiently than could be done by the indiscriminate circulation of pamphlets and leaflets. It directly appeals to the people by giving them a practical acquaintance with the automobile, thus revealing all the advantages in the most impressive way.

AUTOMOBILE RACING IN AMERICA.

IN our issue of May 4th last we gave the result of the 50-mile race promoted by the Automobile Club of America, from Springfield to Babylon and back. It will be remembered that the race was won by Mr. A. L. Riker, who drove an electrical vehicle. In connection with the race the following letter by Mr. Riker, sent to the *New York Automobile*, is not without interest:—

There have been so many erroneous statements made concerning the victory of my carriage in the recent fifty-mile road race that in order to do the electrical vehicle justice I consider it my duty to refute them by giving the facts in the case. The carriage that I drove in the competition has been called a racing machine, and I have been criticised for entering a speed contest with a fast vehicle. Again it has been stated that the batteries were ruined; also that I changed them en route, replacing the exhausted cells with fresh ones, and other such statements about as sensible. For sake of argument let us assume that they are true. There was no stipulation that the carriage should be slow, or that competitors

should not stop to replenish their power during the run. Therefore, such statements as the above are foolish, and can be dismissed without further comment; but before leaving them I will say that the batteries were not ruined, and that I did not change them; and further, after making the fifty-mile run with the same cells and without re-charging, I drove the carriage twenty miles further, making a total run of seventy miles, fifty of this being at almost twenty-five miles per

hour. This, you must remember, was made with a carriage whose weight was a little over 2,000 lbs. complete. Of this amount 960 lbs. were due to the battery, and I consider it a most remarkable performance for such weight of cells.

As a short description of the carriage may be of interest, the following are some of the principal features: The vehicle is of the piano box type of body, carried on a flexible running gear; two motors of three horse-power each are connected by spur gearing to the rear wheels, and steering is accomplished by swivelling the front wheel over the line of tread. These wheels are in turn connected to the steering bar, which resembles the handle-bar of a bicycle, by a system of levers. The wire wheels are 32-inch front, 36-inch rear, with 3-inch pneumatic tires pumped to 125 pounds per square inch. A controller with a number of speeds is operated by the central lever. A hand-brake which can be operated by either occupant, as well as the foot-brake, was found necessary to check the carriage.

The course, as will be remembered, was over the famous Merrick Road from Springfield to Babylon and return, making a course of fifty miles, all but twelve being over very good roads. The twelve mile stretch was miserable, being sandy and very heavy

from the fact that they were mending it, so that we had to slow down to about eighteen miles per hour while going through it.

As I started first, and turned the mark at Babylon in this same position in one hour and thirty-eight seconds, I was quite anxious to know whether I had gained or lost on the road out. As I started on the home stretch I met the other contestants coming out, and found that I had lost two minutes to Mr. Davis, but as the run out had been made before a twenty-mile an hour wind, and as we had been running less than half speed, I was not greatly worried as to the outcome unless I had some accident. Into the head wind we raced at about the same speed as on the journey out, but to accomplish this we had to develop fifty per cent. more power. The run back was made without incident in one hour and three minutes, having gained some twenty minutes over the second carriage. Within a couple of hundred yards of the finish I gave the carriage the full power and crossed the line at a speed of about forty-five miles per hour. And then what an ovation! Those who had scoffed at an electric carriage running fifty miles, let alone winning such a contest, were dumbfounded,

and changed their minds as to the chances of the electric against steam and petrol for a race of this distance.

In conclusion, I trust that there will be other opportunities offered to again try conclusions with steam and petrol against the electric carriage.

In less than a year Glasgow's second International Exhibition will be opened at Kelvingrove Park, and will cover an area of almost seventy acres, of which the buildings alone will occupy

about twenty. Apart from the permanent Art Gallery, there will be three main groups of buildings—the industrial section, the machinery annexe, and the grand concert hall—all connected together by means of bridges and avenues. The work of erecting the principal buildings was begun on the 22nd April, 1899, when the Lord Provost cut the first sod. Of the eight classes into which the exhibits are divided, the principal are: industrial design and manufactures; machinery, motive power, electricity, and labour-saving appliances in motion; locomotion and transport; marine engineering and shipbuilding. In each class representative and comprehensive exhibits are certain to be found, and those desirous of obtaining space should apply to the general manager, Mr. H. A. Hedley at once. Scientific congresses promise to be a feature of the exhibition, quite a number of scientific bodies, including the Institution of Mechanical Engineers and the Society of Engineers and Shipbuilders, having decided to hold their annual meetings in connection with it. Even twelve months before the official opening there are sufficient indications to justify the belief that the exhibition of 1901 will be a great attraction for all interested in art and industry.

SIR GOLDSWORTHY GURNEY'S STEAM COACH, WHICH RAN FOR SOME TIME, ABOUT 1830, BETWEEN LONDON AND BATH.

THE NEW MORS RACING CAR.

(From Our Paris Correspondent.)

THE accompanying photograph of M. Levegh's new Mors racing car is of special interest, as it depicts not only the first of the new series of *voitures de course* which has issued this season from the Grenelle factory, but it also illustrates what is assuredly the fastest French petrol car now on the road; and when one says the fastest French car, it is equivalent to saying the fastest car, for no performances have been made outside France which warrant one to believe that there are any speedier vehicles than those existent in this land of automobiles. Generally speaking, one does not expect to see the new types of French racing cars before May, but this year Mors have been very energetic, and the first of their new stud was finished in time for the Nice week, which took place at the end of April. Its initial performance was not a conspicuous success, for in the Nice-Marseilles race the mounts of René de Knyff, Hourgières, Charron, and Pinson all finished ahead of the Mors champion, which, however, had had the worst of luck in the matter of tire troubles. That this form was too bad to be true was conclusively proved four days later, when in the Nice-La Turbie race M. Levegh steered his car over the seventeen kilomètres of hill, most of it with a ten per cent. gradient, in 19min. 2sec., no less than 17sec. faster than the time made by any other competitor, and 6sec. faster than M. Lemaitre's record. The following day this victory was confirmed by M. Levegh's performances in the time trial he made over a kilomètre and a mile, the former distance being taken from a flying start. In both he was accorded a walk over as none of the other big cars competed. His times were—one kilomètre from a flying start, 48½sec.; one mile from stationary start, 1min. 32½sec. The only other occasion on which the vehicle has had an opportunity of showing its capabilities was the hill-climbing contest at Cannes, known as "L'Esterel," and here again it came in first of the cars. The time made for the 13 kilomètres 600 mètres was 14min. 41sec. an altogether exceptional performance when the severity of the grade and the sharp turnings of the course are considered. And what is the horse-power of the motor? one naturally asks. Well, I would just like, first of all, to point out a great change that has come over automobile constructors in the matter of quoting horse-powers. One or two years ago makers and owners alike exaggerated the actual power of their motors in about the same proportion as they now diminish it, and the reason for the change is this. Frenchmen became educated in the question of horse-power and received with an incredulous smile the constructor's assurance that the motor was of such and such a force. Accordingly the maker went on the other tack, and to-day he says, "See how my 12-h.p. motor beats those of 16-h.p. made by other firms." It is very confusing and misleading, but under existing circumstances what can be done. If a man likes to call his motor, which develops 30-h.p. on the brake, a 10-h.p. engine what is to prevent him? The car illustrated is known at the Grenelle factory as the

"1900 type," and this is, perhaps, the fairest way of designating a racing car. I have every reason to believe that the motor develops 31 to 32 h.p. on the brake. The car itself is entirely similar in appearance to the last year's type of Mors racer, and gives one the impression of being a veritable "flyer." The owner and driver is M. Velghe, a well-known member of the Automobile Club of France, who races under the name of Levegh, and who is undoubtedly one of the very few automobilists capable of driving such a car for all she is worth. It is probable that in addition to MM. Levegh and Antony, both of whom have achieved so many successes on Mors cars, M. Maurice Farman will this year be seen racing with a similarly powered vehicle of Grenelle construction.

ABOUT 200 automobile licences have been granted in Chicago, and the ordinance requiring them is being strictly enforced.

ONE of the biggest fires that has occurred in Reading for a long period took place on Thursday last week, when the premises of the Speedwell Electrical Motor Car and Cycle Company were destroyed. The outbreak occurred in the rear of the premises. The workshop is built of wood, and contained oil and other inflammable substances, and consequently the fire burnt rapidly.

The enamel vats quickly took fire, and despite the efforts of the brigade they were unable to prevent the fire from extending to the front of the premises. A few of the bicycles were got out, some in a more or less damaged condition, but over 100 machines were destroyed, including five motor-cars, three of which belonged to customers. The Speedwell Company have already opened temporary offices at the Queen's Hall, Valpy Street, Reading.

THE Century Motor-Vehicle Co., of Syracuse, N.Y., have lately constructed

an electric vehicle in which the method of power transmission is, for this class of vehicle, said to be something of an innovation. Instead of driving the rear axle by single-reduction spur gearing the motor is suspended from the forward part of the body, with its shaft in line with the carriage, but sloping downward and back in the direction of the rear axle. A spur pinion and gear connect the motor with a shaft running back to the rear axle and a bevel gear on the differential drum. The battery consists of forty two cells, arranged in six trays, and the connections to the controller allow of three speeds forward and three backward. The same method of transmission is also used in both the steam and the petrol vehicles built by this company. The steam motor is of the usual two-cylinder type, reversible and double-acting, and it is suspended from the body on pivotal bearings on a similar plan to the electric motor, with the engine shaft coupled direct to the gear shaft which drives the rear axle. The driving mechanism and engine are entirely enclosed and dust-proof. The petrol vehicles have the engine arranged inside the rear of the body, and the change speed gear is pivoted to the body, transmitting the power to the rear axle by means of a gear shaft and bevel gears, similar to that used in the other two styles of vehicles. The frame of all the vehicles is constructed of seamless steel tubing, and is made flexible to allow for inequalities in the road. All the vehicles are steered and the speed controlled by means of one lever.

THE NEW MORS RACING CAR.

WHITSUNTIDE JOTTINGS.

THE first two days of the Whitsuntide tour were marred by the weather. So persistent was the rain, so boisterous the wind, and so mud-adorned were the streets of London, that comparatively few vehicles turned up at the start in Horse Guards Avenue. Personally, I heaved a heavy sigh of regret, unpacked my bag, and decided to wait and see what the morrow would bring forth. But for once the Fates were kind. About one o'clock Mr. Rolls most kindly called round and asked if I would go with him on his flying 12-h.p. Panhard of 1,000-mile fame. I jumped at the offer, sending our boy on in advance with the quadricycle we proposed driving throughout the tour. At ten minutes to two Mr. Rolls left London, steering the car splendidly through the greasy streets, and with a master in the art of motoring at the helm, even the fear of sideslip soon vanished. Such a consummate driver inspires his passengers with absolute confidence, even when travelling at a rate of something over 40 miles an hour. The car herself was a revelation—so smooth, so steady, so speedy, and vibrationless. She romped up the steepest hills in a fashion which made one positively scornful of gradients, apt to inspire apprehension on an ordinary vehicle. But, alas! the puncture fiend pursued us, and twice were we brought to a standstill, owing to cruel nails over an inch in length. Then a terrible jolt necessitated a repair to the brake rod. Off with his mackintosh, on with his boiler suit, and in a second Mr. Rolls was lying flat on his back under the car, his head reposing gracefully in the mud. At this juncture a dear old white-haired dame came tottering by. For a few seconds she eyed the prostrate motorist with undisguised concern, then, unable to restrain her sympathy, she turned to me. "Dear, oh, dear!" she said, "is that poor thing lying crushed there beneath the wheels?" I tried to calm her by the assurance that the "poor thing" was not quite in the plight she imagined, and murmured something about brake repairs. But she was not content, and shaking her hoary head asked with kind solicitude if a cup of tea would be of any service. It was difficult to see the connection between the tea and the brake, but we were much touched by her offer. The rural population seem everywhere kindly disposed towards motoring. Steady rain and furious wind accompanied us both to and from Peterborough. But if the elements were unkind, the exceeding beauty of the country did much to atone. Nature had showered golden buttercups over the fields with a prodigal hand. The may was abloom and scented the air with its fragrance. The delicate lilac clustered in bunches round the cottage doors, and the yellow laburnum hung its tasselled head with gorgeous liberality. Even a patch of common rhubarb had caught the spirit of beauty everywhere apparent, and thrust up great seedy spikelets. And when, towards noon, the sun forced its way through a sickly sky, and illuminated the wide, luxuriant country with pale rays, the motorist could not but feel rewarded for his courage in having ventured forth from London under such unfavourable conditions. And lo! on the following day, as if ashamed of his lack of generosity, Phœbus shone out resplendently, and shed both warmth and sunshine on the land. How beautiful it was, bowling along the leafy lanes, every common ablaze with gorse, and the may emitting its sweet, pure fragrance! Absurd to say the motorist cares only for the drum, drum, drum of his engine and is deaf and blind to pleasing sounds and sights. They intensify his enjoyment a thousand fold. We drove the good quadricycle along at a steady pace, and did not neglect levers or advance ignition, but at the same time we had eyes wherewith to admire Mother Nature in a rarely genial mood. And so ended a very happy day. If any of my own sex contemplate the purchase of a quadricycle or tricycle, and are trembling in the balance, I can recommend either from personal experience. Mrs. Clarke, of Norwich, proved how graceful a lady can look upon the latter, and with what ease it may be manipulated. A good Ariel or De Dion will give the purchaser many happy moments, and they have the advantage of being less expensive than a car, and more economical as regards petrol. Moreover, their speed is undeniable. A divided skirt gets over the difficulty of a diamond frame and if properly made, is

almost precisely similar to an ordinary one. Many ladies, who find cycling fatiguing, will derive infinite pleasure from either a quadricycle or tricycle. A distinguishing mark of the automobile tours is the spirit of satisfaction which prevails amongst its members. They are as a bird of brothers inspired by a common enthusiasm. And yet the general public still stand aloof, and view the pastime with suspicion. Foolish public! They little know what they lose.

MARY G. KENNARD.

THE WILFORD PETROLEUM-SPIRIT MOTOR-VOITURETTE.

WE are now able to give an illustration of the petroleum-spirit motor-voiturette exhibited at the recent show in Brussels by Messrs. C. L. Wilford and Fils, Ingénieurs-Constructeurs, of Tamise, near Antwerp, Belgium. The car, which has seating accommodation for three persons, is propelled by means of a vertical engine located in the fore part of the frame. The motor, which is of 3 h.p., is provided with electric ignition and a water-jacketed cylinder. Belt driving is adopted, there being two speeds—10 and 35 kilometres per hour—available. The body of the car is well suspended, it being carried by plate springs at the front and C-springs at the rear, the road

wheels being of the cycle type shod with pneumatic tires. Steering is controlled by an inclined hand wheel, while there are three brakes available—one on the differential shaft and one on each of the hubs of the rear wheels. The car complete weighs 240 kilogrammes or 4½ cwt.

THE Manchester Automobile Club is arranging another run for its members for Saturday, the 23rd inst.

THE next quarterly 100-mile and hill climbing trial of the Automobile Club is fixed for Wednesday, the 27th inst. Entries will be received up to the 20th inst.

THE 60-mile run of the members of the Liverpool Self-Propelled Traffic Association takes place to-day (Saturday). The route was given in our issue of the 26th ult.

OUR Paris correspondent last week referred at length to a sale by auction of motor-cars which was recently held in Paris. The example thus set is now to be followed in this country, for we learn that Mr. Ernest Owers, auctioneer, of West Hampstead will hold a sale by auction of several motor-cars and tricycles during the course of the present month.

AT a meeting of the Pontefract Rural Council, on Saturday last, a complaint was made against the fast rate of speed at which motor-cars ran along the roads. One up-to-date member said the party who were engaged in the recent 1,000-mile Trial dashed along the roads, while another alleged the people could not see themselves for steam! He thought motor-cars ought to have a signalman in front like traction engines, which were not nearly so dangerous. It was decided to ask the County Council to seek legislation in the matter for the better protection of the public.

MOTOR-CARS ON THE CONTINENT.

—8—

A
Heavy
Sentence.

ONE of the severest sentences yet passed upon a *chauffeur* since the commencement of the war was delivered by the judges of the Tenth Correctional Court of Paris on Thursday, the 31st ultimo, and although he would appear to be somewhat blameworthy in the matter it is open to doubt whether the unfortunate recipient entirely merited the harsh punishment accorded to him. From the evidence given it would appear that the accused man, Gedda, who, by the bye, is one of the Phébus foremen, was riding a motor-cycle down the Avenue Marceau at a speed of fully 40 kilometres per hour and had perched up behind him a fellow workman. This latter, no doubt, hampered Gedda's movements somewhat, for, in endeavouring to pass between a carriage travelling in the opposite direction and an open drain, he collided with the former and more or less injured the occupant, a certain Madame Gilbert. This lady promptly commenced the legal proceedings which have now terminated so unhappily for Gedda; indeed, she was in court on the 31st ultimo, and apparently in good health. It took the judges but a very few minutes' deliberation to decide that Gedda was to blame, and they then condemned him to two months' imprisonment, £4 fine, and £80 damages, at the same

skillfully executed by this innocent-looking little machine! I do not deny that a run on a motor-bicycle over country roads is a delightful experience, but if one has to descend and push a seventy or eighty-pound machine through the more crowded streets of every town encountered *en route*, I for one do not think that it is good enough, and would prefer to pay another £40 and buy a tricycle. Such as it is, however, some progress has been made in the machine's construction, and the motor-bicycle of to-day is a long way ahead of that in use a couple of years ago. Not one of the least important factors in this improvement has been the annual race organised by *Le Vélo* expressly for this class of automobile, and in the regulations of which the limit of the competing machines' weight has been yearly cut down, so obliging those manufacturers desirous of being represented to devise all manner of ways and means to economise weight. In 1898, Osmont, riding a machine weighing no less than 80 kilogrammes, covered the hundred kilometres of route in 2 h. 29 min. 37½ sec., while a year later G. Labitte made the same distance in 2 h. 38 min. 56 sec., but on a bicycle weighing only 43 kilos. 600. This year the promoters reduced the weight to 40 kilogrammes, and as the *course* comprised three turns instead of one, as formerly, the performances of the leading men were of exceptional merit. The *course* attracted a total entry of seventeen competitors, and these presented themselves at the *pesage* before the race. The weights recorded were as follows:—1, Bonnard

A MOTOR-CAR MEET AT SOUTHPORT (see page 247).

time-declaring that the Phébus Company was civilly responsible for the accident. This is dreadfully out of proportion to the merits of the case. But then it is the war!

The "Velo's"
Motor-bicycle
Race.

THE third and last of the three races organised annually over the Etampes-Chartres road by *Le Vélo*, and known as "Les Trois Critériums," took place on Thursday, May 31st, in fine but very windy weather. A fair number of people assembled at Etampes to witness the race, but not the crowd one sees when cars, voiturettes, or motor-tricycles are competing, for in France the motor-bicycle, comparatively speaking, commands but little attention either from a racing or touring point of view. Here in Paris, where one sees daily some hundreds of automobiles, it is quite an event when a motor-bicycle passes, unless, of course, one is in the immediate vicinity of a firm manufacturing or trading in this class of machine. If people interested in their sale are to be believed, there are thousands of motor-bicycles ridden regularly in France, but these machines must be very rurally disposed, for one sees them seldom in inhabited spots. Personally, I am not surprised at this condition of things, which I account for rather by the timidity of the rider than the bashful modesty of the machine. But perhaps I should not say timidity, for it requires more than an ordinary stock of courage to ride a motor-bicycle through crowded streets after a shower of rain. Oh! those side slips, so cunningly conceived and

38 kilos. 500; 2, Cousin, 38 kilos. 500; 3, Rémy, 39 kilos.; 4, Garreau, 37 kilos.; 5, Rivierre, 38 kilos. 500; 6, Lesaint, 33 kilos.; 7, Léonard, 38 kilos. 500; 8, Léa Lemoine, 38 kilos. 500; 9, G. Labitte, 38 kilos. 500; 10, Arnault, 31 kilos. 900; 12, Eugène Buquet, 39 kilos.; 13, Auguste Buquet, 38 kilos.; 14, Robin, 38 kilos.; 15, Durey, 39 kilos.; 16, Fournier, 38 kilos.; 17, Quitte, 32 kilos. 500. Unfortunately neither Mlle. Léa Lemoine, M. Arnault, nor M. Quitte were able to actually participate in the race, the former by reason of the accumulators of her machine having run out, and the other two on account of their being unprovided with the necessary *permis de conduire*. The fourteen other competitors were duly despatched at one-minute intervals, some pushing, while others pedalled their cycles until the motor commenced to work. Upon the completion of the first outward run of 25 kilometres to Ablis, Cousin was holding a three minute lead from Bonnard, Rivierre lying third, the last named being the famous long-distance rider of the ordinary bicycle, whose name was a household word in the cycling world some few years ago. The termination of the first half of the journey witnessed Cousin leading the way, followed by Rivierre and A. Buquet, their respective times for the 50 kilometres being 64min. 52½sec., 65min. 24sec., and 65min. 50sec.—excellent going, especially when the strong wind is taken into account. Shortly after this point both Rivierre and Cousin experienced driving-belt troubles, and at the end of the second outward journey Bonnard had secured the lead, Cousin being second, and Rivierre only

sixth. During the last twenty-five kilomètres Bonnard maintained his lead, but upon the classification being made it was ascertained that he took but second place, the actual winner being found in A. Buquet. The official return was as follows:—1, A. Buquet, in 2h. 17min. 11sec.; 2, Bonnard, in 2h. 18min. 38½sec.; 3, Cousin, in 2h. 21min. 19sec.; 4, Léonard, in 2h. 22min. 3sec.; 5, Garreau, in 2h. 33min. 51½sec.; 6, Rivierre, in 2h. 54min. 44sec.; 7, Lesaint, in 2h. 55min. 3sec.; 8, E. Buquet, in 3h. 19min. For one cause or another G. Labitte, Rémy, Robin, Durey, and Fournier were compelled to abandon. The winner's average per hour was forty-four kilomètres, or, say, twenty-seven and a half miles per hour, and he rode a Lamaudière and Labre machine, which carries its motor at the bottom of the frame and drives on to the back wheel. It is certainly good travelling, and would undoubtedly have been better but for the wind, which hampered the competitors throughout the race.

Taxation of Automobiles.

THE troubles of the automobilist would appear to be on the increase, for, not satisfied with persecuting them and their vehicles in the matter of police regulations it appears that the Government have the idea of adding to the treasury by increasing the tax upon self-propelled vehicles. At any rate, in the proposed Budget of the Minister of Finance a proposition is made whereby a sliding scale of taxes following the horse-power of the motors will be adopted, and if M. Caillaux's suggestion is authorised by the Government some of our racing friends with their 30-h.p. engines may expect to pay pretty heavily for their mounts. I do not see any great objection to the proposal, for those men who own high-powered cars can well afford to pay any tax that may be levied, so that the adoption of the Minister's suggestion is not likely to have any disturbing influence upon the industry.

A Level Crossing Accident.

THE dangers of the railway level crossing were again manifested on the evening of May 30th at Bar-sur-Aube, where an accident occurred which might well have had a fatal issue. It appears that upon arriving at this level crossing a certain M. Tissot, who with a mechanic was mounted upon a voiturette, found the gate closed to permit of the passage of a train. Becoming somewhat impatient at the delay M. Tissot appealed to the railway official in charge, and this latter threw open the gates for him to pass, without remarking the near approach of a train. The car and its occupants had not quite got clear of the line when they were struck by the locomotive and overturned violently. But even in the case of M. Tissot and his companion the now well-known saying, "*Il y a un Dieu pour les chauffeurs*," held good, and whereas the voiturette was completely smashed the occupants escaped with but a few bruises. But they will take precautions in future when passing over level crossings, and not trust too implicitly upon the guardian.

Public-Service Vehicles Wanted in Germany.

A PROPOSAL to establish a motor-car service between Riegelsburg and St. Johann-Saarbrücken, Germany, a distance of about 5½ miles, has for some time been receiving the consideration of the municipal authorities of the former place. At last they have decided to give the scheme a trial, and are calling for offers for the supply of two eight-seated cars for a period of six months. Should the service prove successful the authorities will either retain the cars or order larger vehicles, but if a failure will return them to the makers. Offers are to be sent to Herr Burgermeister Speicher, Riegelsburg, near Saarbrücken, from whom full particulars of the projected service can be obtained.

AUTOMOBILES, chiefly steam-driven, are, it is stated, now being largely used between home and office by a number of New York business men.

CORRESPONDENCE.

THE FIRST MOTOR-CAR COMPETITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the 1,000-mile Trial has been brought to a successful close, it may be interesting to know something about the first automobile competition ever organised. This was promoted by the *Petit Journal*, and took place on 22nd July, 1894, on the Paris-Rouen road. The first notice of the trials was issued on 19th December, 1893, the programme being as follows: "International competition; mechanical propulsion of any system; cars of any shape; number of seats *ad libitum*, with a minimum of two seats; cars to be safe, well under control, and not to cost too much when running. Preliminary trials over a distance of 30 miles, average speed 8 miles an hour, any higher speed not being taken into consideration; final trial on the Paris-Rouen road, a distance of about 73 miles. Entries accepted from 29th December, 1893, to 3rd April, 1894. Manufacturers and inventors only are allowed to compete." The staff of the *Petit Journal* acted as judges, aided by a few engineers as advisers. There were five prizes offered of respectively £200, £80, £60, £40, and £20. The number of entries amounted to the remarkable total of 102. When the time for the trials arrived, however, only 47 cars turned up.

The first day of the trials twenty-three cars entered, and seventeen took part in the run; twenty-one cars were admitted to the final run; fifteen went through all the tests successfully. This was very satisfactory, considering that it was the first competition of the kind. The following is a list of fourteen cars in their order of arrival at Rouen; they left Paris at 8 a.m.

Number of Car.	—	Number of Seats.	System.	Time of Arrival at Rouen.
				P. M.
4	De Dion-Bouton	4*	Steam	5.40
65	Peugeot	4	Petrol	5.45
28	Peugeot	4	"	5.50
13	Panhard and Levassor	4	"	6.30
31	Peugeot	5	"	6.7
42	Le Brun	4	"	6.24
15	Panhard and Levassor	2	"	6.30
64	Panhard and Levassor	4	"	7.1
30	Peugeot	3	"	7.2
24	Vacheron	2	Gasoline	7.3
27	Peugeot	2	"	7.5
14	Panhard and Levassor	4	Petrol	7.10
85	Roger	4	"	8.9
60	Le Blant	8	Steam	8.50

* This car being only a tractor carries only two seats, but can pull anything from a cab to an omnibus, according to its size.

Appended is a brief description of some of the cars:—Nos. 13 and 64, Panhard cars, did the 73 miles in less than 11 hours; they were fitted with two-cylinder Daimler motors; the engines were of 2½ and 3½ h.p. respectively; capacity of water tank 8 gallons, amount of water evaporated per hour ranged from 10½ to 15 pints; petrol was ¼ pint per mile.

No. 4, De Dion steam tractor, fitted with a 20 h.p. compound engine, but high-pressure steam could be used in both cylinders if necessary; weight in full working order about 2 tons; it could haul a load of 1 ton at a speed of 17 miles an hour, or on grades of 8 to 10 per cent. at about half the speed. More powerful tractors were built to haul loads of 8 to 9 tons at 4½ miles an hour.

No. 60, Le Blant steam brake; steam was generated in a Serpollet flash boiler; 12 pints of water and 6 lbs. of coke were consumed per mile.

No. 24, Vacheron car, petrol. This car was on the same principle as the Panhard, but was fitted with wheel steering, being in this respect in advance of the Panhard cars at the time.

No. 85, Roger car, fitted with 3 h.p. Benz motor, electric ignition, speed up to 17 miles an hour, could run up grades of 10 per cent. at a moderate speed; weight, 11½ cwt.

No. 10, Scotte steam brake, Field boiler, 5 h.p. engine

running at 300 to 500 revolutions per minute, feed water was heated to 30 deg. C. before entering boiler, total weight with passengers 2 tons 8 cwt., consumption of water per mile 10 to 13 pints according to the road, 3 to 5 lbs. of coke being used for the same distance. An accident to a boiler tube near Vernon stopped the car from continuing the trial.

No. 61. Steam car, M. Roger de Montais. The boiler measured 17 by 17 in., had twenty-six copper tubes, and was heated by twenty-six petrol burners, the regulation of the fuel was automatic, the consumption of petrol 3 pints per hour, 45 pints of water being evaporated per hour. The water tank held sufficient water for a run of 2 hours. The two cylinders were $2\frac{1}{2}$ by $3\frac{1}{4}$ in., speed up to about 13 miles an hour; the car could mount grades of 13 per cent. at 4 miles an hour. This car was the work of an amateur, and is rather interesting.

No. 18. Steam omnibus. This car, which had a Serpollet boiler placed at the rear, although fairly well designed for the work it was to do, did not quite answer to the conditions of the programme.

The last two cars arrived late at Rouen through some mishap.

London, June 2nd.

Yours truly,

L. CHEFDEVILLE.

THE AUTOMOBILE CLUB 1,000-MILE TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I trust that you will permit me, through the medium of your columns, to publicly express the thanks of the committee of this Club, and of those who participated in the recent 1,000-mile Trial, to the officers of the county and borough police forces for the arrangements made by them to facilitate the Trial; to the men of those forces for the assistance they rendered in directing the drivers of motor-vehicles; to the county and borough surveyors for their ready response to the suggestion that new stones should not be laid over the whole of the width of the roads over which the Trial vehicles were to pass; to the gentlemen who acted as honorary timekeepers and who assisted by erecting flags of direction; to the local committees who guaranteed the expenses of and provided exhibition buildings, and carried out other local arrangements; and to the public generally for the support given to the Club in their undertaking.

The object of the Trial was to endeavour to improve the position of the automobile industry in this country, the opinion of the committee of the Club (which has no commercial connection with the industry) being that this country should not be behindhand in an industry in which many thousands of men are at the present time employed in France at high wages, and which has there and elsewhere assumed very considerable proportions.

The Club has highly appreciated the assistance received from the Press in their endeavours to further the movement.

Yours truly,

ROGER W. WALLACE,

Chairman of the Club Committee.

Automobile Club of Great Britain and Ireland,

June 1st, 1900.

CHANGE SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in the paper by Sir David Salomons that mention is made of what would be a satisfactory change-speed gear, viz., mounting each speed ring on a clutch so that the wheels could always be in mesh and connected up with the axle when required. The chief objection, however, appears to be room. Is there not a contrivance of this sort in the De Dion voiturette? Personally I have never looked into the gear of this car, and should be glad for information. I believe in Iden's Princess car the gear wheels are always in mesh, but I am not sure how the engagement with the axle is effected. Anyhow, I believe it is satisfactorily effected. Hoping that some reader will enlighten me on these points.

Yours truly,

R. A. COBB.

2, The College, Malvern, June 3rd, 1900.

THE PROPOSED MOTOR TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one interested in the development of the automobile for practical service I was sorry to see the suggestion made for a track whereon races for motor-cars were to be instituted. From the time this is done the decadence of the industry may commence. At present the tours organised by the Automobile Club and the races arranged at the Crystal Palace from time to time supply all that is necessary in this way, and we do not want the sportive element too closely identified with automobilism. The professional element in racing would assuredly creep in, and, in addition to the prejudice against companies which the public now seems to entertain, the antipathy to professionalism in sport would also have to be encountered. Therefore, I trust, nothing more will be heard of the idea.

Yours truly,

Plymouth, June 5th, 1900.

A CAUTIOUS SCOT.

SIR,—Whether the proposed motor track would do much to popularise the motor-car is a matter that only time and experience can prove, but it could do no harm. That it would give pleasure to thousands is almost certain, judging from the interest taken in the recent tour of the Automobile Club.

Could not the project be made a subject for discussion at the Automobile Club next winter, with a view to eliciting the opinions of all sections of motorists in the suggestion? Such a track would not only give the public a new excitement and increased facilities for the enjoyment of the pastime, but would furnish manufacturers with a splendid means of testing their vehicles before putting them on the market.

Yours, etc.,

Ipswich, June 2nd, 1900.

H. F. W.

A 12 H.P. DAIMLER CAR.

THE directors of the Banchory and Strachan Autocar Company, Limited, expect to inaugurate a service to Birse and Finzean on the 11th inst. The cars are to be run in connection with the morning trains at Banchory Station.

A FEW days ago a new light motor-car, built at the works of the Adler Fahrradwerke Gesellschaft, at Frankfort-am-Main, Germany, was taken out for a trial trip with, it is stated, successful results. The car is fitted with a 3 h.p. water-cooled motor and weighs about 7 cwt.

IN connection with Sir David Salomons' reference to variable-speed gears in the course of his paper read before the Anglo-French Association recently, the S. S. Motor Co., of 59, Holborn Viaduct, London, E.C., write to say that in the S. S. car there are three speeds forward and one reverse, each of which has its own set of cog-wheels always in mesh, mounted over a friction clutch. These friction clutches are controlled by a rack and pinion, and the levers so controlling them are small, and mounted beneath the steering wheel. They will be pleased to show the car at any time by appointment.

HORSE-POWER TESTS OF MOTOR-CARS.

—8—

SOME attention was given in a previous article to the testing of small petroleum-spirit motors. The results arrived at by these tests are of value mostly between manufacturers of motors and manufacturers of vehicles. It enables them to decide what size of motor to build and install in a carriage to obtain certain results. However, after the motor is built and installed, when the whole has become one machine and it is desired to give a prospective purchaser some idea as to the capacity and economy of the vehicle, it is of little value to state the horse-power of the motor, as this conveys to him no idea as to what the carriage will do on the road—in fact, very few who are not engineers have any idea as to the meaning of the term "horse-power." There should consequently be at hand information concerning the motor-carriage in terms which are intelligible to such a person—information expressed in miles per hour under certain conditions, maximum hill-climbing capacity and fuel consumption per mile, under given conditions of road and grade. Although the speed and climbing capacity of the carriage depend primarily on the brake horse-power of the motor, yet with carriages of varying design it is possible that the same brake horse-power may produce varying results. The transmission or the running gear of the vehicle may absorb more power in one case than in another, leaving less power available for propelling purposes, which fact may materially alter the road capacity and economy of the machine. To obtain results, therefore, which shall be of value to the manufacturer and user of vehicles, information is required concerning the performance of the carriage on the road.

Results of tests of this kind, to be of value, should be comparative—that is, a method of testing should be adopted which would permit of the results from one carriage being compared with the results from another. Actual road tests, however, are acknowledged to be unsatisfactory for this purpose, because the conditions of the road, wind, and weather cannot be controlled, and are different for each trial conducted, regardless of the care which may be taken in conducting the trials. In the following discussion a method of conducting such trials will be considered, by means of which all the conditions of road, grade, wind, and weather may be kept constant for any number of trials, and the results from which will be comparable with absolutely no modifications or corrections. Although a similar method has not been used for testing automobiles, a modification is being used at the present

time for testing locomotives, three or four plants being equipped for that purpose in America; and very valuable results have been obtained therefrom. Similar apparatus has been used successfully for testing tricycles, and it is fair to suppose that it would prove even more successful for trials of horseless carriages.

The apparatus necessary, which will be explained in detail, while not expensive, would be of value more to manufacturers or persons having a number of vehicles to test, and especially valuable in comparative trials of various makes of vehicles. The apparatus or machine shown in Figs. 1 and 2 consists in the main of a shaft of suitable length mounted in bearings and carrying at its centre a brake wheel *A*, and on each end a supporting wheel *B*. The vehicle is placed with its front wheels resting on a platform, the height of which is equal to that of the top of the

supporting wheels, and with its driving wheels resting on the supporting wheels, the centres of the driving and supporting wheels being in line vertically. The carriage is held in this position by means of an iron brace attached to the rear axle and connected to some support in the rear of the carriage. This brace allows a vertical motion of the carriage in order that it may rest with the full weight on the driving wheels, but does not permit transverse or longitudinal motion to take place.

It is evident now that if the motor is started the carriage cannot move forward; consequently the supporting wheels will revolve backward, with a peripheral speed exactly equal to the forward motion of the carriage were it on the road. If we apply a brake to this shaft the backward motion of the supporting wheel will be retarded, and a load will be thrown on the motor in proportion to the resistance. Let us follow out the construction of the machine, and ascertain how nearly we may arrive at road conditions, and how nearly

we may maintain these conditions. The resistance which a carriage meets on the road may be classified as follows: the friction of the transmission gear, the friction due to the condition of the road, the resistance of grades, and the resistance of the wind or air. The first two are always positive, the last two may be negative, zero, or positive. In regard to the friction of the transmission gear, it is evident that all parts are in motion except the front wheels, and the friction in these wheels may be replaced by the friction of the shaft supporting the rear wheels. Although there is a greater weight on these wheels than on the front wheels, if the bearings are nicely made the difference in friction will be slight, and may be neglected without appreciable error.

The kind and condition of the road may be reproduced by constructing the supporting wheels as shown in Fig. 4. This

FIGS. 1 AND 2.—PLAN AND ELEVATION OF TESTING APPARATUS.

wheel may be a standard pulley of light construction provided with a false removable rim of sheet steel attached to the pulley rim by short cap screws, and on which a layer of material may be attached to represent a given kind or quality of road. Supposing that we desire to represent an asphalt pavement, we would build into this rim a layer of the actual pavement, anchoring it by such means as may be found necessary, and finishing the surface as is done in practice. With this construction there should be the same action between the driving wheel and the supporting wheel as will occur in actual travel over this pavement. This rim may be constructed to represent block pavement, turnpike or any other form of standard road of any degree of smoothness or roughness desired by arranging the coating to correspond.

The size of these pulleys should be such that a given number of revolutions would represent a mile travelled by the carriage. For instance, if the outer coating were 38 3/16 in. in diameter, one revolution would represent 10 ft., and 528 revolutions would be one mile travelled.

In climbing a grade the motor must overcome the road friction of the carriage, and in addition do the work of raising the weight of the carriage through a given height in a given time, depending on the degree of steepness of the grade. This work is manifest in a back pull on the carriage in the direction of motion equal to the component of the weight of the carriage down the grade, which resistance is overcome through a distance equal to the length of the grade.

The amount of this back pull of the force necessary, to sustain the carriage on the incline may be computed as follows (see Fig. 4):—

Let W be the weight of the carriage.

Let L be the base of the grade.

Let H be the height of the grade.

Let P be the pressure to sustain the weight or the component of the weight down the grade.

Then

$$P = W \sin a \text{ or } W \frac{H}{L^2 + H^2} = W \frac{H}{\sqrt{L^2 + H^2}}$$

Now, if L be taken such that $H = 1$, or, in other words, if the grade be 1 ft. in L ft., or 1 in L , we have

$$P = \frac{W}{\sqrt{L^2 + 1}}$$

For grades varying from 1 in 5 in 100 this component is given in the following table for each 100 lbs. weight, or when $W = 100$.

Grade.	P in Pounds.	Grade.	P in Pounds.	Grade.	P in Pounds.
1 in 5	19.61	1 in 30	3.33	1 in 60	1.67
1 in 10	9.95	1 in 35	2.85	1 in 70	1.43
1 in 15	6.95	1 in 40	2.50	1 in 80	1.25
1 in 20	4.99	1 in 45	2.22	1 in 90	1.11
1 in 25	4.00	1 in 50	2.00	1 in 100	1.00
		1 in 55	1.82		

If then we wish to ascertain the performance of the vehicle on grades we must apply a resistance at the point of contact of the driving and supporting wheels of such an amount as will represent the desired grade. This is accomplished by means of a friction wheel and brake attached to the supporting shaft. A convenient brake for this purpose is shown in Fig. 3. It is

easily adjusted, very sensitive and smooth running, and is capable of absorbing the power of any vehicle which it may be desired to test. The brake wheel is cast with two flanges projecting outward to act as a guide for the brake, and two others extending inward to form a trough for cooling the water.

The brake is made of maple or other close-grained hard wood, the friction pieces are made of material 1/2 in. thick, with a 1/4 in. space between each piece, as shown in the sketch, and the rubbing surfaces are finished to fit the wheel nicely. The two screws A and B are for adjusting the brake to the wheel to obtain the proper pressure, and the third screw C is for making fine adjustments while running. A counterweight may be placed on the opposite end of the arm, of sufficient weight to balance the brake when resting on a knife edge placed directly over the centre of the brake wheel. The reading of the scale will indicate the net load on the brake; otherwise it would be necessary to correct the scale reading for the weight of the arm.

If the brake arm be of a length equal to the radius of the supporting wheel, the reading of the scale will be the retarding force applied; but this arm would be too short, and it would probably be more satisfactory to have the arm twice the length or equal to the diameter of the supporting wheel, and to multiply the scale reading by two to obtain the retarding force. To illustrate, suppose we desire to represent a grade of 1 in 15 with

a carriage weighing 700 lbs. From the table the resistance due to grade for that inclination is 6.55 lbs. per 100 lbs. weight, which would amount to 46 1/2 lbs. total resistance. If now we tighten the brake until the scale shows a reading of 23 1/2 lbs. we will have a tractive effort of 46 1/2 lbs. between the driving and supporting wheels, and the carriage will be doing work equivalent to propelling itself up a grade of 1 in 15. Any grade may be thus produced, and the limiting grade for the vehicle will be found by tightening

the brake until the motor is just able to carry the load. Take the reading of the scale and divide by the weight of the carriage, multiply by 100, and find the corresponding number in the table in the column marked P . Opposite it will be found the grade.

We have yet to represent the wind resistance of the vehicle, which, we have said, may be negative, zero, or positive, and which may strike the vehicle at any angle, according to the relative courses of the wind and carriage. These facts make it exceedingly hard to take account of this resistance; but if we may be able to obtain constant conditions for two tests much will be accomplished over that which is possible on the road, and it would probably be simplest to consider this resistance zero. It is evident that for the same type of vehicle it would be practically the same for like speeds, and the results from these tests would be comparable. At low speeds the wind resistance is negligible in any case. Amounting at four miles per hour to a pressure of but .08 lb. per square foot against a plane, at fifteen miles per hour this pressure is 1.125 lb. per square foot. This would probably be increased in vehicles, owing to the irregular form of the surface exposed, and these results might be doubled.

If considered necessary, however, to ascertain positively the retardation due to wind, it could be accomplished without any great trouble in the following manner:—A level platform should be provided on which the vehicle could be placed and revolved so as to always face the wind, and fastened in position longitudinally.

FIG. 3.

FIG. 4.

dinally by means of a cord with a spring balance interposed. Now, if simultaneous readings be taken of the spring balance and an anemometer, we will have a series of results showing the back pull due to the wind resistance for all the velocities which may have been recorded. Since the wind is liable to be variable, our readings will cover the necessary ground, and these resistances may be represented by adding to the friction load of the brake the necessary amount. This might also be done more accurately, but at greater expense and trouble, by constructing a duct from a large centrifugal ventilating fan of sufficient size to admit a vehicle, there fastening it in the same manner as before, and forcing air past it by means of the fan, the pull being indicated by the balance. The velocity could then be maintained constant for any length of time and more accurate results obtained. This method has already been used with success in studying the wind resistance of trains.

We have now been able to represent all the most important conditions existing on the road in a manner which would make the tests reliable, and in a manner which could be copied any number of times with security. For the trial of a vehicle a course could be laid out to represent as nearly as possible an actual trip of, say, twenty miles, consisting of a given kind or quality of road and certain distances having given grades, etc. The vehicle should be weighed and the proper brake reading computed for these grades and conditions. The load could then be varied at the proper time by noting the distance travelled, as

FIG. 5.

indicated by a cyclometer attached to the supporting wheel. In conducting tests the carriage tank (in case of petrol and steam vehicles) should be replaced by a graduated tank, from which the petrol used is drawn, and which would afford a means of measuring the amount used. Readings should be taken at frequent intervals throughout the test of the height of the petrol level and the distance travelled, and a description added of the conditions under which the carriage has been running for the preceding period.

Also in computing the brake load for any condition of grade the weight of the passengers should be included in the gross weight carried up the incline, and passengers or weights to represent them should occupy the seat or seats of the vehicle under test. — BY E. C. OLIVER IN THE *Horseless Age*.

It is stated that a number of steam road engines on the Scotte system, as well as a number of automobiles, will take part in the manoeuvres in the east of France this year. The General Staff propose to experiment with automobiles on a large scale.

MR. F. S. PUSEY, of the General Electric Automobile Company, recently made a run from Philadelphia to Atlantic City, a distance of sixty miles, in an electric automobile on one charge of the battery. The battery used is said to be of the standard type, not a special one.

CLOTHING FOR AUTOMOBILISTS.

IF proof were wanted of the progress that is being made with the automobile movement it is to be found in the increased attention which is being paid to it by other branches in the way of providing necessary accessories. Particularly is this noticeable in the tailoring trade, in which quite a number of concerns have already laid themselves out to meet the requirements of automobilists. Prominent among these are Messrs. Holding and Son, of 7, Maddox Street, London, W., in whose establishment we had an opportunity the other day of inspecting several of their latest productions for *chauffeurs*. Messrs. Holding do not confine their attention to any one special article, but are turning out coats with either leather on the inside or the outside, and even with leather as an intermediary lining. Furthermore they are making long and short coats, coats for lady and gentlemen automobilists, while they are also turning out special coats and suits suitable for drivers and servants. Having briefly outlined the scope of Messrs. Holding's productions, we may refer to a few of the articles of apparel we were able to examine. First came a long brown coat lined with thin leather, over which was a second lining of a check pattern woollen material, a coat which appears to be not only wind and water proof but in which special attention has been paid to the method of ventilation. Another attractive coat we were shown was made of a special West of England grey melton, of sufficient length to fully protect the knees. The coat is leather lined and provided with a good high collar fitted with double tabs. This coat has no visible buttons, and is fitted with wind tabs to the ends of the sleeves. In the way of leather coats, Messrs. Holding can furnish them of genuine kid or mock kid, both wool lined. We were shown a short light brown genuine kid leather coat that had been made for a lady and were struck with both its softness and lightness.

As already mentioned, Messrs. Holding also devote attention to the sartorial wants of drivers and servants, and for these are making a leading line of suits or coats of a close blue pilot. The jackets are leather lined and have the appearance of being both durable and of affording the necessary protection from the weather. The firm have already supplied a number of well-known automobilists with wearing apparel suitable for use when motoring, and in view of the attention that Mr. Holding is paying to this department other *chauffeurs* may be recommended to inquire for themselves into the merits of the Holding productions.

A LARGE steam omnibus has just been delivered by Messrs. De Dion to the Société Méridionale de Transports Automobiles for service in the Alais district.

IN answer to several inquiries we may mention that the name and address of the maker of the Sanciome motor-tricycle recently illustrated in these columns is M. Sanciome, Avenue des Salins, Clermont-Ferrand, France.

THE Daimler Motoren Gesellschaft, of Cannstadt are, according to our contemporary *La France Automobile*, constructing a motor in which a new metal is being extensively employed. Although developing 32 h.p. the weight will, it is stated, only be about 300lbs.

THE Thomson Motor-Car Syndicate, a concern recently formed in Victoria, write us that they would be glad to act as agents for motor-cars, accessories, tires, etc., in the Australian colonies. We shall be glad to give the address of the syndicate to any firm desiring such assistance.

THE Automobile Club is arranging a motor-cycle race meeting for Saturday, the 30th inst., to be held at the Crystal Palace. Those who wish to compete in this meeting are reminded that it is necessary that they should register themselves and their vehicles under the rules of the Automobile Club.

DR. Alfred Sternberg of the Protos Motorenfabrik, Berlin, W., has lately turned out a light three-seated motor-car fitted with a 3½ h.p. water-cooled motor known as the "Protos." The engine, which is very much on the lines of the De Dion, is provided with electric ignition. The little car is fitted with a variable-speed gear, giving a maximum of 30 kilometres per hour and reverse motion.

THE BORDEAUX-PERIGUEUX RACE.

(From our Own Correspondent.)

VERY great interest was manifested in this race, for it is long since a *course* for the big cars has been held; and, furthermore, it was known that several of the new types of racers would be making their maiden trials in this event. For a week or two prior to the race motor-men had keenly discussed the possibilities of exceptional performances, and the opinion universally expressed was that something altogether extraordinary might safely be anticipated. And this surmise has proved absolutely correct, for the times made by the leading cars on the first day, when the race was contested over 116 kilomètres of ideal road, were truly wonderful. First of all we had Levegh, who, mounted on his new Mors racer,* actually covered the 116 kilomètres in 84min. 35sec., or at an average speed per hour of 82½ kilomètres (51½ miles). Then came Giraud, driving this year's racing Panhard, of the type which will be employed in the Gordon-Bennett contest next week, and his time was but 2½min. slower than that of Levegh. Bostwick, who was third, was mounted on De Knyff's "Tour de France" car, which, as reported in these columns some few weeks ago, he bought at a very high figure. This was the American's maiden race in Europe, and it speaks volumes for his pluck and skill to have secured such an excellent place in the official list. His time for the distance was 91min. 43sec., showing an even better average than that made by De Knyff with the same car at Pau, which hitherto has been regarded as the fastest average made in a race. It is true the Pau course was considerably longer, but Bostwick's performance was certainly an eye-opener for those critics who had left the car out of their calculations on the supposition that the new owner had not had sufficient experience to be well placed. Maurice Farman, who was next on the list, drove a new Mors, but the third Mors representative, Antony, did not succeed in finishing. The times on the second day were not nearly so fast, for the hills of Périgueux at Angoulême had to be negotiated, in addition to a long stretch of *parvé* extending from Montlieu to Saint-André-de-Cubzac. Still, the foremost cars averaged somewhere in the vicinity of 70 kilomètres per hour for the 202 kilomètres of route!

The official classification for the two days was as follows, the total distance being 318 kilomètres:—

Two-seated cars:—1, Levegh, 4h. 9min. 45sec.; 2, Giraud, 4h. 12min. 36sec.; 3, Bostwick, 4h. 20min. 6sec.; 4, Farman, 4h. 44min. 7sec.; 5, Secrestat, 5h. 23min. 34sec.; 6, Barrow, 5h. 36min. 54sec.; 7, Champrobert, 6h. 31min. 23sec.; 8, Versein, 6h. 38min. 52sec.

Four-seated cars:—1, Maurel, 6h. 22min. 22sec.

Two-seated cars (8 h.p.):—1, Gondoin, 7h. 26min.

The official classification of the categories following the shorter route of 260 kilomètres was as follows:—

Cars (6-h.p.)—

	h.	min.	sec.
1. Lafitte...	6	9	17
2. Mauzan...	6	10	12
3. Gateuil...	6	50	51

Cars (5-h.p.)—

1. Lefebvre...	6	6	—
----------------	---	---	---

Voitures—

1. Théry...	4	40	17
2. Camus...	6	16	—
3. Schmidt...	7	5	49
4. Cornilleau...	7	19	29
5. Bord...	8	37	—

Tricycles—

1. Cormier...	4	26	39
2. Jourde...	4	31	—
3. Joyeux...	4	33	—
4. Chrétien...	4	34	36

Quadracycles (two seats)—

1. Lafargue...	5	44	46
2. Barreau...	6	14	14

* This car is illustrated on another page of the present issue.

FURIOUS DRIVING CASES.

At Stratford, on Saturday last, the Earl of Carnarvon, of Berkeley Square, W., was summoned for furiously driving a motor-car to the danger of the public at Epping New Road, Woodford, on May 17. The defendant, who did not appear, was represented by Mr. Frere. Constable Tyler, 204 J, said that on the day in question he saw a motor-car coming towards him at the "flying rate" of twenty miles an hour. He and another constable stepped into the roadway and put up their arms for the car to stop. The defendant pulled up the car about thirty yards away, and, when told he was going too fast, he asked, "At what pace was I going?" witness said, "Twenty miles," and the defendant answered, "I did not think it was as fast as that—it was about twelve miles." In answer to Mr. Frere, the constable said he did not admit to the defendant that it was about fourteen miles an hour, or that the pace was not dangerous. Constable 585 J corroborated, giving his opinion that the pace was twenty miles an hour. A cyclist named Scott, of Woodford, deposed that he was riding along at about ten miles an hour and the defendant's car passed him "like a flash," going twice as fast as he was. Another witness deposed that the car passed him "like an express train." Mr. Frere, for the defence, said Lord Carnarvon was only driving at the rate of about twelve miles an hour. The defendant was summoned at Newbury about a month ago for a similar offence, but the case was dismissed. He had no witness in this case. The Bench, making no comment, imposed a fine of 40s. and 11s. costs.

At the Halifax Borough Court last week, Mr. J. S. Stafford, of Bell Hall, was charged with furiously riding a motor-cycle in Skircoat Moor Road on Saturday, the 19th ult. Police-constable J. Greenwood and another officer deposed that on the evening in question the defendant was riding at a very excessive pace. The defendant on the other hand denied at any time exceeding the maximum regulation speed of twelve miles an hour. The Chairman (Mr. J. Shoesmith): I have latterly seen the driving and riding of motor-cars and cycles on the Moor with very great regret, and it is high time it was stopped. A penalty of 8s., including costs, was imposed.

At Coleshill, last week, Mr. Sydney Letzar and Mr. Arthur Drake, in the employ of the Daimler Motor Company, Ltd., Coventry, were charged with furiously driving two motor-cars at Fillongley. Police-constable Price informed the Bench that the cars were travelling at the rate of about 30 miles an hour through the village. Thomas Hughes, farmer, said he saw the motor-cars coming down Hob Golling Hill at "railway speed," leaving behind them clouds of dust. John Townsend, another farmer, said the pace was 25 to 30 miles an hour. The defence was that the speed was 18 miles an hour.—Defendants were fined £3 and 21s. 6d. costs each.

BEFORE the Guildford Borough Bench last week Mr. R. Dennis, 94a, High Street, was summoned for furiously driving a motor-car in High Street on May 18th.—Defendant denied that he was going at a pace to the danger of the public.—P.C. Arnold stated that about 10.25 p.m. on Friday, the 18th ult.—the night of the receipt of the news of the relief of Mafeking—he saw the defendant driving a motor-car down the High Street. He was going at a very fast rate. The streets were crowded with people, and as there was a lot of shouting and horns blowing, it was impossible for people to hear defendant's warning. Witness shouted to him to go steady. People had great difficulty in getting out of the way, and on passing the Lion Hotel he considered the motor was travelling at fourteen miles an hour. Defendant said he thought witness had exaggerated the case. It was absolutely impossible to get through a crowd, such as there was on the night in question, at the rate of fourteen miles an hour. He had come in from the country that evening, and had no idea that the news of the relief of Mafeking had been received, otherwise he should have gone by way of North Street. He had perfect control over the motor, and could have pulled up in two yards. Of course, it was difficult to get people to realise the fact that those who drove motors had far more control over them than people who rode bicycles or drove. The Mayor said the Bench acknowledged that defendant had a perfect right to a proper use of the road, but at the same time the safety of the public must be considered, and they were unanimously of opinion that defendant was doing very wrong in driving at the fast rate he evidently did through a crowd. He would be fined £1 and 13s. costs.

At Wigton (Cumberland) Police Court, on Tuesday, Mr. Clarence Knight Gregson, St. Edmund's Terrace, Regent's Park, London, and his driver, Verey Braman, who took part in the Automobile Club's 1,000-Mile Trial, were summoned for furiously driving a motor-car at Lowood Nook, near Wigton, on May 1st. Lord Gillford, of Snittlegarth, said the defendants descended a dangerous hill at over twenty miles an hour. Defendants, through their solicitor, to save the cost of the journey from London, pleaded guilty. Superintendent Ross said the chief constable of Cumberland had received many complaints of furious driving during the club's Trial, and wanted the public to be protected. A fine of £1 each and costs was imposed.

THEODORE CARL, a Dalston gentleman, was also fined £1 for a similar offence. A police constable said defendant covered a mile in two minutes, and stated that the speed was thirty or forty miles an hour. Defendant contended it was impossible to negotiate corners at that speed.

FIRE AT A MOTOR-CAR DEPOT IN ABERDEEN.

A FIRE of an alarming and destructive nature completely destroyed the workshop and motor store of the Caledonian Motor-Car and Cycle

Company, Limited, to the rear of their premises at 285, Union Street, Aberdeen, on Tuesday. The fire broke out shortly before three o'clock, and in less than ten minutes the interior of the building was one mass of flame. It appears that the young man whose duty it is to take the *Daily Free Press* motor-car from the depot to the office for the despatch of the early edition of the paper, had neglected to procure oil for the car the previous night. He proceeded in the dark to obtain oil from another motor, and, to facilitate matters, lit a match, with disastrous results. The moment he flung down the match the oil that had dripped on the floor was ablaze, and though he endeavoured to run the car out of danger, the flames followed, the tap of the reservoir being loose. Running to Campbells, Limited, the messenger informed the employees there of the catastrophe, but the men, who were quickly on the spot, were driven back by the overpowering smoke which was pouring through the door in Langstane Place in suffocating volumes. Meantime, however, the Fire Brigade had been summoned, and with characteristic promptitude soon had the hose reel and steamer playing upon the burning building. The roof, which was of glass, rendered their work difficult and dangerous, but in a short time, despite the highly inflammable nature of the petroleum oil and indiarubber solution, which was stored in considerable quantities, the fire was got under. It is satisfactory to note that the front showrooms and stock were not touched to any extent, but the rear part of the building was completely wrecked. Five motor-cars and a large number of cycles were destroyed, while the machinery and tools for repairing were greatly damaged. The total damage cannot be far short of £2,000. The driver of the motor was burned rather severely about the hands. — *The Aberdeen Free Press*.

A MOTOR-CAR ACCIDENT IN SCOTLAND.

ISSUES were ordered in the First Division of the Court of Session last week in an action by William M'iver, coachman, 9 Hope Street, North Leith, against the Edinburgh Autocar Company, Limited, London Road, Abbeyhill, in which £100 is claimed for personal injuries. On 27th March last a collision occurred in Lothian Road between a carriage driven by the pursuer and an autocar belonging to the defenders. Pursuer avers the car was on the wrong side of the street, and that as a result of the collision he was confined to bed for a fortnight. The defenders deny that the accident occurred through the fault of their driver, and plead that, in any case, the sum sued for is excessive. The defenders have, they state, offered the pursuer reasonable compensation.

NEGLECTING TO STOP.

ON Tuesday last week, at the Atherstone Petty Sessions, Mr. Walter Macfarlane, electrical engineer in the employ of the Daimler Motor Company, was summoned for being in charge of a motor-car and neglecting to stop when requested to do so by the driver of a restive horse in Coleshill Road, Atherstone, on April 14th. Defendant pleaded not guilty, and was represented by Mr. Alfred Sale. A coal carter, named John Wilson, stated that he was standing with his horse and dray in the road named when the defendant came behind him with his motor-car. The "jiggering" noise made by the car frightened his horse, and witness only just succeeded in quieting it when the motor horn sounded, and the animal again became restive. He held up his hand as a signal to defendant to stop the car, but this was not done. Witness lost control of the horse, which bolted, and several children narrowly escaped being knocked down. Defendant said that when he first saw the horse and dray they were unattended, and he sounded his horn. Complainant came out of a yard, and he did not then see him hold up his hand as a signal to stop. He was certainly not going at more than two miles an hour at that time. When the horse became restive, complainant held up his hand, and he (defendant) immediately stopped the car. If complainant had exercised proper control over the horse, it would never have bolted. Defendant added that he had charge of four Daimler motor-cars in the recent 1,000-mile Trial, and had never then nor previously had a charge brought against him. Mr. Sale said the whole question was whether the defendant stopped the motor-car, as required by the bye-laws, when he saw complainant's hand held up, and he submitted that he did. The Bench, however, considered the case proved, and imposed a fine of £2 and £1 9s. costs.

INJURIES TO A HORSE.

In the Falkirk Sheriff Court last week Sheriff Bell was engaged hearing evidence in an action at the instance of M'Laren Brothers, carriage hirers, Stenhousemuir, against the Falkirk District Motor Company, Limited, in which the pursuers sue for £26 in name of damages for injuries sustained to a horse belonging to them through a motor-car belonging to defenders having been run into it on 21st October last, on the road between Stenhousemuir and Carron. Pursuers led evidence to show that on the date mentioned one of their omnibuses was proceeding along the road on its run from Stenhousemuir to Falkirk when one of the defenders's motor-cars overtook it and in passing struck one of the outside horses first on the hip and then on the fore-leg, bringing it to the ground and injuring it to such an extent that it was in the stable under veterinary treatment for six weeks, and was now of little use as a horse for the road. The pursuers put the value of the horse at £30 before the accident and £7 or £8 since the accident. Defenders, who denied liability, brought expert

evidence to show that the value of the horse was over-stated by pursuers while the driver of the motor-car denied having injured the horse in any way. After hearing parties' agents the Sheriff made *avizandum*.

MOTOR-CYCLE RACING AT THE CRYSTAL PALACE.

THE fine weather attracted many thousands of onlookers to witness the motor and cycle races at the Crystal Palace on Monday last. Principal interest was centred in the hour motor race for the Crystal Palace Brassard and the Century Cup Race. The Brassard proved an easy win for M. Rigal, whose machine was more powerful than those ridden by his opponents. The following are the results of the various races:—

Five-mile Race for Roadster Machines.—J. Cusins, scratch, 1; A. McCormack, half a lap start, 2; M. Moyle, three laps, 3. Won easily by over a lap. Time, 8min. 40sec. Cusins, who finished first, was disqualified for wrongful description of machine.

Ten-mile Handicap (any machine).—C. Machin, scratch, 1; Rigal, scratch, 2; J. Cusins, six laps start, disqualified. Rigal's machine went wrong when he had covered seven miles, and Cusins, with his two miles start, won easily by a mile and a half. An objection was raised against the winner, and after an inspection of the machine this was upheld, and Cusins was disqualified. Time, 12min. 45sec. Rigal's time for the full distance was 15min. 47sec.

Mile Time Trials (flying start).—M. Rigal, 1min. 27 4-5sec.; C. Machin, 1min. 31sec.

One Hour Race for the £110 Crystal Palace Brassard (holder, C. Jarrott).—The following riders competed: V. Lee, C. Machin, F. F. Wellington, and M. Rigal. After the first two miles had been covered Wellington and Machin were practically out of the race, and at three miles Rigal took a definite lead. At twenty-one miles Rigal was leading Lee by a couple of laps, when the last-named had to change machines. Lee persevered in a plucky manner, but was unable to hold Rigal, who won easily by nearly four miles. Rigal covered 19 miles 590 yards in the half-hour, and 38 miles 1,372 yards in the hour. The previous British record by C. Jarrott was 38 miles 360 yards. The following are Rigal's times:—

Mls.	Leader	Time.	Mls.	Leader	Time.
1	Rigal ...	1 35½	20	Rigal...	31 9½
5	Rigal ...	7 39	30	Rigal...	45 33½
10	Rigal ...	15 22½	35	Rigal...	54 13
15	Rigal ...	23 14			

THE BEESTON MOTOR COMPANY, LTD.

MR. JUSTICE WRIGHT had before him last week the petition of Mr. H. Osbaldeston Duncan for the winding-up of the Beeston Motor Company, Ltd.—Mr. Clare said he believed the petition was about to be withdrawn, and if the case was not again mentioned the Court might conclude that that had been done. Later in the day Mr. Clare said it was preferred that the petition should be dismissed instead of withdrawn.—The petition was accordingly dismissed.

AN American contemporary reports that the lack of carriages for hire at Buffalo, N. Y., owing to the cabmen's strike, resulted the other day in the spectacle of a funeral procession, including the hearse, made up of electric vehicles. As the undertakers in charge of the funeral had agreed with the Cabmen's Union not to use carriages driven by non-union men, they had to have recourse to an electric vehicle transportation company for carriages to convey the funeral party to the cemetery. Fifteen electric carriages were in line, the hearse being also self-propelling.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, JUNE 16, 1900.

[No. 67.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AUTOMOBILISM has reached the altitude of Society, and with the Prince of Wales as the owner of a car, which he intends ultimately to drive himself, the industry has received a recognition that must have a great effect. We are glad that the Prince has waited for his car until a British concern could make a vehicle equal to the best cars of French production—thus showing his interest in the British industry, as well as his appreciation of modern inventive skill. Last week he drove about Sandringham for the first time on a motor-car, and on Wednesday at Ascot he took his first trip on his own car, driven by his own mechanician. Elsewhere

we reproduce photographs of the car, the mechanician (Mr. S. Letzer), and the instructor (Mr. Oliver Stanton), with whom the Prince has already taken lessons; and doubtless the time is not far distant when the Prince himself will be photographed on the car.

The 1,000-Mile Trial.

Meanwhile we are able to give on another page the first official tables with regard to the daily performances of the various vehicles, and the results of the hill-climbing and speed competitions. These, with the remarks appended, afford a comparison of the performances of the various cars, but intending purchasers should remember that further observations will shortly be issued by the judges, and that they should also be taken into consideration as well as the reports published this week.

Motor-Cycle Race Meeting.

On Saturday, June 30th, a motor-cycle race meeting will be held at the Crystal Palace under the auspices of the Automobile Club, when there will be a handicap for members of the Club only, and three open events—viz., one hour scratch race, ten mile handicap, and a five mile race for roadsters. In each contest at least ten entries must be received a week before the date of the projected meeting, or the race will not take place. All competitors will have to register themselves and their vehicles with the A.C.G.B.I., under whose rules the competitions will be held. It is believed that cups will be offered for the winner and second in each of the first three races and medals for the winner and second in the last race. Mr. Campbell Muir has already promised a silver cup in connection with one of the races. The handicapping will be undertaken by the Competitions Committee of the Club.

Hill-Climbing Contest.

On the same day that the above meeting is contemplated the Catford Cycling Club will hold a hill-climbing competition for cycles on Westerham Hill, and it is possible that a hill-climbing competition for motor-cycles and motor vehicles may be held, under the A.G.C.B.I. rules, in conjunction with that event. As the meeting at the Crystal Palace will be from three to six p.m. on the 30th it might suit the convenience of competitors who desire to go in for the hill climbing trials if the Catford Club could arrange to commence the motor-cycle and motor-vehicle contests at seven p.m. This, we hope, will be considered so that the suggested trials might be participated in by the largest possible number of contestants.

A Trip from Liverpool.

MAINLY interested in heavy traffic vehicles, the Liverpool Self-Propelled Traffic Association adopted a lighter mood on Saturday, when a pleasant run of about sixty miles was enjoyed by some of its members and friends. A start was made at Woodside, on the Mersey, shortly after noon, and lunch was taken at the Grosvenor Hotel, Chester. After the interval the journey was resumed to Knutsford, at which interesting Cheshire town a halt was made for tea and conversation. From thence the return trip to Liverpool was made, all having thoroughly enjoyed themselves.

Those who Participated.

UNFORTUNATELY the threatening weather caused several who had decided to go to withdraw, and in some places the roads were rather heavy. But those who did venture had a pleasant time, and the success of the day should warrant the institution of similar runs at other places where several residents own automobiles. The participants in Saturday's trip included: Professor Hele-Shaw and Mrs. Hele-Shaw (New Orleans voiturette), Mr. John A. Brodie and Mrs. Brodie (Stanley steam car), Mr. F. E. Baron, Mr. J. Walwyn White and Mrs. White, and Mr. O. H. White (Daimler phaeton); and Mr. Walter Featherstone and Mrs. Featherstone, Mr. Johnson, Mr. H. Wardle Rush-ton and Mr. Dawson Kimpton (Daimler wagonette). Mr. Shrapnell Smith, the hon. secretary of the Association, was on a Perfecta tricycle. Two members of the staff of Messrs. Souvestre and Company, Ltd., accompanied the party on a quadricycle to provide for contingencies, but, happily, their services were not required.

Photographic Competition.

MR. EDMUNDS has made a splendid offer in connection with the photographs taken during the 1,000-mile Trial which should result in a fine collection being obtained by the Automobile Club. As the time for sending in photographs has been extended to July 15th, those who have not yet sent in photographs have still ample opportunity to do so. Three prizes,

of five, two, and one guinea respectively, have been offered by Mr. Edmunds for the best twelve photographs taken of the Trial, and the competition is open not only to the participants but also to any member of the public who photographed anything of interest connected with the run. The judges are Messrs. Edmunds, Kennard, Sturmey, Cordingley, and Johnson, and, if thought desirable, they will retain any of the photographs entered for the competition so that the Club's pictorial record may be made complete.

A Non-Stop Run of 400 Miles.

MR. T. E. OUTHWAITE, of Edinburgh, is well known as a motorist who enjoys long non-stop runs. In April he went from Edinburgh to Selby, a distance of 221 miles, before stopping, making an average of fourteen miles per hour. He is now anxious to come from the modern Athens to the modern Babylon—a trip of 400 miles—without stopping; and has also designs upon the record made by Mr. J. W. Stocks, who rode from Edinburgh to London on a motor-tricycle. The latter feat he proposes to accomplish on a 2½-h.p. De Dion tricycle; the former on a 6-h.p. Daimler car.

Trial of Heavy Traffic Vehicles.

ON another page we give particulars of the trials which are being organised for June of next year by the Liverpool Self-Propelled Traffic Association. These are intended to provide a means of making a preliminary test of types of heavy motor-wagons suitable for haulage operations in Lancashire prior to their being taken over by a Lancashire syndicate which is to be formed to conduct road transport between Liverpool and the manufacturing towns of Lancashire. Loads of general merchandise will be collected and delivered during the tests, thus giving practical demonstrations, and the trials will be from Liverpool to Manchester *via* Warrington, from Manchester to Liverpool *via* Bolton, from Liverpool to Blackburn *via* Chorley, from Blackburn to Liverpool *via* Preston, each journey to take place on one day in the first week of June. There will also be hill-climbing at Everton Brow and manoeuvring at Prince's Dock. The vehicles will be tried in three classes, and the judges, in making the awards, will consider (a) cost, (b) control, (c) working, (d) construction, (e) special points with regard to vehicles propelled by steam, oil or electricity respectively. The competition will be of an international character, and the results should have an important bearing on the future of the industry.

Presentation to Mr. Critchley.

AFTER four years' loyal service with the Daimler Company Mr. J. S. Critchley, M.I.M.E., has left that concern to become the manager of the British Electrical Traction Company, and on Friday last those who had been associated with him at Coventry made a presentation. This consisted of an illuminated address and a silver tea service, the former being the work of Mr. Grahame White and testifying to the high appreciation in which Mr. Critchley is held by the staff, foremen, and employees of the Daimler Motor Company, who gave the most hearty good wishes for his future welfare. The presentation was made during a smoking concert at the King's Hall, Coventry, by Mr. A. G. Drake, and in returning thanks Mr. Critchley said the success of the company had been due not only to him, but to those around him. Taking the same power cars the Daimlers were equal to any of the French cars—a fact that had not been appreciated by many people in England. After thanking those present for their kindness in making the presentation, he said he should always look back with pleasure to the time he had been with the Daimler Company. Several others with whom he had been associated also spoke, all voicing the general regret at Mr. Critchley's departure, and expressing good wishes for his future.

Motor-Vehicles among Agriculturists.

TO-DAY (Saturday) the implement section of the annual show of the Royal Agricultural Society opens at York, and the opportunity of introducing automobiles to the notice of the several thousand people visiting that meeting will not be lost, for we hear that the Motor-Car Company, Ltd., will have a Decauville and a M.C.C. Triumph car on exhibition at their stand. The Lancashire Steam Motor Company, of Leyland, will show a steam motor-lorry constructed to carry loads up to four tons. They have also entered for exhibition a steam motor tip wagon to carry loads up to four tons. Its capacity is six cubic yards, and it can be easily tilted by one man when fully loaded. Mann's Patent Steam Cart and Wagon Co., of Leeds, are to show a patent steam lorry to carry a five-ton load, burning ordinary coke, and a patent steam tipping cart which will climb hills as steep as 1 in 5. An 8-h.p. motor-wagon engine is also entered by Messrs. H. P. Saunderson and Co., Ltd., Bedford. We may add that the Lancashire Steam Motor Co. have entered their motor tip wagon for one of the Royal Agricultural Society's silver medals.

Motor-Cars at the Seaside.

WE shall be pleased to have news of the various motor-car services at seaside towns, and to chronicle incidents during their summer runs. Although the opposition to such public conveniences is still keen in many interested quarters, it is declining in strength in several districts where automobiles were formerly regarded as nuisances, and some new services will be inaugurated this year. At the last meeting of the Bexhill District Council four licences for motor-cars to ply for hire in that charming district were granted to Mr. J. Byrne, whose enterprise should meet with encouragement from the many visitors likely to be attracted to Bexhill-on-Sea during the season.

Motoring in Hyde Park.

HYDE Park is being appreciated by motorists, and any day numbers can be seen in the line of traffic encircling the park. On Saturday two ladies were seen driving a Marshall car, and very charming they looked, attracting much attention; while on Sunday a Twin Daimler was also being driven at a nice steady pace by a lady. Some carriage horses are still not comfortable when motor-cars are about, while the policemen in the park certainly look upon automobiles as matter out of place, and woe betide the automobilist who does not pull up *instantly* when called upon to do so! Frequently comes the exclamation, "You are going too fast!" The ladies on the Marshall car had been so warned on Saturday, and were kind enough to inform us of the close watch being kept on automobilists. Not only are the police abnormally active, but we notice several correspondents in the daily papers are wasting their time in writing against the presence of motor-cars in Hyde Park. Surely such a public place was never intended as a monopoly for horses and obstinate men who go on foot and write letters to the papers.

A "Star" Performance.

ONE of the steepest hills in the country is at Birdlip, near Gloucester, and there, on Saturday, a 3½-h.p. Star car, fitted with a two-speed gear, distinguished itself. It had been driven from Wolverhampton to Gloucester by Mr. E. H. Lisle, of the Star Motor Co., performing the journey in about four hours. At the latter city Mr. Lisle was met by Mr. Clarke (of the firm of Clarke and Morgan) on his 3-h.p. Benz car, fitted with three speeds, who went half way up Birdlip Hill and waited for the Star car, which soon afterwards came along in capital style at six miles an hour, but she could not at the first attempt get so far as the Benz. A second trial was made, however, and the top of the hill would undoubtedly have been reached but for the fact that one of the chains, being loose, came off. This necessitated a third trial, which the Star accomplished in good style, not drawing up until she stood outside the George Hotel.

Mr. Lisle was delighted with what the vehicle had done, and confidently expressed the opinion that there was not another two-speed car in existence which could do the same thing. The perfect control which the driver has over the car was shown on the journey from Birdlip to Cheltenham, for the several sharp descents were made in perfect safety at a good pace, and even the Leckhampton pitch presented no difficulties. The journey back to Wolverhampton was made in remarkably good time.

Smoke Room Chat.

Not the least enjoyable feature of the Automobile Club Tours is the after dinner chat in the smoke room of the hotel, when the incidents of the day are talked over. It would need a Pepys to record the many good things said. These, we may mention, turn largely on the Hippomobile question. At Cambridge a racy raconteur was in good form, and had the ear of the room for some time; his experiences of what can even now be termed the early days of automobilism being especially rich. The horsey tales and the *suaviter in modo* of dealing with angry drivers by presenting them with a leaflet containing extracts from the Light Locomotives on Roads Act, especially appealed to the listeners, to say nothing of an account of an early run out on a Bollée with a friend. Neither knew anything of the car, and it was not surprising the venturesome spirits were soon in trouble. However, they persevered, until at last the whole of the motor tumbled into the road. There were hundreds of little pieces and parts, screws and nuts—said the narrator. These were carefully scraped together and gathered up and the car pushed to the nearest hostelry. The landlord came out, looked at the wreckage, and demurred to stabling it. At last he said he would take it in if they would leave some security that they would fetch the “thing” away again. The only security they had was the fur-lined overcoat which one of them was wearing, and this the landlord condescendingly took. Of course, the car was sent for, and when the fitter had possession he was handed the fur-lined coat, with the remark: “Here’s the security!” Knowing the cost of the vehicle, the fitter—well, nearly dropped the latter end of his trade.

Southampton to Bournemouth.

LAST week we referred to the deputation that went from Southampton to Bournemouth to inquire into the possibility of running motor-cars in place of buses. Not only was inquiry made at Bournemouth, but a trip on one of the Motor Manufacturing Company’s wagonettes was also enjoyed from Southampton to the fashionable watering-place—a distance of thirty miles. Starting from the Tramway Junction at three o’clock the car reached the Crown Hotel at Lyndhurst in three-quarters of an hour, and after a short stay the journey was resumed at four o’clock. Plunging into the heart of the New Forest a halt was made so that the deputation might visit the famous Knightwood Oak, and then the Motor-Car Dépôt at Boscombe was reached at 5.50 p.m., the actual running time having been two hours and fifteen minutes with seven passengers aboard. It is understood that the Southampton deputation was very favourably impressed with the ten motor-cars which Mr. Bell has in the public service at Bournemouth. Three other cars are now being delivered to him.

Progress in Belgium.

THE Belgian automobile industry is bound to benefit considerably by the interest manifested in the movement by Prince Albert of Belgium, who is himself an enthusiastic *chauffeur*, and who quite recently was to be seen driving in an electromobile through the streets of Antwerp. The Prince’s fiancée, the Duchess Elizabeth, is also a firm believer in the self-propelled vehicle, upon which she frequently makes long drives. Favoured with royal patronage, automobilism should march apace in Belgium, and one learns with regret that its progress is likely to be retarded by reason of dissensions in the Automobile Club of Belgium. If reports are to be believed, a serious split is likely

to take place in the camp, and a repetition of the Automobile Club of France affair is by no means unlikely.

A Doctor’s Car.

AMONG medical men who are doing much to popularise the use of the motor-car by members of the profession is Dr. Hardwicke, of East Moulsey, near Hampton Court. In September last he bought a Benz car, and since then has never had occasion to use a horse, even for a single day. The accompanying photo shows the doctor ready for a drive, with Mrs. Hardwicke as a passenger. The car has done the work of

his practice throughout the winter, and during the floods went through more than two feet of water without difficulty or damage. Dr. Hardwicke drives the car frequently over Oxshott Heath, one part of which has a very steep gradient. The hood is a movable one, and when removed the car can be used as a dog-cart. This is further confirmation of the suitability of motor-cars for doctors, securing economy of time and money, and thus adding to the pleasures of life in the country.

Getting Reasonable.

THE Borough Bench at Eastbourne has shown a reasonableness that might not only be usefully imitated on other Benches throughout the country, but also by other bodies in the town of Eastbourne itself. Two licensed motor-car drivers were summoned for alleged furious driving. There was the usual conflict of evidence—the police not only asserting that a speed of twelve miles an hour was being reached, but that the defendants were racing, and other witnesses confirming the evidence of the drivers that they did not exceed seven miles an hour. The chairman of the Bench recognised that the public appreciated motor-cars, and imposed a light fine, as the particular case was not an aggravated one.

The Automobile Coach.

QUITE a new departure in Parisian automobilism has been initiated by the Compagnie Routière de France, who last week commenced a regular automobile service between Paris and Fontainebleau. The vehicle used is a 12-h.p. Panhard, and it seats twelve passengers, much on the same lines as an ordinary coach. Standing fairly high, it permits of the

voyagers seeing the country excellently, while its awning and side curtains protect them against the sun. Every Monday, Wednesday, and Friday, the car makes a run, the itinerary being as follows:—Departure from the offices of the *New York Herald* in the Avenue de l'Opéra at 8.30 in the morning; route by way of Choisy-le-Roi, Villeneuve Saint Georges, Montgeron, Lieusaint, and Melun, to Fontainebleau, which is reached in time for a midday "dejeuner" at the Hotel de France et d'Angleterre; departure from Fontainebleau at 3.30 in the afternoon; route by way of Barbizon, Chailly, Melun, and Choisy-le-Roi to Paris, the arrival being timed for seven o'clock. The price of a ticket for the entire trip of some one hundred and thirty kilometres is thirty francs, while a lousis is charged for the outward or return journey alone. The enterprise seems likely to command a big success, for so far the car has regularly carried a full complement of passengers, and performed its duties with ease and punctuality.

Suggested American Competition.

SUGGESTED by the success of the 1,000-mile Trial in Great Britain, a competition to attract attention to the industry is in contemplation in the United States. A race which was arranged in America some time ago was not a success, and the failure of that event has made the leaders of the movement timorous. But improvement has since taken place and the automobiles of the present day are very different to the machines of only a few months ago. The Board of Governors of the Automobile Club of America is anxious that a series of trials or competitive tests should take place—the main points to be considered being the stopping and turning of vehicles, the avoidance of obstacles, etc., on different road surfaces. Acting on this wish a technical committee of the Club is preparing the details, and it is probable that the actual tests will take place in New York during the autumn.

MR. OLIVER STANTON.

Where Education Needs Completion.

A YOUNG gentleman on the staff of the *Norfolk Daily Standard* complains that "the hissing and sputtering, the queer vibrations, the odour of hot grease and other things," which he regards as inevitable in the motor-car, "tend to make us keep the motor-car at arm's length, without taking into question the nervous apprehension of disaster arising out of the high speed some of the more intrepid riders affect." Apart from the curiosities of language shown by the young man the paragraph

contains much of interest. Not only does the car "sputter," but it hisses and smells, and in addition to the usual vibrations has some "queer" vibrations which, in combination with the "odours of hot grease," have alarmed an unoffending journalist. Desiring to warn an unsuspecting public he thus displays a wonderful lack of acquaintance with his subject, and presents one of the instances where the educational efforts suggested by "Trade-View" last week should be made. We hope some owner of a motor-car in Norfolk will give the staff of the *Norwich daily papers* the opportunity for a trip, and so help them to accuracy when writing of automobilism.

An Automobile Highway in the States.

OFTEN have we pointed out the improvement of English roads that will result from the extended adoption of automobilism. This is even more apparent, or rather is likely to be more quickly realised in the United States, where Messrs. John D. Quackenbos, formerly a professor in Columbia University; John Hay, Secretary of State; Gov. Rollins, of New Hampshire; and N. J. Bachelder, Secretary of the New Hampshire Board of Agriculture, are reported to be interested in a project for a 500-mile road for the exclusive use of motor and pleasure vehicles through the most delightful scenery of New Hampshire. The cost of construction, exclusive of the land, will be 3,000,000 dollars. President Chamberlain, of the Automobile Club of America, is deeply interested, and has asked for connections from New York and Philadelphia. These connections will go through the Berkshires and join the main road at Hanover, either by way of Bennington and Brattleboro or by the Rutland Pass. When asked as to the length of time which would be required for the construction of the road, Professor Quackenbos said he expected to see it completed within five years. The road, he said, would be of macadam. Whether the road-bed would be entirely new or partly composed of old roadway worked over, he said, had not been settled. This is considerably more ambitious than the project mooted in these columns for a five-mile motor track near London. The fact that motorists on both sides of the Atlantic are interested in such schemes shows that there is a real need for an automobile highway, and everything tending to help such projects should be encouraged.

A Car in a Dyke.

THIS is how the *Yarmouth Independent* reports the running of a motor-car into a dyke: "Whilst a motor-car was running at a good rate from Yarmouth on the New Acle Road on Tuesday an accident happened to the steering gear, which caused the machine to swerve and fall into the dyke by the side of the road. The occupants were only Mr. Palmer, of the Duke's Head Hotel, Yarmouth, and the driver, both of whom were a good deal shaken. Mr. A. E. Smithdale, engineer, and his man were sent for, and after some time were able to get the car again on the road." We have italicised one word, the effect of which should be studied by the local reporter.

A SUCCESSFUL rallye-papier between St. Germain and Les Mureaux was held by the Rallye Auto Club at Paris, on Whit Monday.

THE long-distance race for motor-cars, from Salzburg to Vienna, promoted by the Austrian Automobile Club, was won by Dr. Richard Stern, of Vienna, on a Daimler car. His time for the journey was 3h. 6m. 2sec.

AMONGST the first automobilists to register themselves and their vehicles under the competition rules of the Automobile Club of Great Britain and Ireland is Mr. S. F. Edge, who has registered two motor-tricycles and his 16 h.p. Napier car.

THE United Motor Industries, Limited, has been registered, with a capital of £1,000 in £1 shares, to carry on business of motor-car, motor cycles, and bicycle, tricycles, velocipede, and carriage manufacturers and agents, motor and cycle accessory manufacturers, etc.

Royalty and Automobilism.

THE PRINCE OF WALES'S FIRST MOTOR-CAR.

[SPECIAL.]

THAT Society will recognise the advantages and delights of automobilism is a fact frequently mentioned in these columns, and the chronicle, from time to time, of new adherents to the new sport has demonstrated its ever-increasing number of devotees in fashionable circles. Practical motorists will readily recognise how well adapted to the requirements of the aristocracy is the automobile, and were glad to learn recently that H.R.H. the Prince of Wales had determined to associate himself with the sport and pastime of motoring. On the Continent and at home he has watched the advances made from year to year, and it afforded infinite satisfaction to those who are hopeful of a great extension of the British automobile industry to know that he had ordered an English-built car, which has just been delivered.

An interview was recently published in the *Motor-Car Journal* with Mr. Oliver Stanton, who was the cycling tutor of the Prince of Wales, and we have pleasure in announcing that that gentleman has initiated the Prince into the mysteries and the mechanism of his car. We understand the Heir-Apparent intends to become thoroughly proficient, and his accession to the ranks of automobilists should do much to give an impetus not only to automobilism in this country, but also to the British motor-car industry.

There have been many reports current during the past few months as to the car which had been ordered, through Mr. Stanton, by the Prince of Wales, but none of them have been of an authoritative character. We ourselves have naturally been cognisant of these rumours, but decided to hold over all reference to the Royal car until it was *un fait accompli*, and until such time as we could give definite details of the actual vehicle.

This we are able to do this week, and by the kindness of Mr. G. Foster Pedley, of the Daimler Motor Company, Limited, we are in a position to publish a couple of illustrations of the car which has just been delivered to His Royal Highness. The vehicle itself, on which we have had the pleasure of a short trip, is one of the Daimler Company's standard type, the frame being that known as Model A. The motor has the usual two cylinders, and is of 6 h.p., an innovation being the fitting of double ignition, both electrical and by means of an incandescent tube. The electrical ignition is normally relied upon, the burners being kept as a reserve. The adoption of double ignition necessitates but a small alteration to the motor; the sparking plugs are located in the top of the

cylinder head; the induction coil adopted is one of Blake's, and so far the arrangement has given complete satisfaction. A new departure in connection with the motor is that the "accelerator" is controlled by a foot pedal in place of the hand lever hitherto employed. In the construction of the motor aluminium has been used as far as possible, the crank chamber, etc., being made of that metal. The transmission gear is of the usual Daimler pattern, giving four speeds ahead and reverse motion, the change of speed being controlled by a hand lever at the side. The car is speeded up to a maximum of about twenty-four miles.

A few details may now be given regarding the "body."

The coach-building part of the work was entrusted to Messrs. Hooper and Co., Limited, of St. James's Street, W., and it is needless to add that they have carried out the same in an eminently satisfactory manner. The "body" takes the form of a mail phaeton, with seating accommodation for four persons. The woodwork is painted in the Royal colours—chocolate and black, picked out in red. The upholstery has been finished in colours to match, and altogether the car has a quiet and stylish appearance. Beyond the painting, the only indication that the car belongs to Royalty is His Royal Highness's small crest affixed to one of the panels behind the lamp on the left side. The front seat is provided with a collapsible

MR. S. LETZER (THE PRINCE OF WALES'S MECHANICIAN) ON H.R.H.'S CAR.

Photo by]

[Messrs. Curzon, Robey & Co.

hood; this is of a new type so far as English motor-cars are concerned, it being constructed on the lines of the American buggy hoods, the back being made to roll up, thus enabling the hood to be used as a canopy in bright sunny weather, such as has been experienced during the past week. The road wheels are of wood, shod with Clipper pneumatic tires; the mudguards or splashboards are of leather, and of a much greater width than usual. Steering is controlled by an inclined hand wheel, the standard of which is pivoted at the bottom, so that it may instantly be placed in a vertical position to facilitate mounting and dismounting.

Having briefly dealt with the leading features of the Royal car, which does credit to all concerned in its production, we may devote a little space to its career during the past few days. His Royal Highness last week spent a good deal of time at Sandringham in learning the mysteries of the motor-car under the guidance of Mr. Stanton, on the latter's new Daimler mail phaeton. The Prince quickly learned how to manage the reins, or rather the steering wheel, and it was not long ere

he was driving the car on second speed in the grounds of his Norfolk residence. So pleased was the Royal *chauffeur* with his experience that he was eager to see his own car, which made its *debut* at Ascot on Monday last. The question of a reliable mechanic was a matter not settled in a day, and, after much deliberation, Mr. Sydney Letzer, who is shown seated on the car in one of the accompanying illustrations, was selected for the responsible position. Mr. Letzer has been with the Daimler Motor Company, Limited, for about two and a half years, and has a thorough acquaintance with the vehicle of which he is now in charge. The car was driven down to Ascot on Monday afternoon, having as passengers Lord Suffield and the Right Hon. Henry Chaplin, the President of the Local Government Board. Its arrival at the Royal stables at Ascot Heath House, where the Prince has this week entertained a large party, naturally attracted much attention, and with the view of gleaningsome additional information, we journeyed down to Ascot on Wednesday evening last on Mr. Stanton's car, having one of the most pleasant runs we have so far enjoyed, and to which we hope to refer again next week. It is satisfactory to be able to record that the motor-car has been graciously received at the Royal stables, not one of those who have had charge of the Prince's horses for many years showing the slightest antipathy to the new-comer. They fully recognise the fact that the motor-car has come, and that the quicker horses and their drivers are taught to pay due respect to it on the road the better, in this respect setting an example which many drivers of horses would do well to quickly follow. When we arrived at Ascot on Wednesday we found the car in process of being washed down, after having conveyed its Royal owner for the first time that morning. The Prince of Wales, who was accompanied by the Duke of York, drove over to Cumberland Lodge, and although the trip only extended to about ten miles, he expressed himself as highly delighted with his experience. It will gratify those who have watched with interest the progressive development of the British automobile industry to learn that the Prince is well satisfied with his car, which is English built throughout. Seeing that such excellent and reliable vehicles can now be constructed in this country, he cannot understand why so many automobilists should show a preference for those of Continental manufacture. Certainly in this he is maintaining the traditions of the Royal Family, who since the example set by the late Prince Consort have done much to set the fashion in promoting the welfare of English trade and industry.

The first trip of the Prince in his own car was not without its amusing side. Seeing that the Prince's mechanic was unacquainted with the roads in and about Ascot, it was deemed advisable to send over to the Royal stables at Windsor for a groom to ride in front of the car. The Royal party duly set out with its pilot on horseback, but not a mile had been

traversed ere it was seen that the pace of the motor-car—although only on third speed—was proving too much for the horse and groom, and with a smile the Prince stopped the car, and considerably sent them home, remarking at the same time that the horse would need a little more fire in it before again attempting to set the pace for the motor-car.

At the completion of the Ascot festivities this week the car will be brought to Marlborough House, and it is not at all improbable that the Prince may be seen on his car at the Royal Agricultural Society's Show at York next week, this being his year of presidency of the society.

The position which the Prince occupies at the head of British Society, and the esteem in which he is held on the Continent, make his adhesion to the ranks of automobilists an event of the greatest importance, and should give an impetus not only to the industry, but also to the popularity of the motor-car as a pastime and sport. Whilst his accession cannot fail to have its effect on the automobile movement throughout Europe, its influence in the United Kingdom will of course be more immediately felt, and society people generally will naturally be less inclined to look

askance at the supersession of the horse by mechanical power. Probably the time is not distant when at festivities connected with automobilism, the toast of the Prince of Wales will be proposed as that of the Royal *chauffeur*, and who knows but that at the first dinner of the Automobile Club in the coming century—not so far ahead, by the way—the personal presence of the Royal motorist may set the seal of official favour on the once despised motor-car.

"PHANOMEN."

H.R.H. THE PRINCE OF WALES'S DAIMLER MAIL PHAETON.

Photo by

[Messrs. Curzon, Robey & Co.]

THE Endurance Motor Company, Ltd., Holbrooke's Lane, Coventry, have sent us a copy of their 1900 list, showing their two patterns of car and the motor which drives them.

A NORTH JERSEY automobile club has been organised at

Paterson, N.J. The club is formed with the same objects as the Automobile Club of America, but expects to make a special feature of weekly club runs.

A COMPANY has just been formed in Berlin with a capital of £12,500, to be known as the Dürr Motoren-gesellschaft, to acquire the patent rights in the Dürr impulse motor and to construct motors and motor-vehicles.

THE U.S. Consul at Leipzig reports that the automobile industry in Germany, though still in its infancy, is being rapidly developed, and before long is destined to become an important factor in the manufacturing circles of the country. The large amount of capital and energy which is being spent upon this branch of industry indicate that German business men have great confidence in the future of automobilism. Last year there were about 1,000 men employed in and around Berlin in the automobile industry, and to judge from the present outlook, this number will be more than doubled during the present year.

TOURING NOTES

BY A WORLDLING.

MY amiable *confrere* who writes on motor-car subjects for that young brilliant daily the *Express* over the pseudonym "Teuf-Teuf" tells us in all seriousness that Mr. Outhwaite's non-stop run of 221 miles "constitutes the longest known journey without a halt." An excellent performance without doubt, but it cannot in any way be considered as a record, as many a *chauffeur* has done better without thinking it worthy of being chronicled. It must have been *langweilich* work, too, as the average speed attained was only fourteen miles an hour. Mr. Outhwaite must have been very glad when it came to an end. Levegh, Charron, de Knyff, and a hundred others would soon make mincemeat of such records. Why I, *moi qui vous parle*, have done almost as well in an ordinary tour without thinking about it, but I must admit that I went a little faster.

Apropos I hear that Baron Arthur de Rothschild has just driven from Paris to Homburg in sixteen hours, and that he announces that he beat the "express" from Frankfort to Homburg by seven minutes—a boast which is singularly ridiculous to anyone who knows the pottering little *trambahn* as I do. I wonder if the Prince will take his Daimler there this year if, as has been announced in several places, he forsakes Marienbad for his old love Elizabethan-Brunnen. The surrounding country is a little too hilly for motor-cars, but it would be rather good fun if some keen *chauffeur* were to run a big car daily out to Nauheim. I commend the suggestion to Mr. Fred. Cook and Mr. Cumming Macdonald, who has already nibbled at automobilism; it would be an interesting departure for the Gee-gee Club. Most of the big hotels can find accommodation for cars, but I should strongly advise the Victoria, as the good Baehl once looked after a car for me very carefully at his other hotel, the Provence at Cannes. There can be no difficulty about petrol, as I know that Count Voss takes his Panhard there every year now, although when I was last at Homburg in '97 there was not an automobile in the place.

I DROVE down to Margate last week on an Orient Express, which behaved admirably, going fast on the level and climbing such terrifying hills as Shooter's and Chatham with three people and luggage on board without a grumble. Motor-cars are not popular there with the cabbies and drivers of *char-a-bancs*, who have a wonderful command of invective to hurl at the unfortunate *chauffeurs* who have come to spend money in their town. There are but two or three resident cars, the only one of which I saw bening a Benz, belonging to a Dr. Webb. I can thoroughly recommend the Royal York as the best hotel of the comfortable old English type, the New Inn Yard as an excellent *garage*, and Bentley and Co., of 31, High Street, for petrol.

ENGLISH *chauffeurs* who want to go over to France for the summer, and at the same time do not wish to go too far afield, could not do better than make Boulogne their headquarters, as the neighbouring country is well suited to short tours. Boulogne to Amiens, Berck, St. Omer, Béthune, and Calais are all good day's runs over excellent roads, and there are a thousand and one delightful little excursions in the more immediate neighbourhood. The 12 h.p. cars can run up to Paris for lunch and get their owners back in time to lose a good many hundreds at baccarat before midnight. The Imperial has a *garage*, but it is a very expensive hotel. I myself would rather go back to Paris and put my car up at one of the *remises* in the town; of these, Leveco's in the Rue Thiers is the best.

YOUNG Mr. Banner, the son of the English parson at Freiburg, in the Black Forest, is the chairman of the lately formed Breisgauer Automobil Club, which has already a considerable list of members. The little town in Baden is a most perfect turning centre, as every road which goes out of it is well laid, and leads to some interesting or beautiful place. I can imagine

no more delightful way of spending a holiday than by running down there *via* Dieppe, Paris, Strassburg, and then making excursions to Triberg, Donaueschingen, Badenweiler, Basle, Alt-Breisach, and even Baden-Baden, Karlsruhe, Mannheim, and Constanze. The best hotel in Freiburg is Sommer's, the "Zähringerhof," but there is a delightful little *garten-wirtschaft*, with comfortable rooms and a good kitchen, called the Hotel-Restaurant, Z. Kyburg, about two miles from the town in the Guntersthal, the first valley of the forest. It is splendidly placed in the shadow of a great pine-clad hill, with the great mountain road at its doors and an ice-cold stream running through the garden, in which there is an abundance of small trout for one to catch and have grilled for breakfast. I spent many happy days there before even petrol had added its perfume to that of its lilies and violets, but I hope that it will not be long before I hear the bass notes of my teuf-teuf sung back to me by some fair Echo who has lived since time began in the caves of the mighty Hochberg.

MR. HERBERT DE STERN has invited the members of the Automobile Club who are owners of motor-cars and friends accompanying them on their vehicles to a garden party at Strawberry Hill on the 10th July.

La Locomotion Automobile states that the Belgian Minister of War has placed an order with La Société des Automobiles Koch, of Paris, for a motor-car specially adapted for the transport of postal pigeons.

In a recent issue of *Cycling* Mr. G. Lacy Hillier had an article on his first trip by motor-tricycle. It provided excellent reading, and should be a warning to all who venture on new machines about which they know little or nothing.

THE daily papers report that at Preston Deanery, near Northampton, a motor-car was overturned on Sunday last, and, catching fire, was completely destroyed. The car was journeying from Derby to London, when one of the driving wheels skidded, causing the car to overturn.

It is reported that the Empire State Sugar Company, of Lyons, New York, has given an order to the General Carriage Company of New York for ten motor-trucks, each of five tons capacity, to be used for the cartage of sugar beets from the farms to the refinery. Mr. O. F. Thomas, the president of the concern, is also reported to have given an order for three electric omnibuses to run between Lyons and Soders Point on Lake Ontario.

THE *Municipal Journal* has been gleaning the opinions of a number of road surveyors regarding the suitability of macadam for road making. "What is your opinion of the use of macadam for the formation of main roads and business thoroughfares in a manufacturing town of 100,000 population?" was the question addressed to some sixty odd surveyors in various parts of England. The replies contain a strong objection to the material under any conditions, and a marked leaning is manifest to wood, asphalt, and granite setts.

DEALING WITH THE DOG NUISANCE.
(The Automobile Magazine)

TRIALS OF MOTOR-VEHICLES FOR HEAVY TRAFFIC.

UNDER the auspices of the Liverpool Self Propelled Traffic Association, a series of important trials of motor-vehicles for heavy traffic will take place in June, 1901. In our "Comments" we refer to the object of the trials and to the towns in which they will take place. Below we give the general regulations applicable to the vehicles and the rules and conditions of the competitions.

GENERAL REGULATIONS APPLICABLE TO ALL VEHICLES.

(I) The vehicle shall be self-propelled and self-contained. It shall be propelled by mechanical power alone, but there shall be no restriction on the source of such power or the nature of the agents used.

(II) The vehicle shall be capable of going anywhere that a horse-drawn vehicle carrying the same load is ordinarily required to go, and of being placed in the same positions and withdrawn therefrom without external assistance.

The particular manœuvre most generally called for is to work into and out of a loading berth when cramped for room. This requirement arises in the case of embayments, or of confined spaces between other vehicles in a line receiving or discharging goods. Carters usually back into such positions obliquely, and bring the vehicle into line by turning the leading wheels at right-angles to the rear wheels and again backing, but it is open to competitors to perform the manœuvre as they think best.

(III) The vehicle shall be capable of working into and out of an embayment of one-and-a-half times its own length.

(IV) The vehicle shall be capable of starting from rest on and mounting a gradient of one in nine (sets).

(V) The capacity of any water tanks, whether the same be fitted for feed, cooling or other purposes, shall suffice for a run of fifteen miles on the basis of the consumptions during the trial runs.

(VI) Such portion of the platform of the vehicle as is designed to carry the load shall be level, and the height of the floor-line, measured either when light or when laden, shall be not less than 3 feet 6 inches, and shall not exceed 4 feet 3 inches.

(VII) The vehicle shall conform in all respects to the requirements of the Locomotives on Highways Act, 1896, and, in the case of its being oil-propelled, of the "Regulations as to Petroleum" issued by the Home Secretary under Section 5 of this Act. In Class C, intended for vehicles for export to the Colonies and abroad, there is no tare limit, but the other regulations must be adhered to.

(VIII) All working parts shall be properly encased.

(IX) The boiler, tanks, oil-baths, and connecting-pipes shall be fitted with drain-plugs at their lowest points.

(X) The cross-section of any pipe connecting two tanks shall be not less than that of the pipe provided for filling the first tank of the two.

(XI) Provision shall be made to lock the compensating gear.

VEHICLES ELIGIBLE FOR COMPETITION.

Class.	Load.	Maximum Tare.	Minimum Level Platform Area.	Minimum of Driving Tires	Minimum width	Speed.
A	1½ tons.	2 tons.	45 sq. ft.	3 in.	8 m. pr hr.	
B	5 "	3 "	75 "	5 "	5 "	
C	5 " (minimum)	No limit.	95 "	6 "	5 "	

RULES AND CONDITIONS.

(I) The vehicle shall carry the weight of goods specified for its class, any excess weight in Class C being declared in advance by the competitor, throughout the continuance of the trials.

(II) Each competitor shall himself make all arrangements for the necessary staff and appliances to work his vehicle or vehicles. Accommodation for the vehicles, in Liverpool, Manchester, and Blackburn, will be provided by the Association. Vehicles intended for trial shall be registered as "arrived," at the Liverpool Depot, not later than noon on Friday, May 31st, 1901.

The association will arrange the supplies of water at intermediate depôts

(III) The Official Observers will accompany each vehicle during the trial runs to take notes of behaviour, fuel and water consumption, etc., and no repairs will be permitted without their knowledge and consent.

(IV) Any vehicle withdrawn from competition during the trials, except under the written authority of the judges, shall be ineligible for a prize or for commendation.

(V) Twenty half-plate photographs of each vehicle shall be furnished by the competitor, not later than May 16th, 1901.

These must be delivered in good order at the Liverpool Royal Institution, addressed to the Honorary Secretary, Liverpool Self-Propelled Traffic Association.

(VI) Entries shall be made on printed forms (to be obtained from the Honorary Secretary), and shall be

accompanied by an entry fee of ten guineas per vehicle.

Entries will be received under cover of a registered letter, by the Honorary Secretary, Liverpool Self-Propelled Traffic Association, the Royal Institution, Colquitt Street, Liverpool, any time prior to 12 noon on the last day of April, 1901.

(VII) A complete list of particulars, together with tracings or blue-prints of the general arrangement and principal parts, shall be lodged with the Honorary Secretary not later than May 16th, 1901, and further detailed drawings shall be submitted to the judges, in confidence, if required, while the trials are in progress or at their conclusion.

The description must be printed, and two hundred copies must be furnished. The particulars required are those enumerated in the section entitled "The Competing Vehicles" in the Report on the 1899 Trials.

(VIII) Each competitor shall arrange to have his vehicle or vehicles ready for inspection by the judges at 3 p.m. on the afternoon of Friday, May 31st, 1901, in the Liverpool Depot, when the dimensions, capacities, and weights will be taken by the Observers.

(IX) All vehicles shall be stored over-night at the depot or depôts provided by the Association.

FIG. 1.—GENERAL VIEW OF AUSTRIAN RACING CAR. (See opposite page.)

(X) At the conclusion of the trials, any vehicle, or motor, or part thereof, shall be opened up, in confidence, for inspection by the judges, if required.

(XI) Each vehicle will be allotted an official number, which shall be displayed during the continuance of the trials. Competitors must provide two boards or plates, each one foot square, with their number painted in black on white, the figures to be not less than eight inches deep, for attachment in the front and rear of their vehicle.

The judges reserve to themselves the right of absolutely disqualifying any competitor for any infraction of these rules.

Whilst obeying in all respects the instructions of the judges and the conditions of the competition generally, it is to be fully understood and agreed by every competitor that no responsibility, legal or otherwise, is to attach either to the judges or the Liverpool Self-Propelled Traffic Association, in respect of anything, or for any damage or injury caused to any person or thing, but that all responsibility of every sort and kind, whether pecuniary or otherwise, and all risk of damage to the competing vehicle, is to attach to the competitor, and is to be borne by him.

In making the awards, the judges—Mr. Everard R. Calthrop, C.E., M.I.M.E., Mr. S. B. Cottrell, M. Inst. C.E., M.I.M.E., Professor H. S. Hele-Shaw, F.R.S., LL.D., M.I.C.E., Professor Boverton Redwood, F.R.S.E., F.I.C., F.C.S., Sir David Salomons, Bart., M.A., A.M.I.C.E., and Mr. Henry H. West, M.I.C.E.—will consider the cost, control, working, and construction of the vehicles and the particular points in connection with those propelled by steam, oil, or electricity, respectively.

AN AUSTRIAN RACING CAR.

EARLY this year we illustrated and described the two-seated petroleum-spirit motor-car built by the Nessel-dorfer Wagenbau-Fabriks Gesellschaft of Nessel-dorf, Austria. We are now able to publish two illustrations of a racing car recently turned out by the same company. The car, which is said to be the first built in Austria specially for racing purpose, is thus referred to by the Nessel-dorf Company:—One of our cars competed this year for the first time in France and participated at the meeting at Nice. At the race of touring automobiles Nice-Dranguignan-Nice it secured the second prize, and at La Turbie (mountain) race the first prize. The car was especially adapted to Austrian roads and had a gauge of 1,150 mm.; that is about 200 mm. less than the French carriages. The car, as will be seen, has no resemblance whatever to a carriage, but is purely and simply a machine. It is double-seated, the driver's seat being elevated, while that for the mechanic is at the feet of the driver, this location being adopted in order to reduce the resistance to the air as much as possible. Steering is controlled by an inclined hand wheel, in front of which is the petrol-tank. A radiating coil is located in the fore part of the frame. Behind the driver's seat is placed the water-tank, the latter looking very much like the chimney of a locomotive. The motor has two horizontal cylinders, one

opposite the other; the cylinders have a diameter of 120 mm. and a stroke of 110 mm. The maximum number of revolutions is 1,300 per minute, which can be reduced to 100. The ignition is of the electro-magnetic type and is variable. Every part of the machine is readily accessible. On good level roads a speed of 92 kilometres (57½ miles) an hour, and on gradients of 12 per cent. 25 kilometres (15½ miles) an hour can be attained. The pneumatic tires of the rear hind-wheels have a thickness of 120 mm., and those of the front-wheels of 90 mm. The weight of the complete vehicle, including equipment, is 970 kilogrammes (about 19 cwt.).

THE first automobile exhibition ever held in Vienna was opened in the Prater on the 1st inst. No fewer than fifty-seven firms have sent exhibits.

THE Ceylon Rapid Transit Company, Limited, has been registered with a capital of £100, to construct, equip and work omnibuses, vans, carriages, boats and vehicles, whether drawn or propelled by animal power or by steam, oil, electricity or other mechanical power.

MOTOR WHEELS, Limited, is the title of a company which has been registered by Mr. A. S. Ramskill, 40, Holborn Viaduct, E.C., with a capital of £100 in £1 shares, to manufacture and deal in steam, oil, electric, and other motors, motor carriages and vehicles, bicycles, tricycles, velocipedes, etc. Registered without articles of association.

MR. M. CAPPELLEN, of the recently-formed Sports Motor Car Company, informs as that they are opening large and spacious premises at 103,

Fulham road, South Kensington, S.W., where the Mayfair voiturette recently illustrated in these columns will be on view. The new concern is making arrangements to carry a stock of petrol and also to store motor-cars for private owners as well as to carry out repairs of all kinds.

THE Locomobile Company of America are leaving no stone unturned to popularise their little steam cars. The company have just opened two storage stations in New York, where Locomobile vehicles may not only be stored, but where they will be cleaned, oiled, and kept in running order. A charge of 20 dols. per month entitles the customer to service at all the storage stations.

JOHN MARSTON'S Carriage Works, Limited, is the name of a company which has been registered with a capital of £75,000, to acquire the business of coach and carriage builders, etc., carried on by J. Marston, at 21 to 27, Bradford-street, Birmingham, as John Marston and Co.; and generally to carry on the businesses of coach and carriage builders and proprietors; and as manufacturers and dealers in electrical, steam, oil, gas and other motor-cars and vehicles, etc.

NEW laws have recently come into force in Switzerland to govern the operations of motor carriages. There are four regulations, as follows:—(1) Every motor-car must be tested by the authorities. (2) The driver has to be in possession of a legitimation. (3) Every motor-car must be fitted with two lamps, one with a white and the other with a green glass. (4) To every automobile must be affixed a plate bearing the name and address of the owner. It will be noticed that nothing is said in the regulations as to speed.

FIG. 2.—GENERAL SIDE VIEW OF AUSTRIAN RACING CAR.

CORRESPONDENCE.

THE CASE AT SKIPTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to correct an inaccuracy in the report which appeared in your paper of last week charging me with not giving "audible warning," causing two horses to bolt, and then running into a carriage. The true facts of the case are: the two horses which bolted were left on the highway unattended, and only ran about twenty yards, when they were stopped by two young men, doing no damage whatever. As for the carriage which was said to have been run into, it was not run into at all; it was approaching me from the front, and when within about ten yards of me the horse suddenly swerved round, causing the shaft to catch the hind wheel of the carriage to which it was attached, so I had nothing whatever to do with this. I might say that the driver never gave me any signal whatever, and the horse did not show any fear until it got nearly up to me, and as soon as I saw it I stopped my car. This accident occurred on the return journey, and was not at the same time as the horses bolting. The reason I did not appear was because I was away at the time, and it would have incurred further expense in travelling. I might say that I have had great experience, both in the shops and on the road, and I hold a driver's certificate. I obtained first honours and silver medal in 1900 for Benz cars, with the same car I was driving at the time of the alleged accident.

Hoping you will find space for this correction in your valuable paper, as inaccurate reports often make intending purchasers look on the dark side of motoring,

Yours truly,
TOM SCAIFE.

25, Winchester Mount, Hall Lane, Armley, Leeds.
June 10th, 1900.

[We would point out that our correspondent's correction applies to what transpired at the court; it does not affect the accuracy of our report.—Ed. *Motor-Car Journal*.]

THE PROPOSED MOTOR TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think your suggestion in the *Motor-Car Journal* of June 2 regarding a long-distance racing track for automobiles an excellent one in every respect. It is increasingly evident that the delights of speed on powerful cars are very attractive to owners of machines capable of such speeds as forty or fifty miles per hour. But our law prohibits anything above twelve miles per hour, so it is plain we must look in some new direction if we wish to use racing machines in this country. Such a direction is well indicated in your article, and I believe that both amateurs and members of the trade alike would welcome the erection of a course upon which something approaching to a "Derby on wheels" could be run. The objections raised by "Cautious Scot" in your issue of this week appear to me to be altogether beside the mark. He says the races at the Crystal Palace and the Automobile Club's tours should fill the want; but he appears to ignore the fact that a motor-car cannot race on the Crystal Palace track or, indeed, upon any other of that description, and, further, the club's tours are essentially "tours" and in no sense races.

Racing in France has undoubtedly produced the greatly improved car of to-day, and more racing will produce further improvements. I sincerely trust a suitable committee will be formed at once to deal practically with your suggestion.

Yours truly,
MARK MAYHEW.

The Automobile Club, June 11th, 1900.

SIR,—The question now being discussed in your columns in reference to the proposed motor track is one of especial interest to those of us who take such a keen interest in automobilism as

a sport. I notice that "A Cautious Scot" fears the sportive element being too closely identified with automobilism, on the ground that the professional element in racing would assuredly creep in. I am afraid in stating this he has formed his opinions on an entirely wrong basis. Motor-racing is entirely different to cycle-racing, and the question of expense is a very much more serious matter than is the case with the latter sport. The sportive element, in my opinion, is the element to be encouraged, and encouraged strongly.

What has up to the present formed the backbone of the growth of automobilism in this country? Why, the intensely keen enthusiasm of the amateurs who have taken automobilism up as a sport. From which section has the manufacturer derived the most benefit? Why, that section which has bought, and is buying, cars, in many cases very expensive cars, for the mere sport the owners will get out of the driving of them. The sport has made the industry in France and the sport is making the industry in England. The commercial side of the question has yet to develop.

And, now, granting all that I have said to be true, what would be more appreciated, what would be better supported, and what could be better conceived than a track specially designed for motor-car racing? In France the enthusiasm shown by the public has been unbounded in connection with the races there, and surely we in England are not behind our neighbours on the other side in appreciating a new sport, providing as it does the necessary dash and danger to make it fascinating both from a competitor's and onlooker's point of view. On such a track we could have our speed trials and time tests, and, in fact, do everything we wish to do and at present are prevented from doing in consequence of the "legal limit."

The manufacturer would also find a track of this description of very great assistance, and I am quite sure that the trade would most heartily support the idea.

By all means let us have a track, and let us have it soon.

Yours truly,
CHARLES JARROTT.

14, Regent Street, S.W.,
June 11th, 1900.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue a letter from a correspondent recommending the adoption of a motor-car racing course. There is no question in my mind that nothing would do so much to improve English manufacture as the adoption of this idea. Racing brings out the worst or the best points of every car, and a car which can travel fast and far without trouble can be adapted for every other purpose.

One may take it as a good rule that immediately the manufacturer of a large carriage suggests that his car is good for touring but bad for racing, it is practically admitting that it is badly designed, and it is only good enough for using on runs where one has time to get off and do repairs. Once this is more generally recognised so quickly will English motor-vehicles forge rapidly ahead.

Yours truly,
S. F. EDGE.

14, Regent Street, London, S.W.,
June 12th, 1900.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with "A Cautious Scot" that a motor track would possibly lead to the decadence of the industry. We do not want the sporting man to get hold of the motor and ruin the trade in the way he has the bicycle, and it behoves a sharp look-out to be kept on the pot hunters, for, owing to the lack of interest in cycle races, there must be a large army of racing men and pacers standing idle, and would not care what harm they did to the trade so long as they could add a few more cups, marble clocks, etc., to their store.

I trust our influential journals will lose no opportunities to endeavour to keep the pastime free from the taint of racing. I really think that if the Act of Parliament had forbidden any car

to be geared to more than the regulation speed on a level track, the trade would have profited thereby, the cars would have been more serviceable, better hill climbers, and in every way more suitable for their purpose. I think that if one can do a journey of, say, fifty miles at the rate of eleven miles per hour they should be satisfied. No horse could do it, and no horse owner would think of such a speed, but directly he gets on a car nothing under twenty or twenty-five miles per hour is thought of. I don't want you, sir, to think I am conservative in the matter, but what is the use of cars speeded up to forty miles when the law only allows fourteen?

London, June 9th, 1900.

Yours truly,

W. T. W.

TROUBLE WITH A BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re your note "experiences wanted" in "Comments" of this day's issue of the *Motor-Car Journal*, can any of your readers help in the following curious trouble? I have an English-made Benz with everything useful up to date, and for some time I have been regulating my speed by the advance ignition lever, not using the throttle valve lever at all, but lately I have found I could not slow down my engine. Indeed, in my attempts to locate the trouble, I have quite shut off the sparking, and have travelled nearly a mile still getting regular firing in the cylinder. It is positively nothing to do with the electricity, as I well understand that part of the car.

June 9th, 1900.

Yours truly,

FOG.

MOTOR-TRICYCLE EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps some of my experiences with a motor-tricycle may be interesting to your readers.

My chief trouble has been with dry batteries, which I have replaced with woven glass accumulators. I have had two dry batteries this spring, and neither of them ran the tricycle more than a few miles. The trouble was probably not due to any defect in the dry batteries, but may have been caused by short circuits running these batteries out; but the reason I have discarded them is that they partially recover themselves, and you cannot tell for certain that it is the battery at fault, as after a good deal of coaxing, pedalling, and manipulation of the various levers the motor suddenly goes off all right, and you take the tricycle out only to get stranded about five miles from anywhere. Another thing in favour of accumulators is that if you run them out through short circuiting, you can get them re-charged for 6d., while with a dry battery you lose £1 or so. I think it a great mistake to put a battery of any kind in a tin case, as with the vibration one gets on a tricycle some part of the battery or communicating wires are sure to come in contact with the case, and away goes all your electricity. When I had a dry battery I nearly wore three or four sparking plugs out. Since using accumulators I have never had occasion to touch the sparking plug.

A very good way of preventing leakage of electricity is to thoroughly insulate the wire from coil to sparking plug by enclosing it in a piece of $\frac{3}{8}$ in. rubber gas tubing. The current through this wire is of very high voltage, and will go through almost anything. I have distinctly felt shocks on touching the ordinary insulation.

I have cured "oil on contact breaker" troubles by winding a piece of string round the half-speed shaft between the cam and ebonite; this prevents the oil that comes through from splashing on to the trembler.

I went for a trip to London and back a fortnight ago, and only had two little stops in addition to getting "stuck" on a steep hill through getting the mixture wrong. The first happened near Longfield. I was going at a great speed when the motor suddenly stopped firing, and the tricycle ran quite easily and with no compression; on dismounting I found the exhaust valve stuck up. I soon got it down again, and arrived in town without any further trouble. On returning I stopped on Wandsworth

Common to put some oil in motor case, and started off again without screwing on the cap in brass tank. I discovered this when I reached round to let some more petrol in. I expected trouble, and sure enough the motor stopped two-thirds of the way up Chislehurst Hill. I dismounted, and found that the oil had splashed all over the side of the motor, so I carefully cleaned the trembler and tried to start, but the motor would not fire. The only other place where the oil could have done damage was the sparking plug, so I took the wire out and carefully cleaned it, and on replacing it the motor brought me home in fine style. Have any of your readers had any experience with the Simms magneto ignition? I very much enjoyed reading your account of the 1,000-Miles Trial.

Herne Bay, June 9th, 1900.

Yours faithfully,

CYRIL SCOTT.

THE 1,000-MILES TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—At a meeting of the Judges' Committee which was held on the 11th instant I was directed to request that you would be so good as to announce through the medium of your columns that the attention of the Judges' Committee has been called to certain advertisements and statements concerning vehicles entered for or running in the 1,000-miles Trial.

The Judges wish to warn the public against accepting any such statements until their Report, upon the compilation of which they are now actively engaged, has been published.

The Automobile Club,

4, Whitehall Court, London, S.W.

12th June, 1900.

Yours truly,

C. JOHNSON,

Secretary.

THE DANGER OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On May 16th last a Star motor-car belonging to our firm on returning from a journey was put away in the show-room, having a slight leakage from the gauge glass in the petrol tank. It was considered safer to draw out the petrol from the tank than to leave it, and while so doing the spirit vapour caught fire and exploded from the Dietz carriage lamps fitted on the front of the car. Without any possible chance of saving the show-room, not only was the show-room burnt out, but the adjoining residence and engineers' stores were also completely destroyed, doing damage to the extent of over £1,000.

We write this so that your influential journal may warn users of petroleum spirit of the dangers in using it, in order that great care may be used. This is an expensively bought piece of experience for us.

Yours truly,

RICHARD DRAKE.

(Richard Drake and Sons, Ltd.)

High Street, Sutton, Isle of Ely, June 9th, 1900.

CHANGE-SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. R. A. Cobb's query in your issue of 9th inst., he is quite correct in assuming that the gears in the De Dion voiturette are always in mesh, and that they are thrown in or out of work by clutches. The two clutches consist of two expanding segments each, with flat frictional surfaces, and expand away from shaft, and do not, as in usual practice, slide along the intermediate or driving shaft. They seem to me to be most certain and effective in practice.

Yours truly,

Lea House, Brondesbury, N.W.

June 11th, 1900.

G. D. BARNES.

[Owing to the pressure on our space this week several letters have had to be held over.—Ed. M.-C. J.]

COMPRISED in the Leeds hospital sports, which are fixed for August 7th next, are two motor-cycle handicaps.

THE agency for the New Orleans voiturette in the district has been secured by the Bristol Motor Company, of Red Cross Street, Bristol.

MOTOR-CARS ON THE CONTINENT.

Fire!

It is somewhat difficult to account for an outburst of fire on board a motor-cycle, especially during the cool of the evening, but such an incident occurred on Monday night last in the Champs Elysées, and the owner of the machine was sadly perplexed as to how he was to extinguish the flames. Fortunately for him, however, a passer-by had the brilliant inspiration of running across to the Jardin de Paris, where a fire-extincter was readily obtained, and the flames put out without trouble. I have had a similar experience of fire upon a motor-cycle, but in my case it resulted from the continuous exposure of the machine to the scorching rays of a summer sun, and it was preceded by the explosion of the carburettor. The simple remedy of a cap pushed well into the hole formed in the carburettor by the explosion was luckily sufficient to smother the flames, but since then I have always deemed it wiser to leave my machine in the shade whenever the sun has been at all powerful.

The Fêtes of the A.C.F.

FOR a long time past we have been daily expecting to hear some news as to the date upon which the theatre of the Automobile Club de France would throw open its doors, and now we are in possession of exact information upon the subject. The 9th and 10th July will witness the initial performances in this sumptuous theatre, and the occasion will be the two fêtes given in honour of the Exhibition and the various Commissioners General. The idea at present is to give two soirées, repeating on the second evening the same programme as on the first. Many of the leading artists in Paris will participate, and a *revue* has been specially written by M. Pierre Giffard for the occasion. The first soirée will be reserved to members of the Club and their friends, while invitations will be issued to the Ministers and several public officials, the Commissioners General, the various Prefects, and other notabilities. The relatives of members of the Club will be invited to the second soirée, and it is generally anticipated that these fêtes will be brilliant in the extreme. No doubt complete details will be issued in due course, and they are being awaited with interest.

M. Leon Bollee.

ENGLISH automobilists will learn with particular satisfaction of the nomination of M. Léon Bollée to be Chevalier of the Légion d'honneur, for was not Monsieur Bollée one of the very first to initiate us in the mysteries of automobilism? Personally I retain, and always shall retain, a very vivid recollection of the arrival of the Chevalier, with his curious low-lying machine, in London, and what a sensation the latter made in the streets. Some time afterwards, on the morning of the famous ride to Brighton, M. Bollée gave us a demonstration of his driving powers in the old Central Hall, Holborn, where the cars were housed previous to setting out upon their expedition to London-by-the-Sea, and the manner in which he dodged in and out among the vehicles, oil cans, tool boxes, and other encumbrances was a revelation to our extremely limited experience in automobile matters. M. Bollée is a member of a family singularly gifted with inventive genius, and it may be news to motorists that his efforts are not by any means confined to automobiles, and that he is well known as the inventor of a very wonderful calculating machine. Since the commencement of the motor movement in France, M. Bollée has taken an active part in its development, and his name will always be inseparably connected with these early efforts. He has competed, too, in many courses, including the historical race Paris-Bordeaux-Paris, which was won by M. Levassor, and in several of them has achieved capital performances.

Paris-Brest Race.

To the great regret of French automobilists the directors of *Le Matin* have decided to abandon the race from Paris to Brest and back, which it had been intended to organise for July 5th and 6th. It is indeed a pity, for the excellent arrangements made in "Le Tour de France" fully warranted automobilists' expectations that the Paris-Brest event under the same management would be one of the best organised races of the year. Whether the directors of this Parisian daily do not care to burden themselves with the great responsibilities of an automobile race, or whether the necessary authorisation is more difficult to obtain than we have of late been led to suppose, is, for the moment, not quite clear, but anyhow the race is off. Apart from the question of authorisation there is no doubt but that the organisation of a big motor race is no light undertaking, and especially so in the case of the busy staff of a daily paper—and then, too, there is the responsibility. No, I am not surprised at the decision of *Le Matin's* directors, but regret it none the less.

Motor Boats.

AN international competition for motor boats will take place on Wednesday and Thursday, the 23rd and 24th inst., on the Seine, at Argenteuil, when a number of small launches are expected to display their power. Were not motor constructors so busily occupied with automobile work, there is but little doubt that the motor boat would make much more headway than it is at present doing, for its advantages over the steam launch are many and important. The fitting, too, is not difficult, for there is no constant road vibration to contend with, and the work is remunerative. Possibly the approaching regatta may give a fillip to this branch of motor work, and the Hélice Club, under whose direction the races will be contested, are to be congratulated upon their movement.

The Victims of the Automobile War.

FROM a series of figures appearing in a recent issue of *Le Vélo* it appears that from April 29th last, the day upon which the war against Parisian automobilists commenced, until May 31st, no fewer than 140 *chauffeurs* have made their appearance in court charged with some infringement of their country's laws and that among these poor trembling victims of the over-zealousness of the police no less than eighty days of imprisonment have been meted out, not to mention a whole crowd of fines and minor penalties. I really do not wonder that automobilists are fined for not possessing a *permis de conduire*, for the delay in obtaining it, in Paris, is so dreadful that one becomes impatient and chafes at it. I know men who have sent in their applications more than one month ago, and who live in a state of anxious expectation awaiting the call that never comes. Let me strongly recommend English tourists coming into France to enter by way of Havre and obtain the necessary *permis* there, for it can be secured with but very little delay. Only don't forget the two unmounted photographs, and don't forget to make written application on *papier timbré à 60 centimes*. If there is any difficulty or uncertainty as to what to do a visit to M. Tourand at his *garage*, 31, rue Dicquemare, would probably be productive of good results, for M. Tourand is always willing to help a *chauffeur* in distress.

At Périgueux and at Draguignan.

ALTHOUGH the weather for the Bordeaux-Périgueux-Bordeaux race was not remarkable for its fineness the competitors had no serious complaint to make, and it was those automobilists who were more particularly interested in the exhibition and gymkhana at Périgueux who were really unfortunate. The *concours d'élégance* was rained upon and so were all the other festivities. The winners of the beauty prizes were:—Cars which had competed in race: 1, Lafitte; 2, Maurel; 3, Valton. Non-competing cars: 1, Comte de Fayolles; 2, Schroder. Voitur-

ettes: 1, Legendre; 2, Briol; 3, Chrétien. Upon the conclusion of the meeting several of the southern *chauffeurs* went on to Draguignan, where there was decided, on the 4th instant, a race over 182 kilomètres of route. This event was organised by the Automobile Club Dracenois, and the course followed was from Draguignan to Aix and return. Despite the rain, which fell incessantly, fair times were recorded, the official return being as follows:—Motor-cycles: 1, Vitalis, 5 h. 4 min. 25 sec.; 2, Allègre, 6 h. 34 min. Cars, 1st series: 1, Gondoin, 7 h. 30 min. 15 sec.; 2nd series: 1, Stead, 5 h. 20 min. 37 sec.

Commercial Travelling on an Automobile.

THE advantages of the automobile for business purposes were strikingly demonstrated some short time ago by the arrival in Paris of the traveller of a certain German firm trading in fancy goods. This gentleman left Berlin at five o'clock in the afternoon of May 27, and, travelling by way of Magdeburg, Brunswick, Hanover, and Cologne, he reached Aix-le-Chapelle, where he stayed a couple of days. From Aix he proceeded to Liège, where his duties kept him employed for two days, and then he came on to Paris *via* Namur, Givet, and Rheims, the distance covered being 1,145 kilomètres. Entirely independent of the railway he was able to suit his own convenience, and lost no valuable time in waiting for overdue trains, with the natural result that the actual amount of work performed greatly exceeded that which on previous occasions he had been able to carry out in a similar length of time.

Criterion des Electriques.

ON Monday next, the 18th inst., the directors of the well-known paper, *Le Sport Universel Illustré*, will hold their second annual competition for electric vehicles, and, as last year, this *Critérium* will have two distinct features. First of all there will be a race over the following course:—Porte Maillot, Avenue de Neuilly, Quai de la Jatte, Le Pont Bineau, La Garenne-Charlebourg, Bezons, Houilles, Maisons-Lafitte, La Croix-de-Neuilles, Poissy, Triel, Meulan, Poissy, Saint-Germain, Le Pont du Pecq, Le Vésinet, Chatou, Rueil, Suresnes, Saint-Cloud, Chalets du Cycle, and then the competing cars will be required to drive round and round Longchamps until their electric power is entirely exhausted. Three categories are provided, these being:—

1. Cars weighing 1,200 kilogrammes and upwards.
2. Cars weighing from 800 to 1,200 kilogrammes.
3. Cars weighing less than 800 kilogrammes.

All types of electrically-propelled vehicles are thus catered for. The start will be effected at nine o'clock in the morning, and after the finish a banquet will be given at the Chalets du Cycle.

The Exhibition Competitions.

THE date originally selected for the cab competition was June 18th to June 23rd, but automobile events have suffered many changes and alterations this year, and the *Concours de Fiâcles* is no exception to the rule. It has been found necessary to defer the holding of this contest until August 6th, and the trials will extend over a period of six days, that is to say until August 11th. Entries must be made to M. Jeantaud, 51, Rue de Ponthieu, Paris, on or before August 1st. The fee is £4. From Monday next until Saturday the 23rd instant there will be held the motor-cycle trials, the awards being made upon the following basis:—1. The consumption of fuel or power; 2. The running of the motor; 3. The endurance of the machine. This event should give an opportunity to those manufacturing firms who do not construct racing machines, and who are consequently rather overlooked by the public. May it bring them good business!

THE *Globe* is among the London daily papers which have noticed the suggestion made in these columns for a five mile motor-racing track.

THE ROMAIN PETROLEUM-SPIRIT MOTOR.

THE Delaugère motor-tricycles, one of which is comprised in the automobile stud of Mr. Mark Mayhew, recently illustrated in these columns, is fitted with a motor known as the "Romain." The engine is made in several sizes, including one of 2 h.p. and one of 3 h.p. The sectional illustration given herewith shows the 2 h.p. motor. The cylinder is of the air-cooled type, radiating fins being also fitted to the exterior of the explosion and valve chambers. The cylinder has a bore of 82 mm., the stroke being 80 h.p. As will be seen, the piston rod

is connected to two crank discs, forming fly-wheels working inside an oil-containing case of partinium, the bearings being of manganophosphor-bronze. The valves are arranged one at each side of the cylinder; the inlet valve is made of one piece of steel, while the exhaust valve has a cast iron body and a steel stem. The normal speed of the motor is 1,300 revolutions per minute, but by means of the variable electrical ignition this can be varied between 400 and 1,700 revolutions.

UNDER the conduct of Mr. Whitney Lyon, the Automobile Club of America recently had a run, by invitation of the Turf and Field Club, to the races at Morris Park, New York.

OWING to the withdrawal of the support of the Bavarian Automobile Club, the Austrian Club has abandoned the projected Munich-Vienna race.

WHEN at Messrs. Friswell's Automobile Palace on Holborn Viaduct the other day we were shown a new type of "Argyle" voiturette. The car is fitted with a 2½-h.p. De Dion motor, having a water-cooled combustion chamber and a Clarkson-Capel cooling coil. The little vehicle is fitted with a variable gear giving three speeds forward and reverse motion, the transmission being similar to that adopted in the Renault cars.

THE GORDON-BENNETT CUP RACE.

(From our Own Correspondent.)

BY the time that these lines are in print the first Gordon-Bennett international cup race will have been run and won. Up to the last moment it was extremely uncertain whether the event could be brought off on the selected date, and for several reasons. First of all, the necessary authorisation was not received from the Minister of the Interior until Saturday morning, and although the Sports Committee of the Automobile Club had in the meantime been steadily completing the arrangements there were a hundred and one details which could not possibly be attended to until the official permission for the race was actually in the hands of the organisers. When one considers that the route had to be labelled from end to end to prevent any possibility of the competitors going astray; that the mayors of all the towns traversed *en route* had to be posted with the final details, and that the usual number of official red-tapeisms had to be complied with, it is obvious that the five days between the receipt of the authorisation and the date selected for the race did not allow of any too much time. But the Sports Committee buckled to its work and early in the week it was seen that the event could be decided. Then the Belgian team took exception on the ground that due notice had not been given to them, and on Monday afternoon I received a communication to the effect that it had been found necessary to postpone the *course*. On Tuesday afternoon a meeting of the delegates was held at the Club, those present being: Comte de Chasseloup-Laubat (France), M. Ruys Orban (Belgium), Mr. Dinsmore (United States), and Count Sierstorpf (Germany), with M. René de Knyff and Mr. Winton in attendance.

The opinion of Mr. Winton was entirely favourable to the race being run upon the originally selected date, and this it was eventually decided to do, the exact time and place selected for the start being three a.m. on the morning of the 14th instant, at the level crossing of Montretout on the Versailles road between Saint Cloud and Ville d'Avray. Whether under these circumstances the Belgian contingent will compete I cannot at the time of writing definitely say, but should they not do so the race will undoubtedly lose much of its interest, for to my mind they are the only competitors likely to really extend the French trio. The members of the Belgian team are MM. Caters, Jenatzy, and Lefebvre, and their mounts are 30-h.p. Bolide cars, which have already an excellent reputation for fast travelling. All the competitors have, I believe, gone over the route; indeed, a thorough knowledge of the road is absolutely essential. Mr. Winton, the American representative, made a careful examination of it from end to end, and his assistant, Mr. Collings, has run a couple of trips right through, in addition to an occasional drive or so over some particular portion. A great race may be anticipated, but I shall be astonished if any of the visitors succeed in wresting the cup from the keeping of the A.C.F. We shall see, however.

On Thursday morning we received a telegram (despatched at 8.14 a.m.) from our correspondent, who was then at Orleans, to say that five competitors had passed through the town, the order being as follows:—

1. Girardot.
2. Charron.
3. Knyff.
4. Jenatzy.
5. Winton.

Just as we go to press we have received another telegram from our correspondent giving the result of the race. The winner is M. Charron, who arrived first at 12.23 p.m., having completed the journey at an average speed of sixty-two kilometres per hour.

MR. H. J. LAWSON has purchased the cycle factory in Coventry recently occupied by Starley Bros. Ltd. This is a good sized factory and eminently suited for motor work.

THE ENGLISH MOTOR-CAR CLUB.

AT a meeting held at the Holborn Viaduct Hotel on Wednesday inst., the 13th inst., a new motor-car club was formed for the whole of England, which will be known as the "English Motor-Car Club." Amongst the well-known motorists present at the meeting and who afterwards joined the new club were Messrs A. J. Wilson, F. F. Wellington, W. Munn, E. W. Hart, S. F. Edge, F. W. Baily, G. H. Smith, C. Jarrott, and several others. In addition, many of those present had names of gentlemen whom they knew would join immediately on the formation of the Club. To show the hopeful spirit prevailing, we might mention that several of the new members immediately paid the annual subscription for five years in advance, the annual subscription being for town members £1 1s. and for honorary members 10s. 6d. It will thus be seen that the club starts, not only with a membership, but also with funds in hand. The hon. secretary and treasurer is Mr. F. W. Baily, and a committee was elected, with power to add to its number as new members come forward.

Headquarters for the new club are being arranged at the Crystal Palace, but at the present, gentlemen or ladies who desire to join the new club should communicate with the hon. secretary, Mr. F. W. Baily, at his private address, 94, Oakfield Road, Auerley, S.E.

THE ROOF GARDEN AT THE FRENCH AUTOMOBILE CLUB IN PARIS.
(Cliché de) [La Nature.]

The new club starts immediately with an active programme. The first big event will be an open hill-climbing contest at Tilburstow Hill, near Godstone Green, in Surrey, on the first Saturday in July, starting at about four o'clock in the afternoon. This will be, we are informed, a completely novel competition, inasmuch that the scheme is being so arranged that results will be judged by the efficiency shown as relating to the price of the car and the weight in passengers it carries up the hill. The entrance fee for this event will be 10s. each for the cars, and for tricycles and quads, 5s. each. Intending competitors should communicate at once to the hon. secretary at the above address, as the time is short.

On the last Saturday in July there will be a control contest at the Crystal Palace. The leading feature of the new club will be club runs on Saturdays and week ends. It is thought that this will meet a long-felt want.

THE Automobile Club of America has now no fewer than 232 members, of whom 140 own motor-cars.

A LARGE building in Hope Crescent, Edinburgh, known as The Edinburgh Cycling Academy, has just been purchased by Mr. R. D. Leslie, advocate, for an Aberdeen client. It is to be used for the exhibition and trial of motor-cars.

														onsteepportion			[pedalling.]

* One out temporarily. † Assisted with pedals. ‡ Had to dismount. § Passenger alighted for 100 yards. ** Passenger alighted and driver pedalled over last portion. *** Both alighted and pushed at finish.

CALCULATION OF AVERAGES.—In calculating the average speeds, no speeds in excess of the legal limits are recorded, and it is assumed that a vehicle is capable of travelling over the controlled portions of the road at the same speed that it makes on the uncontrolled portion. For instance, if a car covers 44 miles in four hours, of which eight miles have been through control districts at 8 m.p.h., the average speed over the whole distance will be calculated as 12 m.p.h. The averages do not include time occupied by compulsory stops for meals, but every other stop for repairs, replenishing oil, or for any other cause whatever is included in running time.

SPEED TRIALS.—By permission of the Duke of Portland, a trial of speed was allowed on one of the private roads at Welbeck, on Friday, May 11th. The times were taken over one mile of slight ascent and one mile of slight descent, and the average time occupied per mile were as follows:—Hon. C. S. Rolls' 12 h.p. Panhard, 1min. 35½sec.=37.63 m.p.h.; Mr. Kennard's Napier, 2min. 1½sec.=29.30 m.p.h.; Mr. Mark Mayhew's 8 h.p. Panhard, 2min. 1½sec.=29.60 m.p.h.; Ariel Tricycle with Whippet Trailer, 2min. 2½sec.=29.45 m.p.h.; Mr. Holder's 12 h.p. Daimler, 2min. 17½sec.=26.23 m.p.h.; Hon. John Scott Montagu's 12 h.p. Daimler, 2min. 18sec.=26.08 m.p.h.; Century Tandem, 2min. 29½sec.=24.09 m.p.h.; Gladiator Voiturette, 2min. 35sec.=23.16 m.p.h.; Mr. W. Exe's 6 h.p. Panhard, 2min. 49½sec.=21.27 m.p.h.; Mr. Butler's 6 h.p. Panhard, 2min. 49½sec.=21.27 m.p.h.; De Dion Voiturette, 3min. 5sec.=19.45 m.p.h.

THE DAIMLER MOTOR COMPANY'S CATALOGUE.

THE new catalogue issued by the Daimler Motor Company, Limited, is an excellent one in every way: the printing is good, the letterpress capital, the arrangement clear, and the information accurate and reliable. When the next edition is issued it should be provided with an index, and then something approaching perfection can be inscribed on its cover.

One of the first and most important sections of the work is devoted to a description of the Daimler motor recently fully explained in our columns, and then follow readable chapters on pressure and gravity feed motors and the Daimler frame and transmission gear, both being illustrated in a very clear style. The list of awards and medals obtained by the Daimler Company extends to three or four pages, and a brief selection is also made from the many splendid testimonials which have been given the company's vehicles. Specifications of the frames, a price list of parts, and similar particulars useful to every intending motorist or actual automobilist, complete the first part of a catalogue the publication of which evidences considerable enterprise and should lead to extended business.

Nearly twenty pages are filled with matters of general interest to all concerned with motor-vehicles, and, apart from the nature of the first portion of the book, will give it a permanent value, including as they do legal information, the carriage and storage of petrol, railway regulations, clubs and associations in connection with the automobile movement, lighting up and speed tables, and other useful memoranda. Altogether the catalogue is worthy of the position attained by the Daimler Co. in the British automobile industry--and that is saying a great deal.

FURIOUS DRIVING CASE.

AT Eastbourne Borough Bench, before Mr. A. Mayhew and other Magistrates, Herbert Miller, of 11, Willowfield Road, and Arthur Allday, of 30, Beltring Road, licensed motor-car drivers, were summoned for furiously driving motor-cars on June 5th. Mr. H. West Fovargue (Town Clerk) prosecuted, and Mr. Lawson Lewis defended.

Detective-Sergeant Ransom stated that he was in Seaside Road at eleven a.m. on the day mentioned, and he saw defendants driving two motor-cars in the direction of Seaside. Allday was in front, on the right side of the road, and Miller, who was behind, on the wrong side, was apparently trying to pass the other car. In his opinion they were racing, and going about twelve miles an hour. He did not try to stop them, as they were going too fast. When they returned, he did not charge them with driving at a faster rate than five miles an hour; he simply told them that they were driving furiously and to the danger of the public.

P.C. Laurence, George Ridley, a cabman, and Joseph Whatford, another cabman, gave similar evidence.

Allday said he was a certified motor-car driver, and he had eight passengers upon the occasion mentioned. They were going from six to seven and a half miles an hour. He could swear positively as to the speed, because there was an indicator on the car, and the extreme pace at which he travelled was seven and a half miles. There was very little traffic in the road, and he could pull up his car in three yards. Miller was not trying to pass him, as he had orders from Mr. Jury to follow him all the way to Perensay. He increased the speed from six to seven miles opposite the Pier Hotel, because he had been in the habit of driving at that rate, and had never before been stopped.

Miller gave similar evidence, and William John Endersby, of 53, Seaside Road, gave corroborative evidence, mentioning that he was an engineer, and was competent to judge the pace of a motor-car. In answer to the chairman, he said it would not be dangerous to drive motor-cars in the town at the rate of nine miles an hour, as they could be pulled up in a yard. Mr. Lawson Lewis, in addressing the Bench for the defence, said that Mr. Jury, the owner of the cars, was anxious to conform with any reasonable regulations made by the Watch Committee, and had instructed the drivers to use every care and precaution. He also contended that the complaint was made that the men were driving over the rate of five miles an hour—a regulation which the Watch Committee proposed. He contended that that would be a most unreasonable regulation for the borough of Eastbourne, and there was not even such a regulation in the City of London, where they could every day see motor-cars going at seven and eight and even nine miles an hour.

After consultation the chairman said the public appreciated motor-cars, and the Bench had no desire to put unreasonable restrictions on them, but they had every desire to see that they were run with absolute safety to the public. Putting the speed at the lowest rate mentioned, the magistrates considered that they ought to convict. They usually dealt severely with cases of furious driving, but the magistrates did not

consider that it was an aggravated case, and they would only impose a fine of £2 each and costs, and allow defendants a month to pay the money.

A NON-DELIVERY ACTION SETTLED.

IN the Court of Session on the 9th inst., Lord Stormonth Darling was informed of a settlement in the action by Mr. Thomas Walker against the Madelvic Motor-Carriage Company, Ltd., Edinburgh, concluding for payment of £50 and £300. The pursuer, who is a master baker, ordered an electric brake from the defenders, the price agreed upon being £400, and he stated that though £50 had been paid the vehicle had not been delivered. The action has been settled by the pursuer accepting an offer of the liquidators of the Madelvic Company to rank him for £200, with expenses in the liquidation.

ACTIONS OVER MOTOR-TRICYCLES.

At Coventry County Court, on Tuesday, the receiver of the Beeston Motor Company, Limited, sued Messrs. Clarke and Company, of Doncaster, for £60 ls. 6d., the price of a motor-tricycle. A counter-claim was set up, and £35 indebtedness was admitted. An agreement was come to by which the Beeston Company got a verdict for £25 in addition to the £35, and the defendants were allowed a set-off of £10 10s., costs according to rule.

At Epsom County Court on Friday, the 8th inst., before his Honour Judge Lushington, Q.C., Clifford Potier, motor agent, Sutton, sued W. J. Gibbons, motor agent, Belmont, for damages for non-delivery of a motor-tricycle. Plaintiff stated that he gave the order for a tricycle on March 3rd, subject to its being delivered in ten days at the latest. He had, however, not received it yet. With a view to advertising the cycle he had prepared a catalogue, and placed a view of the one in question on the front page. He had a stand at the Motor Car Exhibition in April, and in consequence of the non-delivery of the machine there was a vacant space. He agreed to pay £45 for the machine, and paid a deposit of £15. Defendant said he had not delivered the machine in consequence of the difficulty in getting it from a firm in France. It was now being enamelled in London. His Honour gave judgment for the plaintiff for £10, in addition to the £15 deposit.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, JUNE 23, 1900.

[No. 68]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ALTHOUGH the progress with the adoption of motor-vehicles in England is not so rapid as many interested in the movement would wish, yet the number of cars to be seen running about in the public streets of our large cities is slowly but surely increasing, and hardly a trip can be taken in the country without meeting one or more automobiles. It would have been an instructive lesson to many who are continually asking "Where are

the motors?" to have been with us in Regent Street the other morning, when no less than six horseless vehicles ran by in as many minutes. The first that attracted our attention was a De Dion voiturette, after which Sir David Salomons came along on his Peugeot car. The next one was an electric dog-cart, and then Mr. Still appeared on his Canadian three-wheel electrical voiturette, which figured at the recent exhibition at the Agricultural Hall. Number five was one of the large petroleum-spirit motor-omnibuses which are now running from Kennington to Oxford Circus, while Messrs. W. H. Smith and Son's Lifu steam van made up the half-dozen. Yes, the motor-car is becoming a more and more familiar sight.

1,000-Mile Trial Protests.

THE club committee of the Automobile Club, in regard to protests made in connection with two vehicles run in the 1,000-Mile trial, have arrived at the following decisions:—The first was a protest made against "A 10," the 8 h.p. Napier entered by Mr. Edward Kennard in the Private Owners' Section. The ground for the protest was that the car was driven by a gentleman financially interested in its manufacture—Mr. S. F. Edge—and that although this might not be against the letter of the definition of the "Private Owners' Section," it was certainly against the spirit of it. The committee decided that as the protest was not lodged within the time specified in the rules, the matter could not be entered into, but they considered that the intention of the committee was that the rules should not allow manufacturers to drive in the Private Owners' Class, and that, in future competitions, the rules should be altered to make this clear. The second protest was against the tricycle entered by the Motor Manufacturing Company, on the ground that the tricycle which was running at the finish of the 1,000-Mile Trial was not the tricycle which started at the commencement of the Trial. The Motor Manufacturing Company had reported, during the earlier half of the Trial, that in consequence of damage having occurred to the framework of the machine they had substituted a new frame and wheels, and they subsequently reported that, owing to an accident to the motor, a new motor had been substituted prior to the last day of the Trial. As a result of the protest the Motor Manufacturing Company have withdrawn the tricycle from the competition.

Motor Meet in Ireland.

KILLALOE was much before the public a few years ago in connection with a popular song, but, of late years, it has fallen into obscurity. The fact that the first organised motor meet in Ireland is to be held there on July 14th should do something to revive its publicity. Already we believe the owners of a dozen motor-cars have promised to participate in the event, a start being made from College Green, Dublin. The route to be taken is as follows: Inchicore, Rathcoole, Kill, Nass, Newbridge, Kildare, Monasterevan, Ballybrittas, New Inn, Maryborough, Mountrath, Castletown, Borris-in-Ossory, Roscrea, Dunkerrin, Moneygall, Toomyvard, Nenagh, Killaloe, the distance being about 110 miles. The run is being organised by the Shannon Development Company, and will, we hope, be a great success. In connection with this it will interest owners of motor-cars on this side of the Irish Sea to know that the rate charged for conveying motor-vehicles between Holyhead and Dublin by the London and North Western Railway service is 33s. 3d. for the first ton, and 10s. 5d. per quarter ton afterwards. The motor-vehicles have to be at the dock at Holyhead not later than 5.30 p.m. for shipment by the boat which leaves there at 6 p.m. They are "slung" on board, and are stowed on deck and covered with waterproof sheets.

A Procession in the West End.

NEARLY every Metropolitan suburb has had its carnival and procession in connection with one or other of the War Funds, and now it is announced that Thursday, July 12th, the Badge Committee of the National Bazaar, which was opened by H.R.H. the Princess of Wales at the Royal Palace Hotel last month, will hold a carnival and pageant procession which will pass through the West End and City. The committee of the National Bazaar have expressed the hope that members of the Automobile Club who own motor-vehicles will take part in the procession. As this is likely to be a very important affair, and the route will be through the City as well as the West End, it should provide a good opportunity of bringing the automobile prominently before the public, and this, as well as the meritorious object of the procession, should influence members to join in the parade. In order that Mr. Johnson may have an idea of the strength of the automobile contingent, those willing to enter their cars should send their names and a description of their vehicles to the Secretary of the Club as early as possible.

A Demonstration for Mechanical Engineers.

THE discussion on the paper on "Road Locomotion," which was recently read by Professor Hele-Shaw before the Institution of Mechanical Engineers, is to be resumed on the 27th inst., in connection with the annual summer meeting of the institution. At the suggestion of Professor Hele-Shaw the committee of the Automobile Club is inviting owners of motor vehicles, and especially owners and manufacturers of motor vehicles designed for heavy loads, to take part in a display of automobiles in St. James's Park at 12.30 p.m., on Wednesday next. Owners

and manufacturers who may be willing to show vehicles on this occasion are requested to communicate without delay with the secretary of the Automobile Club.

The Prince's Car.

CONSIDERABLE interest seems to have been taken in the full account we were able to give last week with regard to the new car of the Prince of Wales, and already some curious errors have crept into the press. Thus the *Electrician* said the car was built in this country "but with French-made under-frame and wheels." Where that information was obtained we know not; but it certainly is inaccurate, as every part was made in England—a fact which we have already emphasised. Another paragraph appearing in a London evening journal and copied into several provincial papers stated that the Prince "had an experienced driver from the Royal Mews" in attendance on his motor-car, a statement that may have had its origin in the fact that a groom was sent from Windsor to Ascot to show the way to the mechanic on the car; but had almost at the outset to give up the pilotage and return to the royal borough alone.

Motor-Cycle Race Meeting.

As announced in our last issue, a motor-cycle race meeting is (subject to there being sufficient entries) to be held at the Crystal Palace on Saturday, the 30th inst., under the auspices of the Automobile Club. The following is the programme which it is contemplated to carry through:—At 3.0 p.m., the *Autocar* challenge cup one-hour scratch race, for motor-cycles; open to all classes and all comers. At 4.15 p.m., the *Motor-Car Journal* challenge cup five-miles race for touring motor-cycles. At 4.50 p.m., the *Automotor* challenge cup ten-miles handicap, for motor-cycles; open to all classes and any machine. At 5.45 p.m., three-miles handicap, for motor-cycles, for members of the club only, for Mr. Campbell Muir's silver cup. Medals will also be presented by the Club to the first and second in each of the four races. No meeting will be held unless a total of at least ten separate entries is made not later than Saturday, the 23rd inst. The entrance fee for each race is 2s. 6d. It should be noted that it will be necessary for competitors to register themselves and their vehicles with the A.C.G.B.I., under whose rules the competitions are to be held. Among those who have already registered and notified their intention to race are: Messrs. S. F. Edge, Chas. Jarrott, Frank Wellington, and S. J. Cusins. The handicapping will be undertaken by the Competitions Committee of the Club.

Another Long Non-stop Run in Contemplation.

run of 500 miles. No definite date or route has as yet been fixed for the experiment, but we understand that the start will be made from Edinburgh.

The Bournemouth Motor-Buses.

SOME time ago we referred to the peculiar action of the Horse Committee of the Bournemouth Corporation in attempting to make the local motor-omnibuses go along a road where the traffic was not sufficient to pay a profit to the proprietor. Now the Council has endorsed the action of the Committee, and has threatened to revoke the licences unless the cars run the whole of the distance decreed by the Committee. This, it seems to us, is carrying the prejudice against motor-cars rather too far. Some authorities have refused licences altogether; others are apparently endeavouring to impose conditions that are irksome and unnecessary.

An Adventure in France.

MR. H. G. HARRIS, of Calne, went to Paris recently and bought a motor-car. It was sent to Boulogne with the intention of being conveyed to Folkestone by steamer. Having a few hours to spare at the French resort, he decided to have a spin along the road skirting the shore. Accompanied by a friend, he went along gaily until they lost control of the car, which sent them into the roadway, and Mr. Harris had his shoulder dislocated. The car was returned to Paris for repairs. Mr. Harris had better have bought his car on this side of the Channel.

Tours.

WHEN shall we have motor-vehicle tours on such lines as those mentioned last week as being run from Paris? British railway companies are becoming enterprising so far as railway trips in combination with coaches and river launches are concerned, and a week's coaching tour from London to Stratford-on-Avon is now announced. Public motor-vehicle services are doing well in many places, and popular prejudice is steadily disappearing. Hence our reiteration of the suggestion that there is a good opening for motor-car tours to be conducted on a commercial basis.

In the Eastern Suburbs.

EPPING FOREST and the district round about is a strange land to motorists generally, and yet there are many miles of beautiful roads and delightful scenery in the ancient woodlands. Unfortunately the roads to the Forest are not of the best, and to approach it from the Snarbrook direction means four or five miles of the worst travelling in the Metropolis along the Mile End and Bow Roads onwards to Forest Gate, where turning into the Woodgrange Road the motorist will come upon the best cycling road in the eastern suburbs, and then the way to the Forest is easy and pleasant. Motor-cars are scarce at present in the locality, and even at the great Woodford cycle meeting on Saturday they were few in number. There are a few residents of Forest Gate owning motor-tricycles, and one has a quadricycle; while at least a couple of the local doctors were at the last Agricultural Hall exhibition on the look-out for vehicles—evidently neither has yet been satisfied as to his requirements being met. While mentioning this, we ought not to omit a reference to a little book on the history of the neighbourhood just published by Mr. Thomas Burleigh. It is written by Mr. A. P. Crouch, and its perusal should materially add to the interest of the motorist taking a trip in the region between the Forest and the Thames—once the haunt of Dick Turpin, and other notable persons, now a series of interminable rows of houses with only a few green lanes between. But it is one of the ways into some very pleasant, though flat, country in Essex—and as such can be tolerated.

The Motor Vehicle Users' Defence Association.

A MEETING of the committee of this Association was held on the 8th inst., and amongst those present were:—Major Holden, R.A., in the chair, and Messrs. T. W. Staple, Firth, S. F. Edge, R. E. Phillips, C. Cordingley, C. Johnson, J. J. Mann, and F. F. Wellington. Mr. G. R. Helmore mentioned that there had been a large accession of members to the Association, and that several cases had been reported by members and satisfactorily dealt with. A considerable amount of general business was done, and a vote of thanks to Major Holden concluded the meeting.

Automobiles as Household Effects.

A RECENT inquiry of Mr. J. R. Roosevelt, of New York City, as to the status of the motor-vehicle before the customs laws, has brought out a ruling from the department. He wished to know whether an automobile, which he desired to take to England with him to use there for a few

months, could be brought into the United States again free of duty under the provision of the tariff law regarding the free reimportation of personal effects taken abroad by residents of the United States. In reply to this inquiry the department has decided that as the automobile in question is of foreign manufacture, it would be liable to duty on reimportation within a year. If used abroad, however, for one year or more, it would be entitled to free entry as a household effect. While the automobile is not to be regarded as a personal effect, within the contemplation of the tariff act, it may be classed as a household effect.

Scotch Motor-Car Services.

"STANDS Scotland where it did?" is a question that has often been asked and answered affirmatively. Now, however, northern Britain is going faster than of yore, and is taking to the motor-car with enthusiasm and profit. The first of the motor-cars secured by the Banchory and Strachan Autocar Company, Ltd., has just been delivered to the purchasers, and the service was inaugurated on Monday of last week. A few weeks ago the directors concluded an arrangement with Stirlings, Limited, of Hamilton, for a large and comfortable motor-car suitable alike for the accommodation of passengers and the conveyance of luggage. The car, having run swiftly and smoothly all the way from Hamilton, reached Finzean on Saturday, the 9th inst., where it attracted much attention. The vehicle is now in service between the Sawmill, Finzean, and Banchory Station, the journey occupying 1 hour 25 mins. Stoppages are made *en route* at Boghead, Birse, Whitestone, and Strachan. During the last few days, too, the Aberdeen District Motor Service Company, Ltd., has inaugurated its motor-car service to Torry and the Aberdeen sea beach. It is intended to have four cars in the service, two of which have been delivered, the other two being still in course of construction. This service has been started with the sympathy of the local authorities, and at the opening run Baillie Taggart announced that he had seen Lord Aberdeen, who was willing to encourage a service to Methlick, and would allow passengers to have a walk through the policies of Haddo House. We hear that a public service of motor-vehicles is also in contemplation at Montrose, and altogether the present year is likely to witness a great development in the use of automobiles for the conveyance of the Scotch public.

"Punch" and Motor-Cars.

Punch appears, judging from the frequency with which automobile illustrations are now appearing in its pages, to be quite a convert to the motor-car and to have fully caught the enthusiasm of motoring. Only the other week we referred to the picture of a gentleman going to Epsom on his motor-voiturette, but taking his horses with him as a precaution, while in the current issue we notice a sketch of a hooded motor-car travelling rather slowly on a country road, the cause of the "crawl" being that the driver of a loaded farmer's cart had calmly attached his vehicle to the automobile by a rope. "If your car," says *Punch*, "suddenly appears to drag heavily you may be sure there is something to account for it!"

Knowledge Wanted.

"CARLO," whose "Motor Notes" in the *Star* are of a very general character, complains that "there is an absolute absence of any special endeavour to cater for business cars, the whole idea being to get excessive speed." And then he goes on to say, "I look in vain for any firm making, say, a special doctor's carriage, or a tradesman's delivery van, or a commercial traveller's vehicle. Motor dust-carts, water-carts, etc., are simply non-existent." If "Carlo" would glance through recent issues of this journal, he would see illustrations and descriptions of vehicles eminently suited—some of them especially designed—for the purposes he names. Several travellers now do their commercial

journeys on motor-vehicles, scores of doctors are employing light cars, and tradesmen's motor delivery vans are to be seen in all the big cities and towns. Firms are making special vehicles for particular purposes, and "excessive speeds" are hardly ever thought of by manufacturing firms in England, who realise that reliability and serviceability are the requirements of users here. As for "motor dust-carts, water-carts, etc., being non-existent" "Carlo" had better go to Chiswick and Chelsea, and see such vehicles in actual operation, or make inquiries of the firms in Great Britain who are making such vehicles.

The Manchester Automobile Club.

THE second run of the members of this club is to be started to-day (Saturday). The members will not meet in Manchester, but are making their rendezvous to-night at the Glyn Valley Hotel, Glynecirog, near Chirk. On Sunday a run will be held to some places of interest in the neighbourhood, Lake Vyrnwy and Falls of Ceiriog, the party returning to Manchester on Sunday afternoon or Monday morning.

Matrimony and Motor-Cars.

WEDDINGS in which the motor-car has figured have been freely recorded during the last few years, but, perhaps that occasioning most interest in automobile circles has just taken place. In a wedding which took place last week, the contracting parties were connected with the industry, Mr. Leverett, of the S. S. Motor Company, being married to the daughter of

Photo by]

[Mr. E. Seemell, Crouch Hill.

Mr. Chant (a director of Messrs. Hewetsons, Limited). A large number of guests were conveyed to and from the church in a Benz motor-wagonette, and everything went well, the various pairs of greys employed with the other carriages looking on the motor-vehicle with apparent unconcern. We give a photograph of the wagonette drawn up at the house to receive its passengers.

Heavy Motor Traffic.

LIVERPOOL has been to the fore with regard to heavy motor traffic, and now it is a Liverpool paper—the *Liverpool Journal of Commerce*—which is the first of the general Press to have a regular service of notes on goods transport by motor-vehicles. These notes appeared on Tuesday and will be published every alternate Tuesday. Judging from the first instalment they are written by someone of ability and independence, and should be useful in arousing the interest of local commercial men in the trials organised by the Liverpool Self-propelled Traffic Association next year—trials which, as already announced, will be followed by the inauguration of a regular service of transport by road from Liverpool to the great towns of Lancashire.

Out Texas Way.

THE cowboy is threatened, and the ranchman of the Western States is losing his individuality! On one of the ranches of Texas an automobile is being employed with success; although at the first venture it did great havoc among the cattle, exercising "force at a distance" in a very great degree. The first run of the vehicle was through a large pasture in which about fifteen hundred head of cattle were grazing. These cattle had no fear of men on horseback, but when they caught sight of the horseless machine making towards them they stampeded and tore across the pasture in a solid body. When they reached the wire fence on the opposite side of the pasture they went right through it. Many of them were cut and injured by the barbed wires. The driver returned to the ranch headquarters as fast as the automobile could carry him, and the whole force of cowboys was ordered out to round up the excited cattle and return them to the pasture. The stampeded herd was overtaken several miles away, and after hard work was again placed in pasture. The experience taught that the cattle must become acquainted with the automobile by degrees. For several days it was then run about the place with horses driven immediately in front of it, and the cattle are said to have gradually become used to the vehicle.

Motor-Ambulances Wanted.

IN London about 50,000 accidents occur every year and are treated at the various hospitals in the metropolis. A week or two ago 341 accidents were dealt with at St. Thomas's Hospital alone, and Dr. Heaton C. Howard suggests that an efficient motor-ambulance service might be provided for London at a very slight increase on the rates. Seeing the work that was entailed upon the ambulances during the hot days of the present month it does seem necessary that our capital should be brought to the level of New York in this respect. Probably motor-fire engines, ambulances, etc., will be regarded as essential in any modern British city or town in the coming century. Since writing the above we have learned how useful the motor-car proved in connection with the terrible railway accident at Slough. Dr. Bruce Porter, of Windsor, was one of the first medical men to render assistance to the injured. Unable to get a train at Windsor, he raced over to Slough on his motor-car, arriving there in considerably less time than would otherwise have been possible. Such an instance should decide doctors who are thinking of adopting motor-cars.

A Long Automobile Trip in Australia.

THE Thomson steam motor-car completed a successful and eventful journey of 500 miles at midday on Wednesday, the 9th ult., when it arrived in Melbourne from Bathurst, New South Wales, with Mr. H. Thomson, the inventor, and Mr. E. L. Holmes, who essayed the task of putting up a record in something new to Australia, viz., a long-distance trip on a motor-car. The start from Bathurst was delayed a couple of days, owing to heavy rains, and the effects of the rain made the travelling very heavy for a while. In one place, a bridge having been washed away, the car had to be driven across a ford, and was got through the mud with difficulty. Notwithstanding the hilly nature of a considerable portion of the route, fair progress was made throughout. The accidents were, states the *Melbourne Age*, very slight, consisting only in the breakage of a couple of small struts, which were easily replaced. Messrs. Thomson and Holmes are the first to accomplish a long motor-car journey in Australasia without the assistance of horses on any part of the way.

Motor Dust Carts Wanted.

THE Public Health Department of the City of London wanted an electrically-driven dust cart, and the Public Health Department is now suffering from disappointment. A contemporary "learns"—we like that word—"that although advertisements were inserted in all the journals likely to secure

offers for these vehicles," no inquiry was received, and the electrical engineer to the City Corporation has come to the sage conclusion that "none of the people likely to take up such a matter have considered what excellent conditions a dust cart service offers for the use of electricity." Firstly, advertisements were not inserted in all the journals likely to bring forth replies, for our advertisement manager mentions the name of a paper familiar to our readers as well as ourselves, in which no such advertisement appeared. Thus it will be seen that neither the resources of civilisation nor the means of publicity have been exhausted. Unsuccessful in their quest for an electrically propelled dust-cart, why will not the Public Health Department be content with a steam propelled vehicle? These are now being operated with conspicuous success, and would prove economical in the City of London, where rapidity of street cleaning is an essential factor in the removal of refuse.

Hill-Climbing Contest.

GODSTONE GREEN is a charming Surrey village nineteen miles from London and two miles from the railway station at Caterham, and among its local attractions is Tilburstowe, where, on the first Saturday in July, an open hill-climbing contest will take place under the auspices of the English Motor Club. The competitors will be divided into classes, the division being ruled by the list price of the motor-vehicles entered. Entrance fees—10s. for cars and 5s. for motor-cycles—should be sent to Mr. F. W. Bailey, hon. sec., 94, Oakfield Road, Anerley, S.E. We understand that the length of the rise is 972 yards, and that the gradients are now being ascertained.

The Lyndhurst Accident.

THE unfortunate accident near Lyndhurst to Mr. Martin D. Rucker's car has, we hear, considerably alarmed local people, and the death of Mr. W. F. Orriss, who was a passenger, has added to their fears. Unfortunately a number of wild stories as to the speed of the car have got about in the district, but the result of the inquest should do something to dispel these. It is clear that the accident could not be attributed to the vehicle. At the inquest the cause of the mishap was held to be due to the gradient in the road, which apparently sloping awkwardly would upset the calculations of almost any driver. In fact, the wonder is that accidents have not been more frequent at that point. With regard to the sad death of Mr. Orriss this was attributed to a clot of blood on the heart. For some days after the accident he had been making steady progress towards recovery, and his death was unexpected.

Electric Batteries.

IN their useful "Model Engineer" series of handbooks Messrs. Dawbarn and Ward, Limited, have just issued a little volume on "Electric Batteries: How to Make and Use Them," which will be of service to amateur electricians, and even to those whose knowledge and experience has taken them into the more extended scope of the professional. The book is divided into five chapters, the first being largely introductory, the second dealing with types of batteries, the third on how to make an eight-cell bichromate battery, the fourth on non-polarising bichromate batteries, etc., and the last on the arrangement of cells in groups. Simple language has been used throughout the sixty pages into which the work is compressed, and altogether it is a book that should prove of usefulness to students of electrical matters.

MR. ARTHUR BALFOUR has taken to the motor-car. He made a trial trip from the House of Commons on Wednesday, in company with Mr. Scott Montagu, M.P.

THE Canadian Steam Carriage Company has just been incorporated in Toronto with a capital of £50,000, to manufacture automobile carriages, etc.

The Gordon-Bennett International Cup Race.

(From Our Own Correspondent.)

1, Charron (France), in 9 hrs. 9 min. 49 sec. ; 2, Girardot (France), in 10 hrs. 36 min. 23 sec. ; De Knyff (France), Jenatzy (Belgium), and Winton (America) abandoned ; Caters and Lefebvre (Belgium), and Eugen (Germany) non-starters.

SUCH is the result of the first race for the International Cup, and to see the French representatives returned winners will occasion no surprise in automobile circles. Unfortunately for the success of the race, the very greatest uncertainty existed as to whether it would be run off on the selected day ; indeed, it was not until the Tuesday afternoon

and the Place Martroi the local race commissioner was patiently awaiting the arrival of the cars before the Hotel Berry, which is in quite another part of the city. In the majority of towns an occasional notice intimated the approximate hour at which the racers would pass, but beyond this there was no other indication, and the competitors complain strongly of the trouble experienced in ascertaining the route, and the time consequently lost. Another effect of this uncertainty was the loss of a great deal of the international aspect of the race. On Wednesday afternoon the Belgian contingent intimated their intention not to compete, giving as their reason

MR. WINTON BETWEEN ST. JEAN-DE-LA-RUELLE AND ORLEANS.

M. JENATZY BETWEEN ST. JEAN-DE-LA-RUELLE AND ORLEANS.

M. CHARRON NEAR LE GRAND ORME.

M. GIRARDOT BETWEEN LE MOULIN CHOIX AND LE GRAND ORME.

before the event that the International delegates came to a definite decision. Then on Wednesday evening the Mayor of Saint-Symphorien (Eure-et-Loire) notified the "A. C. F." that he would not permit the racers to pass through his town, and it was only after a long and eloquent telephonic pleading that he consented to remove his embargo. All this had the effect of seriously disturbing the work of the Sports Committee, the incompleteness of which was manifest from end to end of the course. Insufficiency of route directions was one of the most serious failings, for in traversing some of the larger towns the competitors had to find their way as best they could. This was strikingly exemplified at Orleans, where at the moment that Girardot was passing through the town by the Rue d'Illiers

the "A.C.F.'s" non-adherence to the regulations governing the race. They contended that the rule which stipulates that the exact date of the contest shall be fixed by common accord between the clubs interested had not been complied with, and later on this view was also taken by M. Eugen, the German representative, who, by reason of the short notice accorded to him, was unable to start. This latter gentleman's car was a 15-h.p. Benz, and as it was only credited with a speed of about 50 kilometres per hour its chance of winning was microscopical. As for the Belgian team, their mounts were 30-h.p. Bolide cars, with a stated maximum speed of from 90 to 105 kilometres per hour, but all three were actually in the railway station last Thursday morning, having only just arrived from Belgium. Cer-

tainly a Belgian representative, Jenatzy, eventually started, but it was not upon the car he intended to drive, and his object in competing was motivated by the desire to save the deposit of £120 lodged with the "A. C. F." Of course, the short notice had also a considerable effect upon the French team and their cars, but in a less degree. As ultimately proved, the three Panhard racers were by no means *au point*—indeed, they did not make their appearance at Charron's *garage* until late on Wednesday evening, although expected to arrive during the morning. No, the first Gordon-Bennett cup race has not achieved the success that automobilists all the world over were hoping, and when the second is run it is to be sincerely desired that circumstances will permit of the arrangements being so perfected that the somewhat unhappy recollections of the first contest will be entirely effaced.

THE START.

The scene of the start was at the entrance to the Park of Saint Cloud, which lies between the latter town and Ville d'Avray on the road to Versailles. A great number of automobilists and cyclists had left Paris late on the previous evening, and after spending a pleasant hour or two at the Châteaux du Cycle, in the Bois, they proceeded up Suresnes' steep hill to the *contrôle de départ*. By three o'clock the crowd numbered fully three hundred persons, and the scene was particularly picturesque and animated. The huge racers, appearing larger than ever in the dim light of early morning, the hurrying *chauffeurs*, and the flock of cyclists carrying Chinese lanterns made up a picture interesting in the extreme. Of the competing cars, the American vehicle, with its single-cylindere motor, seemed puny beside the three gigantic Panhard racers; but all the same, it had a businesslike appearance, which gave hopes of a close contest, at any rate over the earlier stages of the route, for its light aspect made experts doubt its ability to last the course right out. The car weighs some 720 kilogs., and its motor develops 23 horse-power. The new Panhards weigh 1,100 kilogs., and their engines are said to develop 27 horse-power, but this is probably a very inside estimate. Ranged up as they were for the start, and with the length of car between each, the competitors were:—

1. René de Knyff (France).
2. Jenatzy (Belgium).
3. Winton (America).
4. Charron (France).
5. Girardot (France).

It was at 3.14 a.m. that the Comte de Chasseloup-Laubat despatched them on their journey, and De Knyff and Winton getting under way somewhat slowly, Girardot and Jenatzy took an immediate lead, the order at the famous Grille de Picardie being Girardot, Jenatzy, Charron, Winton, De Knyff. The competitors did not dawdle through Versailles—subsequent result, all summoned—and at the Grille de Buc the order remained unchanged, except that Winton had dropped into the last place. By the time Chevreuse was reached Jenatzy had burst both of his back wheel tires, which is not surprising when his partiality for taking corners at sixty kilomètres an hour is remembered. At Limours the official times were:—

	H.	M.	S.
Girardot at	3	49	15
Charron at	3	52	0
De Knyff at	3	53	30
Winton at	3	59	0
Jenatzy at	4	29	0

All the competitors suffered from tire troubles, and just after passing Chartres De Knyff's chance of winning was destroyed by the breakage of his fourth speed gear. At Châteaudun, 125 kilomètres from the start, Charron had secured a ten-minutes lead from Girardot, while Winton was hopelessly in the rear with a damaged wheel and a punctured tire. The leaders were travelling well, and a considerable crowd had assembled to cheer them heartily as they disappeared down the road to Orléans.

AT ORLEANS.

ORLEANS, at no time a beautiful city, is certainly not seen at its best at three o'clock in the morning, and in this respect it in nowise differs from the great majority of towns, for it is at

that miserable hour, when the night is no longer night and the day has not yet commenced to be day, that everything has a truly forlorn and pitiful appearance, whether viewed by the individual seeking his bed or by the man who has just forsaken it. Personally, I am convinced that nothing but the possibility of seeing an automobile race would induce me to come under the latter category, for frankly speaking I am neither an advocate nor a practiser of early rising. Many people have dilated to me upon the delights of seeing the sun's early efforts to illuminate the cold dark earth, but the sun's eccentricities do not appeal to me not one little bit, and I wouldn't get up early to see him, not even at his personal request. But each to his tastes, and the man who loves to gaze upon the early sun probably considers me mad to lose a night's repose for the sake of witnessing half a dozen panting, snorting motor-cars go by at express speed. Add to that the strong possibility of seeing nothing at all, for at Orléans last Thursday morning nobody knew the exact route by which the racers would traverse the town, and I can well imagine that the sunny man would consider my case as hopeless. Anyhow, I was out and about at three o'clock in the morning searching for the route, and I can assure you that there were not many people at that hour to aid my efforts. Certainly there was a man who carried a basket of strawberries on his head, but if he was a fair sample of the Orléans strawberry men all I can say is that they don't take much interest in automobilism. He didn't know that there was a race, and incredible as it may appear he had never even heard of Gordon Bennett or of the International Cup. It really is extraordinary in what a profound condition of ignorance some people live, for granted that the members of the strawberry profession have no necessity to study the automobile trade in detail, still one would think that their sporting instincts would prompt them to follow with interest the various events of the racing season. You will naturally say, "But why all this difficulty in finding the route? Didn't you ask a policeman?" No, I did not, gentle reader, and for the simple reason that there was not one to be seen in all the length and breadth of Orléans town. I learnt later on that the Orléans police become dreadful sleepy at about eleven o'clock at night, and as it is never pleasant to walk about alone in the streets after that hour they just go to bed in order to awake fresh with the lark at ten o'clock on the following morning. Robert is the same all the world over when he gets a chance! Well, after a long and trying search, I discovered the Faubourg St. Jean, and knowing that it led to the route de Châteaudun, by which the cars must arrive, I followed it, and upon reaching the city gate I saw for the first time that I was on the right track, for there, stuck upon the wall, was an "A. C. F." notice, beginning, "Les habitants sont prevenus qu'une course," etc., and concluding with "charretiers et voituriers sont instamment priés de prendre bien exactement leur droite." Good, that tranquillised my troubled spirit, and if further assurance were needed the passage of a flock of cars, *en route* to see the race at Ormes, afforded it. Away out into the country I tramped, and had reached and rested a good forty minutes at the tiny hamlet of Le Moulin Choix before away in the distance was heard the Maxim-like sound of a big racing machine. I looked at my watch, which showed 5.7, and inwardly remarked, "By Jove, they are travelling in spite of all the local regulations," for to cover some 163 kilomètres in 2hrs. 7min. means fast going. The noise continued for perhaps a minute, then ceased as the car ran behind an intervening hill only to break forth with redoubled vigour as the racer's nose showed above the crest of the hill and dashed down towards us. The local enthusiasts sent up a howl of despair. The car was red! America's colour! But as she whizzed past us I recognised the grim countenance of M. Levegh, and was able to reassure the group of villagers that it was no American invader who was leading the way, but merely a French automobilist whose car the "A. C. F." had not considered good enough to represent "la belle France." As Levegh was travelling at some 90 kilomètres an hour the effect of my explanation was that the good people of Le Moulin Choix fully anticipated seeing the actual representatives of their fatherland fly rather than drive past, and when thirty-five minutes later M. Girardot hove in sight they were visibly disappointed

at his moderate gait of about fifty-six miles per hour. It was near to Le Grand Orme that Girardot passed us, for we had walked back a couple of kilomètres, and five minutes after he had disappeared down the long, level stretch of road, Charron arrived at express speed. Never have I seen a car travel so fast on level ground as did that of Charron's last Thursday morning at Le Grand Orme, and I have seen some few races too. She simply flew along, and then at St. Jean de la Ruelle she struck the *caniveau* traversing the route close to the Mairie, and was pulled up with a back axle bent almost double and a pump badly wrecked. By the time I reached the scene of the mishap Charron had roughly effected repairs and set out again, but very slowly, and no one anticipated that he would finish the race. We then procured and hoisted a green flag some thirty yards before the *caniveau*, and this, aided by plenty of shouting, had the effect of reducing De Knyff's speed to walking pace ere he reached the dangerous spot. A wave of the hand from De Knyff, and off he went again, but not at the pace at which he usually races, and it was obvious from that and the grinding sound made by his car that something was amiss. Jenatzy was the next comer, and he also was not travelling well, while the car of Mr. Winton, the whipper-in, presented a woe-begone appearance, with a buckled front wheel and a collapsed tire. A long tramp brought me back to Orléans, where I heard of Girardot's accident as he was leaving the town by the Porte de Bourgogne. A frightened horse, a sudden swerve, and the back wheel broken against a kerbstone, such briefly the story of Girardot's mishaps. This resulted in a loss of some eighty minutes to him, but for which he would doubtless have made a desperately close finish with Charron. It was here, too, that Mr. Winton decided to abandon the contest, and it is quite possible that had not the Comte de Chasseloup-Laubat been at Orléans and told Charron how matters stood he too would have discontinued. The official returns at this point, 173 kilomètres from the start, were as follows:—

	Name.	Time.	Average.
1.	Girardot	5.53	60.0 kilomètres
2.	Charron	6.10	58.9 „
3.	De Knyff	6.49	48.2 „
4.	Jenatzy	6.52	47.6 „
5.	Winton	8.30	—

Between Orléans and Gien there are 63 kilomètres, and at the latter place Charron arrived at 7.15 a.m., followed by Jenatzy at 8.25 a.m., and Girardot at 8.45 a.m., their respective average speeds per hour being 58.70, 45.00, and 42.70 kilomètres. Here de Knyff, who had, previous to reaching Orléans, decided to abandon the race, actually quitted the route and returned to Paris with MM. Krebs and Chasseloup-Laubat. At Nevers, 322 kilomètres from the start, Charron was a long way ahead of Girardot, and his average speed per hour was 59.60 kilomètres as compared with the latter's 47. Jenatzy had dropped into the last place of the three remaining competitors—tire, gear, and ignition troubles worrying him incessantly. Fifty-four kilomètres further on, at Moulins, Charron found Huillier and Levegh awaiting him, and they lent a willing hand in refilling his petrol tanks. At that point the ultimate winner's average speed had advanced to 60 kilomètres per hour. Girardot arrived an hour and a-half later, and after rapidly replenishing his petrol tanks he also made haste for Lyons. As for Jenatzy, he was hopelessly *en panne* some few kilomètres outside the town. At La Palisse Charron passed through the town at 10.9 a.m., and Girardot at 11.44, while at Roanne, 49 kilomètres further on (476 kilomètres from the start), the former arrived at 10.56 a.m. and the latter at 12.34. From La Palisse onwards the route became very hilly, with numerous nasty turnings, until the last 12 or 15 kilomètres into Lyons had to be negotiated, where the road was excellent. It was here that Charron met with an extraordinary accident. When travelling at nearly 100 kilomètres an hour a large dog ran right in the way of the car and became wedged between the steering gear and the springs. The vehicle swerved violently to the left passed between two of the trees bordering the route, descended into the ditch, mounted again, and continued its course down the road. And the dog was dead! And so was

the pump pretty nearly; for Fournier, who was with Charron had to hold it in place for the remainder of the journey.

THE FINISH, AT LYONS.

From ten o'clock in the morning a crowd of automobile enthusiasts had congregated before the hospitable doors of the "Délices de la Demi-Lune," that restaurant situated on the Arbrecle route, and so well known to all the *chauffeurs* and cyclists of Lyons. The members of the local automobile club had turned out in great force, and they were supported by many well-known motor-men from all parts of France. There was M. Giraud, fresh from his excellent performance in the Bordeaux-Périgueux race; M. Stead, back from Nice; Captain Insmore and the secretary of Mr. Winton, representing America; M. Clément, who drove out with M. Eldin; MM. Brun, Santoux, Maze, and a hundred others. Had the melancholy finish of the race been anticipated, I doubt whether the attendance would have been so large, for while recognising the superiority of the French cars, still a semblance of a struggle was expected. But not a bit of it. The race was but a race in name, and not a particle of excitement could be worked up over the arrival of but two competitors, and these two representing the same country, and separated by the trifle of an hour and a half. Charron reached the contrôle at 12.23 in a considerably exhausted con-

M. DE KNYFF AT "CANIVEAU" AT SAINT JEAN-DE-LA-RUELLE, WHERE ACCIDENT TO CHARRON OCCURRED.

dition, while his *mécanicien*, Fournier, was even more done up, having been required to hold in place a damaged pump during the last twelve kilomètres of the course. Girardot arrived at two o'clock, and after that, although anxiously awaited, no other competitor put in an appearance. What a tame conclusion to what promised to be a terrific race! But there it is; and we must wait a twelvemonth ere we again have an opportunity of seeing a contest for the Gordon Bennett cup. Will France again retain it so easily? Time will show.

THE Glasgow and West of Scotland Motor Car Company, Limited, is being voluntarily wound up.

It is stated that a new voiturette is in course of construction at the works of the Société L'Énergie, in Paris. It is to be fitted with a 5-h.p. Renault water-cooled motor, and will have three speeds and reverse motion.

A TWO-MILES motor race was run at the meeting of the Beeston Cycle Club, at Nottingham, on Saturday last. Mr. H. Belcher, from the 100 yards mark, came in first, and Mr. G. Hunt, the old long-distance cycle rider, was second off scratch.

THE Manchester Motor-Car Corporation, of Victoria Bridge, Manchester, the Lancashire agents of the Motor Manufacturing Company, have secured an order from the Ridgfield Cycle Company, of Manchester, for an Iveagh phaeton. It will be remembered that a car of this type, made by the Motor Manufacturing Company, ran exceedingly well through the 1,000-mile Trial, making its full average each day.

TOURING NOTES.

BY A WORLDLING.

KENT—has not someone called it “the Garden of England?”—is an ideal playground for the London *chauffeur*. I met at Margate the other day a friend who has been touring through the county on one of the new 10-h.p. Mors phaetons. He spoke with equal enthusiasm of the scenery and of the car that made it so easy for him to see it.

It is a delightful run from town to Littlehampton, by Epsom, Leatherhead, Horsham, and Findon, where there is a mighty hill; and it is good to find at the end of one's journey a hotel like the Beach, perfect in every respect, and the property of a keen *chauffeur* as is Mr. Whitehead, the popular secretary of the Raleigh. My friend told me that he let Mr. Whitehead's little daughter, who is not much more than ten years old, drive the great automobile from Brighton to Littlehampton, and that she managed it—on top speed, mind—with astonishing ease. This must be a record, although with a slight flaw, for in cutting a corner she broke a spoke against the curb.

I HAVE noticed that, whereas English horses behave in a singularly undignified manner when a motor-car is by, our dogs look on it with little interest and some contempt, which they rarely express with more than an indignant bark. In France the opposite obtains, for the horses understand that the automobile can do them no harm and, therefore, hardly ever shy at it, but the Gallic dogs are a regular pest. First of all, they have invented a new religion, the basis of which is that if they die while trying to kill an automobilist their souls will go to some wonderful Valhalla in which are pyramids of bones. This makes fanatics of them—witness the grim slaughter on the Cup Day, a very Omdurman for the canine Faithful. And then there is a sort of kindergarten training for the youngsters, who are taught to fling themselves with howls and yells in front of every car that passes, till some nervous driver, swerving too quickly, wrecks himself on the curb. Seriously, a big dog may cause a very bad accident; Charron might have been killed the other day when he was thrown on to the bank, and almost every *chauffeur* has had similar experiences. A whip is the best preventive—one of the colonial type, with a short handle and a heroic lash. Catch him sideways, but mind the lash does not get entangled in the chains. I remember young Prince Bibesco showing me an anti-dog contrivance, which, though thoroughly effective, does not commend itself to the Englishman. It consisted of a pistol that squirted out ammonia into the eyes of the enemy.

I HEAR that an automobile company has been formed in Mexico City, but, unless the roads in the country of the burning mountains have improved since I was there, I pity the people who, actuated by a spirit of modernity, invest in the company's cars. The city itself is well-paved, and there is a charming drive out to a place the name of which no one could be expected to remember, but which is famous for its wonderful trees covered in Spanish moss; but the more venturesome, who try the prowess of their automobiles against that of their buggies, will have a sorry tale to tell on their return. The desert over which Ernest Archdeacon had to travel to reach the oasis of Biskra in Algeria, is excellent going in comparison with the ruts and broken surface of a Mexican main road.

I CONSIDER a foot-warmer as one of the necessary extras on a touring car, and I am surprised to see that here in England, where the days are often and the nights always cold, very few *chauffeurs* go on their travels provided with this simple and comforting apparatus. I hate cold myself, especially in the hands and feet; I am, therefore, molly-coddle enough to take a muff with me when I am going for a cold run on a car driven by someone else. I learnt the value of this feminine prophylactic when shooting in Germany many years ago. The sight of a dozen members of a *verein* sitting in the snow on camp-stools with their

hands in muffs waiting for the beaten game, would make the Englishman laugh, but a warm finger is better on the trigger than a nerveless thing like a frozen stick. I introduced this “effeminate” system into the Cariboo country, and many an old trapper saw the wisdom of it; the English automobilist would do well to try it too. Fur cuffs are very sensible things to wear over one's driving gloves, as a cold wrist means a cold body.

A MOTOR - TRICYCLE AND GUN CARRIAGE FOR THE NORWEGIAN GOVERNMENT.

SEVERAL attempts have been made to introduce the use of motor-cycles in connection with the transport of light guns. In our issue of October 6th last, we published an illustration of an automobile gun carriage built by the Duryea Manufacturing Company, of Peoria, Ill., for Major Davidson, of the U.S. North-Western Military Academy. The military authorities in Norway have also been devoting attention to the same matter, and two or three months ago placed an order with the Gesellschaft für Motor und Motor-fahrzeugbau (Cudell and Company), of Aix-la-Chapelle, Germany, for a motor-tricycle and gun carriage. The vehicle has just been delivered, and by the kindness of Messrs. Cudell we are able to give an illustration of the combination. The tricycle is fitted with a 2½-h.p. De Dion motor, and except for an additional seat at the rear for a second passenger, resembles the ordinary motor “trike.” The gun carriage takes the form of a trailer, the frame being made sufficiently long so that it can receive the ammunition chest in front of the gun. Before the vehicle was shipped to Norway it was subjected to a test on the Kaninsberg, a steep hill 1½ kilometres long in the north-east of the town of Aix-la-Chapelle. The machine was mounted by a couple of soldiers from the 40th Infantry Regiment stationed in the Aix garrison, and we are informed that it mounted the hill at a good pace, many cyclists being passed *en route* pushing their machines along.

MR. ERIC CHAPLIN, son of the Right Hon. Henry Chaplin, president of the Local Government Board, has, we learn, placed an order for a 6-h.p. phaeton with the Daimler Motor Company.

A COMPANY has just been formed in Brussels with a capital of £40,000, to be known as La Société des Diligences, Courriers et Messageries Automobiles, to organise public services of motor-cars in France and elsewhere.

La France Automobile announces that the Prince of Oldenburg has lately made a journey on his Gardner-Serpollet steam car, extending to over 500 kilometres in the Caucasus. The route was a hilly one—from Novorossisk to Soukhoun.

THE Decauville Company, the manufacturers of the well-known Decauville voiturette, are said to have last year exported eighty-seven vehicles of various descriptions, two going as far away as Dutch East Indies, one to Egypt, one to Greece, and one to Manchuria.

MESSRS. R. HARRISON AND SON, Limited, is the name of a company which has been registered with a capital of £20,000 to acquire the business carried on at 1, Stanhope Street, N.W., as R. Harrison and Sons, and to carry on the business of coach, van, carriage, and motor-car builders, etc.

THE Motor Manufacturing Company's char-à-banc belonging to the Manx Cycle and Motor Company, Douglas, was kept actively employed during the recent Whitsuntide holidays. During the week two trips to Peel and back were made daily, while in the evening runs were made from end to end of Douglas promenade.

THE Hastings and East Sussex Motor-Car Syndicate, Limited, has been registered with a capital of £5,000 to adopt an agreement with A. H. Collins, D. Russell, H. Broadhurst, and H. A. Pearch, and to carry on the business of tramcar, omnibus, motor-car, and van proprietors, motor-car builders, etc. Registered without articles of association.

THE NAPIER MOTOR-CAR.

IN view of the success achieved by Mr. E. Kennard's 8 h.p. Napier car in the Automobile's Club's recent 1,000-mile Trial it was thought that a few details of this type of vehicle would be interesting to our readers, and with the view of gleanings the same a representative of the *Motor-Car Journal* recently spent an hour or so at the works of Messrs. Napier and Co., in Vine Street, Lambeth, where he had an opportunity not only of inspecting Mr. Kennard's 8 h.p. car but also a number of others of similar power, and a few of 16 h.p. in course of construction.

To deal first with the Napier motor—the standard one is of the vertical two-cylinder type. The cylinders have a diameter of 4in. by 6in. stroke, and at the normal speed of from 750 to 780 revolutions develop rather over 8 h.p. The cylinders are water-jacketed; the cylinder top is of special construction, which enables it to be connected to the cylinders proper by a gas joint, made simply by means of brown paper and boiled oil. The water-jackets around the cylinders and the cylinder top are quite distinct, so that no leakage of water at the joint is possible, the water connection between the two jackets being made by an outside pipe. A

radiating coil of the Loyal type is provided in connection with the water circulation. The ignition is electrical, the sparking plug being that introduced into this country by the United Motor Industries, and known as the "Reclus." The ignition is variable by means of a timing device with rubbing contacts, on the lines of that adopted in the De Dion tricycle. The inlet and exhaust valves are so

fitted that they can be removed at very short notice. Indeed, we were surprised at the rapidity with which Mr. Napier performed the operation in order to show us the special three-port inlet valve he employs. The workmanship of the motor is of the highest class, and as showing the care that has been paid to the details it may be mentioned that the wrist-pin in the piston is made of a special taper form, so that any wear can be readily taken up. The carburettor employed is of the Phénix type, but it is provided with a hot-air jacket to facilitate the carburetting operation. The crank shaft works in an oil-containing case, and we also noticed that the half-speed gear controlling the exhaust valve is located within this case instead of outside as is the case in many cars.

Coming now to the transmission mechanism, this, generally speaking, follows the arrangement adopted in the Panhard and Daimler cars, the motor driving a longitudinal shaft geared by spur wheels to a small counter-shaft, which at its end carries a bevel gear. This latter wheel conveys the power to a differential cross shaft, which is connected by the usual sprocket wheels and chains to the rear axle. There are four speeds forward and reverse motions, controlled by hand levers at the side of the car. While following the general lines of the Panhard car as regards the transmission, Messrs. Napier

have made certain alterations in the strength and size of the gear wheels, with the view of increasing the life of the same. All the gear wheels are steel forgings hardened, and they work in an oil-containing gear box, made of aluminium. Special attention has also been paid to lubrication and to the bearings, a roller bearing being provided on the counter-shaft behind the driving bevel gear, while the differential cross shaft is provided with a double-thrust ball-bearing. In the 16 h.p. cars roller bearings are being adopted throughout in the transmission gear. Steering is controlled by an inclined hand-wheel actuating a worm gear, enclosed in a protective casing, and provided with an adjusting device to take up any wear. A foot pedal controls a band brake on the differential cross shaft, while there are double-acting band brakes operated by a hand lever on drums attached to the hubs of each of the rear wheels; both brakes are so arranged that when applied the friction clutch connecting the motor with the transmission gear is simultaneously thrown out. The frame, which is constructed of channel steel, is so made that any type of "body" can be fitted to it; the road wheels are of wood, and are made by the Dunlop Company, this concern's 90 mm. pneumatic tires being also fitted. The 8 h.p. cars measure 8ft. 6in. by 4ft. 10in. over the axles; the 16 h.p. cars are the same width, but have

a base 10in. longer. At the time we visited the works a very busy state of affairs was prevailing, no less than about a dozen cars being in course of construction for the Motor Power Company, Limited, who control the rights in the Napier vehicles.

A SUB-COMMITTEE of the Southampton Corporation have just inspected the pattern of motor-car to be acquired by the Corporation.

A COMBINATION MOTOR-TRICYCLE AND GUN CARRIAGE BUILT FOR THE NORWEGIAN GOVERNMENT.
(For description see opposite page.)

Answers is offering a convertible quadricycle to the reader who disposes of his copy of the paper in the way that strikes the editor as the best.

LA SOCIÉTÉ DES MOTEURS ET AUTOMOBILES (RICHARD) is the title of a company which has just been formed in Brussels with a capital of £20,000.

THE Thames Valley Launch Company, Limited, of which Mr. W. Rowland Edwards, A.M.I.E.E., is managing director, announce that their charging stations at Weybridge, Maidenhead, Hurley, Pangbourne and Shillingford, are now available for charging electric motor-cars. At Oxford they can be charged by the Thames Valley Launch Company, Limited, by arrangement with the Oxford Electric Light Company.

UNDER the auspices of the Scottish Cycling Union, the Cyclist Touring Club, and the Scottish Automobile Club, a meeting was held in Edinburgh last week to consider what could be done to improve the present inadequate bye-law in regard to the carrying of lights by vehicles in Mid-Lothian. Resolutions calling for amendment of the County Council bye-law and in favour of the universal lighting of vehicles were adopted. Messrs. Newton and Alexander were appointed to wait on the Lord Advocate the first time he was in Edinburgh and place the views of the meeting before him.

CORRESPONDENCE.

THE PROPOSED MOTOR TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I cannot quite agree with Mr. Edge that a good touring car must be of bad design and want everlasting repair. Both Mr. Jarrott and Mr. Edge, I believe, are racing men of no mean order, so it is only to be expected that a motor track would seem the one ideal to them, but I think that the trade will do better to cater for the moderate speed user than to give ear to the racer in his attempts to knock off a fraction of a second. If the craze does catch on for racing I am much afraid we shall have makers cutting down every possible part for lightness with the inevitable result, and a collapse of a car at racing speed will be a serious affair, and most of the cars after a race will only be fit for the scrap heap—if one may judge by the tricycles that have broken records—tires worn nearly flat, and the canvas bare of rubber. I think, Mr. Editor, that we have had more than enough of bicycles with frames that collapse on the path, tires so thin that they could be almost pierced with a glance, handle bars bent to the most idiotic shapes that must have been the outcome of a distorted brain, and do not wish to have these abortions introduced into motor-cars. I believe the motor-car that is put on the market to supply the wants of the small trader (to replace his present horse and cart), and also the persons of moderate means who do not understand horses (like myself), will have a great sale, as there must be more of this class of customers than the racing fraternity.

I hope soon to be the owner of a car, but I shall certainly not place my order with a maker whose only claim is winning some race by a fraction of a second. I shall have a car that is good for touring, and will chance Mr. Edge's gloomy forecast as to repairs.

London, E.C., June 16th, 1900.

Yours truly,
W. T. W.TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the article on above in your issue of 2nd inst., personally I think this would be an excellent means of developing the sport. At the same time I cannot help being of opinion that the time has hardly arrived for such a step to be taken, the number of racing vehicles in this country being hardly sufficient to justify the expenditure of the necessary amount of money even if the latter could be raised.

Another point is that at present racing is not, as your correspondent says, stopped in France. Permission has lately been granted by the Minister of the Interior for the holding of the Gordon-Bennett and all other important races that have been fixed up to the present. If a track were constructed at any time I should recommend it to be made as flat as possible (except as regards the "banking," if any), and not with a hill in the middle as your correspondent suggests, for there are plenty of hills on ordinary roads, and the object of the track would, I imagine, be speed only.

London, W., June 13th, 1900.

Yours truly,
CHARLES S. ROLLS.

CHANGESPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that Mr. A. Cobb, in your issue of the 9th inst., is desirous of information in respect of the speed-changing gear fitted to the De Dion voiturette. As possibly this information may be of interest to other of your readers, I would like, with your permission, to describe it.

The speed-changing gear is placed alongside the motor, and is enclosed in an aluminium case. It is composed of two shafts, on which are placed four cog-wheels of different diameters, meshing together, and being always in gear. The first of these shafts, on which are keyed the pinions, is joined to the motor shaft by means of a coupling sleeve in two pieces. The second shaft is the one on which the throwing in and out of gear takes place. This is effected by the aid of a rack and pinion which runs through the centre of the second shaft. By moving the rack and

pinion rod one way one pair of wheels is put in gear. At the same time the other pair is thrown out. By reversing the action the gear in drive is put out and the other in. The driving is done by two separate friction clutches situated side by side, one actuating the slow speed and the other the fast speed. These are formed of divided segments of hard composition, with metal flanges, and in the centre of each there is a small pinion upon which the rack acts as it moves to the right or left, by which movement the small pinion increases or decreases the diameter of the divided segments. When the rack is moved to the left the small pinion increases the diameter of the segments which bind tightly against the inner surface of the friction case in such a way as to cause the case to drive the toothed wheel connected to it. When the rack is moved along to the right this expands the fast-speed segment, and contracts the slow, and when the rack is moved in the centre both clutches are thrown out of gear. This rack is actuated from the steering pillar by means of a toothed wheel and chain to the extremity of the shaft. Opposite the rack is fitted the small pinion which drives the large spur wheel on the main axle.

I regret I cannot send you sketches showing this more clearly, but I trust that the above description will give some idea as to the particular device in question.

Yours truly,

CHAS. JARROTT.

(The De Dion Bouton British and Colonial Syndicate, Ltd.)
14, Regent Street, S.W., June 14th, 1900.

THE DANGERS OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of June 16th, we notice a communication from Mr. R. Drake, relative to an accident in his show room, occasioned by the spirit vapour catching fire and exploding in consequence of being ignited by a Dietz automobile lamp attached to one of their motor-cars. Fearing the numerous readers of your valuable journal may gain the impression that the Dietz lamp was at fault, we wish to explain that the accident would have happened had any other lamp been employed.

There is nothing whatever in the construction of the Dietz lamp different from any ordinary lamp, except that it is made on the scientific tubular system, and the volume of light is more intense, being equal to twenty candle power.

The lesson to be learned from Mr. Drake's experience is, of course, not to draw the petrol from the tank while the lamp is alight, whether a Dietz or any other.

Green Street, Blackfriars,

London, S.E., June 18th, 1900.

Yours faithfully,

SALSBUARY AND SON.

TROUBLE WITH A BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent "Fog," I think he will find that a small bit of asbestos or other "foreign body" has got between the platinum wires of his igniter. This will not prevent the sparking at first, and will rapidly become red-hot, and will remain so by the heat of the explosions and fire just as a tube ignition system would. It would be interesting to know whether this is the case in "Fog's" car.

Rathmines House, Uxbridge,

June 20th, 1900.

Yours truly,

A. CHARPENTIER.

AN automobile mail collector is being tested in Concord, N.H., U.S.A.

PASSING through Ripley on Tuesday we learned that Mr. S. F. Edge had been there on Sunday on his 16-h.p. Napier. Mr. Jarrott was with him riding a motor-tricycle.

ARRANGEMENTS have been made by the Committee of the Sheen House Club that there should be special dinners, followed by concerts, on every Thursday evening during June and July. The dinners will take place at 7.30 p.m. Members of the Automobile Club who wish to participate in these dinners will meet at the Automobile Club at 6.30 on Thursday evenings, and will drive *via* Richmond Park to Sheen House Club.

TO ASCOT BY MOTOR-CAR.

BY PHANOMEN.

PRESSURE on the space last week prevented me from referring at length to the pleasant trip I had on Wednesday, the 13th inst., on Mr. Oliver Stanton's Daimler mail phaeton, when I journeyed as far as Ascot to inspect the Prince of Wales's motor-car. During the afternoon the weather had been of anything but a promising character, but by the time our party was ready to start the sky had cleared, and I looked forward to an enjoyable journey, which expectation was more than realised. It was just twenty-minutes to six when the signal was given "all aboard"—there being four of us altogether—and Mr. Stanton, who was at the helm, drove off from the Daimler Company's depôt in Shaftesbury Avenue, W.C., into Oxford Street. Here the heavy traffic necessitated a very slow pace, and it was not until after the Marble Arch was passed that we could increase the pace to something more than a crawl. Our progress was again quickly blocked, however, owing to the main road along the north side of Hyde

to pass us in a dignified manner. Nearing Staines we met a huge traction engine hauling a couple of wagons, and, no doubt feeling himself an automobilist of a sort, the driver duly saluted us as we passed him by. It was striking seven as we went through the pleasant river-side town of Staines, and turning to the right immediately on crossing the bridge ran along to Egham in good style. The driving just about here needs a great deal of skill, particularly when on the other side of the road there is a continuous stream of race traffic returning home, as the road dips considerably to the left. The "toot, toot" of a horn just outside of Egham warned us of the approach of a motor-car, which proved to be a Daimler wagonette, having eight or nine passengers, each wearing a white felt hat, with the brims turned down! They were returning from the races, and judging from their smiling faces and general "happy" appearance had had a good time. The long and steep Egham Hill caused our driver to push the gear over on to the slow speed, and although the pace was not fast the car got to the top without it being necessary for any of us to get out and walk, not to speak of rendering assistance in the way of pushing. As we were now approaching Virginia Water, it is needless to remark

THE DE DION 20-SEATED STEAM CHAR-A-BANC. (For description see next page.)

Park being partially closed for repaving—not, we might add, before it was necessary. This caused us to make a *détour* through some side thoroughfares; but once on the main road again our rate of progression became much quicker and a good run through Notting Hill brought us quickly to Shepherd's Bush. Here we bore to the left along the Goldhawk Road and joined the main road to Hounslow at Young's Corner, Chiswick. Those motorists who have experienced riding through that narrow, busy thoroughfare—King Street, Hammersmith—will find the route we followed a welcome change.

Once on the main road, we travelled along at a good rate, leaving Gunnersbury and Kew quickly behind. Here is Brentford, here Isleworth, now we are at Hounslow and the open country, and are reeling off the miles—say it quietly—at nearly twenty to the hour. By the time we reached Bedfont, with its quaint old church and where a fair was in progress, we began to meet quite a number of four-in-hand coaches and horse-drawn vehicles of all kinds returning from the races, and from here onwards quite a number of "hay-motors," which were apparently unused to the automobile, caused us to slow down so that they might be induced

that we were in the centre of a beautiful district. It was a glorious evening and many cottages did we pass; the walls of which were hardly discernible owing to the wealth of roses, while the long rows of huge rhododendrons all in bloom seemed endless. The gaiety of the scene, too, was heightened by the many "picnicking" parties on the roadside that we passed. The long straight run down to Virginia Water was quickly followed by an ascent, and then we turned off to the right. Our destination at Ascot was at the far end of the town, and as we ran along the High Street, thronged with people owing to the races, we met with a hearty reception. Our journey of from twenty-four to twenty-six miles occupied just a couple of minutes over the two hours, but had it not been for the heavy traffic in London and the care needed in driving along the route, owing to the coaches and other vehicles returning from the races, I should have been able to have chronicled a better record.
